This second species of displacement which occurs in dream-formation is not only of great theoretical interest but is also specially well calculated to explain the appearance of fantastic absurdity in which dreams are disguised. The direction taken by the displacement usually results in a colourless and abstract expression in the dream-thought being exchanged for a pictorial and concrete one. The advantage, and accordingly the purpose, of such a change jumps to the eyes. A thing that is pictorial is, from the point of view of a dream, a thing that is *capable of being represented*: it can be introduced into a situation in which abstract expressions offer the same kind of difficulties to representation in dreams as a political leading article in a newspaper would offer to an illustrator. But not only representability, but the interests of condensation and the censorship as well can be the gainers from this exchange. A dream-thought is unusable so long as it is expressed in an abstract form; but when once it has been transformed into pictorial language, contrasts and identifications of the kind which the dream-work requires, and which it creates if they are not already present, can be established more easily than before between the new form of expression and the remainder of the material underlying the dream. This is so because in every language concrete terms, in consequence of the history of their development, are richer in associations than conceptual ones. We may suppose that a good part of the intermediate work done during the formation of a dream, which seeks to reduce the dispersed dream-thoughts to the most succinct and unified expression possible, proceeds along the line of finding appropriate verbal transformations for the individual thoughts. Any one thought, whose form of expression may happen to be fixed for other reasons, will operate in a determinant and selective manner on the possible forms of expression allotted to the other thoughts, and it may do so, perhaps, from the very start - as is the case in writing a poem. If a poem is to be written in rhymes, the second line of a couplet is limited by two conditions: it must express an appropriate meaning, and the expression of that meaning must rhyme with the first line. No doubt the best poem will be one in which we fail to notice the intention of finding a rhyme, and in which the two thoughts have, by mutual influence, chosen from the very start a verbal expression which will allow a rhyme to emerge with only slight subsequent adjustment.

In a few instances a change of expression of this kind assists dream-condensation even more directly, by finding a form of words which owing to its ambiguity is able to give expression to more than one of the dream-thoughts. In this way the whole domain of verbal wit is put at the disposal of the dream-work. There is no need to be astonished at the part played by words in dream-formation. Words, since they are the nodal point of numerous ideas, may be regarded as predestined to ambiguity; and the neuroses (e.g. in framing obsessions and phobias), no less than dreams, make unashamed use of the advantages thus offered by words for purposes of condensation and disguise.¹ It is easy to show that dream-distortion too profits from displacement of expression. If one ambiguous word is used instead of two unambiguous ones the result is misleading; and if our everyday, sober method of expression is replaced by a pictorial one, our understanding is brought to a halt, particularly since a dream never tells us whether its elements are to be interpreted literally or in a figurative sense or whether they are to be connected with the material of the dream-thoughts directly or through the intermediary of some interpolated phraseology. In interpreting any dream-element it is in general doubtful

- (a) whether it is to be taken in a positive or negative sense (as an antithetic relation),
- (b) whether it is to be interpreted historically (as a recollection),
- (c) whether it is to be interpreted symbolically, or
- (d) whether its interpretation is to depend on its wording.

Yet, in spite of all this ambiguity, it is fair to say that the productions of the dream-work, which, it must be remembered, *are not made with the intention of being understood*, present no greater difficulties to their translators than do the ancient hieroglyphic scripts to those who seek to read them.

¹ [Footnote added 1909:] See my volume on jokes (1905c) and the discussion there of the use of 'verbal bridges' in the solution of neurotic symptoms.

I have already given several examples of representations in dreams which are only held together by the ambiguity of their wording. (For instance, 'She opened her mouth properly' in the dream of Irma's injection and 'I could not go after all' in the dream which I last quoted.) I will now record a dream in which a considerable part was played by the turning of abstract thought into pictures. The distinction between dream-interpretation of this kind and interpretation by means of symbolism can still be drawn quite sharply. In the case of symbolic dream-interpretation the key to the symbolization is arbitrarily chosen by the interpreter; whereas in our cases of verbal disguise the keys are generally known and laid down by firmly established linguistic usage. If one has the right idea at one's disposal at the right moment, one can solve dreams of this kind wholly or in part even independently of information from the dreamer.

A lady of my acquaintance had the following dream: *She was at the Opera. A Wagner opera was being performed, and had lasted till a quarter to eight in the morning. There were tables set out in the stalls, at which people were eating and drinking. Her cousin, who had just got back from his honeymoon, was sitting at one of the tables with his young wife, and an aristocrat was sitting beside them. Her cousin's wife, so it appeared, had brought him back with her from the honeymoon, quite openly, just as one might bring back a hat. In the middle of the stalls there was a high tower, which had a platform on top of it surrounded by an iron railing. High up at the top was the conductor, who had the features of Hans Richter. He kept running round the railing, and was perspiring violently; and from that position he was conducting the orchestra which was grouped about the base of the tower. She herself was sitting in a box with a woman friend (whom I knew). Her younger sister wanted to hand her up a large lump of coal from the stalls, on the ground that she had not known it would be so long, and must be simply freezing by now. (As though the boxes required to be heated during the long performance.)*

Even though the dream was well focused on a single situation, yet in other respects it was sufficiently senseless: the tower in the middle of the stalls, for instance, with the conductor directing the orchestra from the top of it! And above all the coal that her sister handed up to her! I deliberately refrained from asking for an analysis of the dream. But since I had some knowledge of the dreamer's personal relations, I was able to interpret certain pieces of it independently of her. I knew she had had a great deal of sympathy for a musician whose career had been prematurely cut short by insanity. So I decided to take the tower in the stalls metaphorically. It then emerged that the man whom she had wanted to see in Hans Richter's place *towered high above* the other members of the orchestra. The tower might be described as a composite picture formed by apposition. The lower part of its structure represented the man's greatness; the railing at the top, behind which he was running round like a prisoner or an animal in a cage - this was an allusion to the unhappy man's name¹ - represented his ultimate fate. The two ideas might have been brought together in the word '*Narrenturm*'.²

¹ [Footnote added 1925:] Hugo Wolf.

² [Literally 'Fools' Tower' - an old term for an insane asylum.]

Having thus discovered the mode of representation adopted by the dream, we might attempt to use the same key for solving its second apparent absurdity - the coal handed up to the dreamer by her sister. 'Coal' must mean 'secret love':

Kein *Feuer*, keine *Kohle*
kann brennen so heiss
als wie *heimliche Liebe*,
von der niemand nichts weiss.¹

She herself and her woman friend had been left unmarried. Her younger sister, who still had prospects of marriage, handed her up the coal 'because she had not known *it would be so long*'. The dream did not specify *what* would be so long. If it were a story, we should say 'the performance'; but since it is a dream, we may take the phrase as an independent entity, decide that it was used ambiguously and add the words 'before she got married.' Our interpretation of 'secret love' is further supported by the mention of the dreamer's cousin sitting with his wife in the stalls, and by the *open* love-affair attributed to the latter. The dream was dominated by the antithesis between secret and open love and between the dreamer's own fire and the coldness of the young wife. In both cases, moreover, there was someone 'highly-placed' - a term applying equally to the aristocrat and to the musician on whom such high hopes had been pinned.

¹ [No *fire*, no *coal*
So hotly glows
As *secret love*
Of which no one knows.]

The foregoing discussion has led us at last to the discovery of a third factor whose share in the transformation of the dream thoughts into the dream-content is not to be underrated: namely, *considerations of representability in the peculiar psychical material of which dreams make use* - for the most part, that is, representability in visual images. Of the various subsidiary thoughts attached to the essential dream-thoughts, those will be preferred which admit of visual representation; and the dream-work does not shrink from the effort of recasting unadaptable thoughts into a new verbal form - even into a less usual one - provided that that process facilitates representation and so relieves the psychological pressure caused by constricted thinking. This pouring of the content of a thought into another mould may at the same time serve the purposes of the activity of condensation and may create connections, which might not otherwise have been present, with some other thought; while this second thought itself may already have had its original form of expression changed, with a view to meeting the first one half-way.

Herbert Silberer (1909) has pointed out a good way of directly observing the transformation of thoughts into pictures in the process of forming dreams and so of studying this one factor of the dream-work in isolation. If, when he was in a fatigued and sleepy condition, he set himself some intellectual task, he found that it often happened that the thought escaped him and that in its place a picture appeared, which he was then able to recognize as a substitute for the thought. Silberer describes these substitutes by the not very appropriate term of 'auto-symbolic.' I will here quote a few examples from Silberer's paper, and I shall have occasion, on account of certain characteristics of the phenomena concerned, to return to them later.

'Example 1. - I thought of having to revise an uneven passage in an essay.

'Symbol. - I saw myself planing a piece of wood.'

'Example 5. - I endeavoured to bring home to myself the aim of certain metaphysical studies which I was proposing to make. Their aim, I reflected, was to work one's way through to ever higher forms of consciousness and layers of existence, in one's search for the bases of existence.

'Symbol. - I was pushing a long knife under a cake, as though to lift out a slice.

'Interpretation. - My motion with the knife meant the "working my way through" which was in question. . . . Here is the explanation of the symbolism. It is from time to time my business at meals to cut up a cake and distribute the helpings. I perform the task with a long, flexible knife - which demands some care. In particular, to lift out the slices cleanly after they have been cut offers certain difficulties; the knife must be pushed carefully *under* the slice (corresponding to the slow "working my way through" to reach the "bases"). But there is yet more symbolism in the picture. For the cake in the symbol was a "Dobos" cake - a cake with a number of "layers" through which, in cutting it, the knife has to penetrate (the "layers" of consciousness and thought).'

'Example 9. - I had lost the thread in a train of thought. I tried to find it again, but had to admit that the starting-point had completely escaped me.

'Symbol. - Part of a compositor's forme, with the last lines of type fallen away.'

In view of the part played by jokes, quotations, songs and proverbs in the mental life of educated people, it would fully agree with our expectations if disguises of such kinds were used with extreme frequency for representing dream-thoughts. What, for instance, is the meaning in a dream of a number of carts, each filled with a different sort of vegetable? They stand for a wishful contrast to '*Kraut und Rüben*', that is to say to 'higgledy-piggledy', and accordingly signify 'disorder.' I am surprised that this dream has only been reported to me once.¹ A dream-symbolism of universal validity has only emerged in the case of a few subjects, on the basis of generally familiar allusions and verbal substitutes. Moreover a good part of this symbolism is shared by dreams with psychoneuroses, legends and popular customs.

¹ [Footnote added 1925:] I have in fact never met with this image again; so I have lost confidence in the correctness of the interpretation.

Indeed, when we look into the matter more closely, we must recognize the fact that the dream-work is doing nothing original in making substitutions of this kind. In order to gain its ends - in this case the possibility of a representation hampered by censorship - it merely follows the paths which it finds already laid down in the unconscious; and it gives preference to those transformations of the repressed material which can also become conscious in the form of jokes or allusions and of which the phantasies of neurotic patients are so full. At this point we suddenly reach an understanding of Scherner's dream interpretations, whose essential correctness I have defended elsewhere. The imagination's pre-occupation with the subject's own body is by no means peculiar to dreams or characteristic only of them. My analyses have shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted, is a house the only circle of ideas employed for symbolizing the body; and this is equally true of dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far beyond the sphere of the external genitalia.) For these patients pillars and columns represent the legs (as they do in the *Song of Solomon*), every gateway stands for one of the bodily orifices (a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual images.¹ In the former case the way has been well prepared by linguistic usage, itself the precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the seed, and the maiden's garden in the *Song of Solomon*. The ugliest as well as the most intimate details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual symbolism can find its best hiding-place behind what is commonplace and inconspicuous. There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics of the natural human dread of snakes. Wherever neuroses make use of such disguises they are following paths along which all humanity passed in the earliest periods of civilization - paths of whose continued existence today, under the thinnest of veils, evidence is to be found in linguistic usages, superstitions and customs.

¹ [Footnote added 1914:] Abundant evidence of this is to be found in the three supplementary volumes to Fuchs (1909-12).

I will now append the 'flowery' dream dreamt by one of my women patients which I have already promised to record. I have indicated in small capitals those elements in it that are to be given a sexual interpretation. The dreamer quite lost her liking for this pretty dream after it had been interpreted.

(a) INTRODUCTORY DREAM: *She went into the kitchen where her two maidservants were, and found fault with them for not having got her 'bite of food' ready. At the same time she saw quite a quantity of crockery standing upside down to drain, common crockery piled up in heaps. Later addition: The two maidservants went to fetch some water and had to step into a kind of river which came right up to the house into the yard.*¹

(b) MAIN DREAM ²: *She was descending from a height³ over some strangely constructed pallisades or fences, which were put together into large panels, and consisted of small squares of wattling⁴. It was not intended for climbing over; she had trouble in finding a place to put her feet in and felt glad that her dress had not been caught anywhere, so that she had stayed respectable as she went along.*⁵ *She was holding a BIG BRANCH in her hand⁶; actually, it was like a tree, covered over with RED BLOSSOMS, branching and spreading out.*⁷ *There was an idea of their being cherry-BLOSSOMS; but they also looked like double CAMELLIAS, though of course those do not grow on trees. As she went down, first she had ONE, then suddenly TWO, and later again ONE.*⁸ *When she got down, the lower BLOSSOMS were already a good deal FADED. Then she saw, after she had got down, a manservant who - she felt inclined to say - was combing a similar tree, that is to say, he was using a similar PIECE OF WOOD to drag out some THICK TUFTS OF HAIR that were hanging down from it like moss. Some other workmen had cut down some similar BRANCHES from a GARDEN and thrown them into the ROAD, where they LAY ABOUT, so that A LOT OF PEOPLE TOOK SOME. But she asked whether that was alright - whether she might TAKE ONE TOO.*⁹ *A young MAN (someone she knew, a stranger) was standing in the garden; she went up to him to ask him how BRANCHES of that kind could be TRANSPLANTED INTO HER OWN GARDEN.*¹⁰ *He embraced her; whereupon she struggled and asked him what he was thinking of and whether he thought people could embrace her like that. He said there was no harm in that: it was allowed.*¹¹ *He then said that he was willing to go up into the OTHER GARDEN with her, to show her how the planting was done, and added something she could not quite understand: 'Anyhow, I need three YARDS (later she gave it as: three square yards) or three fathoms of ground.' It was as though he were asking her for something in return for his willingness, as though he intended to COMPENSATE HIMSELF IN HER GARDEN, or as though he wanted to CHEAT some law or other, to get some advantage from it without causing her harm. Whether he really showed her something, she had no idea.*

¹ For the interpretation of this introductory dream, which is to be interpreted as a causal dependent clause, see p. 786.

² Describing the course of her life.

³ Her high descent: a wishful antithesis to the introductory dream.

⁴ A composite picture, uniting two localities: what were known as the 'attics' of her family home, where she used to play with her brother, the object of her later phantasies, and a farm belonging to a bad uncle who used to tease her.

⁵ A wishful antithesis to a real recollection of her uncle's farm, where she used to throw off her clothes in her sleep.

⁶ Just as the angel carries a sprig of lilies in pictures of the Annunciation.

⁷ For the explanation of this composite image see p. 789: innocence, menstruation, *La dame aux camélias*.

⁸ Referring to the multiplicity of the people involved in her phantasy

⁹ That is whether she might pull one down, i. e. masturbate.

¹⁰ The branch had long since come to stand for the male genital organ; incidentally it also made a plain allusion to her family name.

¹¹ This, as well as what next follows, related to marriage precautions.

This dream, which I have brought forward on account of its symbolic elements, may be described as a 'biographical' one. Dreams of this kind occur frequently during psycho-analysis, but perhaps only rarely outside it.¹

I naturally have at my disposal a superfluity of material of this kind, but to report it would involve us too deeply in a consideration of neurotic conditions. It all leads to the same conclusion, namely that there is no necessity to assume that any peculiar symbolizing activity of the mind is operating in the dream-work, but that dreams make use of any symbolizations which are already present in unconscious thinking, because they fit in better with the requirements of dream-construction on account of their representability and also because as a rule they escape censorship.

¹ [*Footnote added 1911:*] A similar 'biographical' dream will be found below as the third of my examples of dream-symbolism. Another one has been recorded at length by Rank, and another, which must be read 'in reverse', by Stekel (1909, 486).

(E)

REPRESENTATION BY SYMBOLS IN DREAMS
- SOME FURTHER TYPICAL DREAMS

The analysis of this last, biographical, dream is clear evidence that I recognized the presence of symbolism in dreams from the very beginning. But it was only by degrees and as my experience increased that I arrived at a full appreciation of its extent and significance, and I did so under the influence of the contributions of Wilhelm Stekel (1911), about whom a few words will not be out of place here.

That writer, who has perhaps damaged psycho-analysis as much as he has benefited it, brought forward a large number of unsuspected translations of symbols; to begin with they were met with scepticism, but later they were for the most part confirmed and had to be accepted. I shall not be belittling the value of Stekel's services if I add that the sceptical reserve with which his proposals were received was not without justification. For the examples by which he supported his interpretations were often unconvincing, and he made use of a method which must be rejected as scientifically untrustworthy. Stekel arrived at his interpretations of symbols by way of intuition, thanks to a peculiar gift for the direct understanding of them. But the existence of such a gift cannot be counted upon generally, its effectiveness is exempt from all criticism and consequently its findings have no claim to credibility. It is as though one sought to base the diagnosis of infectious diseases upon olfactory impressions received at the patient's bedside - though there have undoubtedly been clinicians who could accomplish more than other people by means of the sense of smell (which is usually atrophied) and were really able to diagnose a case of enteric fever by smell.

Advances in psycho-analytic experience have brought to our notice patients who have shown a direct understanding of dream-symbolism of this kind to a surprising extent. They were often sufferers from dementia praecox, so that for a time there was an inclination to suspect every dreamer who had this grasp of symbols of being a victim of that disease. But such is not the case. It is a question of a personal gift or peculiarity which has no visible pathological significance.

When we have become familiar with the abundant use made of symbolism for representing sexual material in dreams, the question is bound to arise of whether many of these symbols do not occur with a permanently fixed meaning, like the 'grammalogues' in shorthand; and we shall feel tempted to draw up a new 'dream-book' on the decoding principle. On that point there is this to be said: this symbolism is not peculiar to dreams, but is characteristic of unconscious ideation, in particular among the people, and it is to be found in folklore, and in popular myths, legends, linguistic idioms, proverbial wisdom and current jokes, to a more complete extent than in dreams.

It would therefore carry us far beyond the sphere of dream-interpretation if we were to do justice to the significance of symbols and discuss the numerous, and to a large extent still unsolved, problems attaching to the concept of a symbol.¹ We must restrict ourselves here to remarking that representation by a symbol is among the indirect methods of representation, but that all kinds of indications warn us against lumping it in with other forms of indirect representation without being able to form any clear conceptual picture of their distinguishing features. In a number of cases the element in common between a symbol and what it represents is obvious; in others it is concealed and the choice of the symbol seems puzzling. It is precisely these latter cases which must be able to throw light upon the ultimate meaning of the symbolic relation, and they indicate that it is of a genetic character. Things that are symbolically connected to-day were probably united in prehistoric times by conceptual and linguistic identity.² The symbolic relation seems to be a relic and a mark of former identity. In this connection we may observe how in a number of cases the use of a common symbol extends further than the use of a common language, as was already pointed out by Schubert (1814).³ A number of symbols are as old as language itself, while others (e.g. 'airship', 'Zeppelin') are being coined continuously down to the present time.

¹ [Footnote added 1911:] Cf. the works of Bleuler and of his Zurich pupils, Maeder, Abraham], etc., on symbolism, and the non-medical writers to whom they refer (Kleinpaul, etc.). [Added 1914:] What is most to the point on this subject will be found in Rank and Sachs (1913, Chapter I). [Added 1925:] See further Jones (1916).

² [Footnote added 1925:] This view would be powerfully supported by a theory put forward by Dr. Hans Sperber (1912). He is of the opinion that all primal words referred to sexual things but afterwards lost their sexual meaning though being applied to other things and activities which were compared with the sexual ones.

³ [Added 1914:] For instance, according to Ferenczi, a ship moving on the water occurs in dreams of micturition in Hungarian dreamers, though the term '*schiffen*' is unknown in that language. (See also p. 829 f. below.) In dreams of speakers of French and other Romance languages a room is used to symbolize a woman, though these languages have nothing akin to the German expression '*Frauenzimmer*.'

Dreams make use of this symbolism for the disguised representation of their latent thoughts. Incidentally, many of the symbols are habitually or almost habitually employed to express the same thing. Nevertheless, the peculiar plasticity of the psychical material must never be forgotten. Often enough a symbol has to be interpreted in its proper meaning and not symbolically; while on other occasions a dreamer may derive from his private memories the power to employ as sexual symbols all kinds of things which are not ordinarily employed as such. If a dreamer has a choice open to him between a number of symbols, he will decide in favour of the one which is connected in its subject-matter with the rest of the material of his thoughts - which, that is to say, has individual grounds for its acceptance in addition to the typical ones.

Though the later investigations since the time of Scherner have made it impossible to dispute the existence of dream symbolism - even Havelock Ellis admits that there can be no doubt that our dreams are full of symbolism - yet it must be confessed that the presence of symbols in dreams not only facilitates their interpretation but also makes it more difficult. As a rule the technique of interpreting according to the dreamer's free associations leaves us in the lurch when we come to the symbolic elements in the dream-content. Regard for scientific criticism forbids our returning to the arbitrary judgement of the dream-interpreter, as it was employed in ancient times and seems to have been revived in the reckless interpretations of Stekel. We are thus obliged, in dealing with those elements of the dream-content which must be recognized as symbolic, to adopt a combined technique, which on the one hand rests on the dreamer's associations and on the other hand fills the gaps from the interpreter's knowledge of symbols. We must combine a critical caution in resolving symbols with a careful study of them in dreams which afford particularly clear instances of their use, in order to disarm any charge of arbitrariness in dream-interpretation. The uncertainties which still attach to our activities as interpreters of dreams spring in part from our incomplete knowledge, which can be progressively improved as we advance further, but in part from certain characteristics of dream-symbols themselves. They frequently have more than one or even several meanings, and, as with Chinese script, the correct interpretation can only be arrived at on each occasion from the context. This ambiguity of the symbols links up with the characteristic of dreams for admitting of 'over-interpretation' - for representing in a single piece of content thoughts and wishes which are often widely divergent in their nature.

Subject to these qualifications and reservations I will now proceed. The Emperor and Empress (or the King and Queen) as a rule really represent the dreamer's parents; and a Prince or Princess represents the dreamer himself or herself. But the same high authority is attributed to great men as to the Emperor; and for that reason Goethe, for instance, appears as a father-symbol in some dreams (Hitschmann, 1913.) - All elongated objects, such as sticks, tree-trunks and umbrellas (the opening of these last being comparable to an erection) may stand for the male organ - as well as all long, sharp weapons, such as knives, daggers and pikes. Another frequent though not entirely intelligible symbol of the same thing is a nail-file - possibly on account of the rubbing up and down. - Boxes, cases, chests, cupboards and ovens represent the uterus, and also hollow objects, ships, and vessels of all kinds. - Rooms in dreams are usually women ('*Frauenzimmer*'); if the various ways in and out of them are represented, this interpretation is scarcely open to doubt.¹ In this connection interest in whether the room is open or locked is easily intelligible. (Cf. Dora's first dream in my 'Fragment of an Analysis of a Case of Hysteria', 1905e.) There is no need to name explicitly the key that unlocks the room; in his ballad of Count Eberstein, Uhland has used the symbolism of locks and keys to construct a charming piece of bawdry. - A dream of going through a suite of rooms is a brothel or harem dream. But, as Sachs has shown by some neat examples, it can also be used (by antithesis) to represent marriage. - We find an interesting link with the sexual researches of childhood when a dreamer dreams of two rooms which were originally one, or when he sees a familiar room divided into two in the dream, or *vice versa*. In childhood the female genitals and the anus are regarded as a single area - the 'bottom' (in accordance with the infantile 'cloaca theory'); and it is not until later that the discovery is made that this region of the body comprises two separate cavities and orifices. - Steps, ladders or staircases, or, as the case may be, walking up or down them, are representations of the sexual act.² - Smooth walls over which the dreamer climbs, the façades of houses, down which he lowers himself - often in great anxiety - correspond to erect human bodies, and are probably repeating in the dream recollections of a baby's climbing up his parents or nurse. The 'smooth' walls are men; in his fear the dreamer often clutches hold of 'projections' in the façades of houses. Tables, tables laid for a meal, and boards also stand for women - no doubt by antithesis, since the contours of their bodies are eliminated in the symbols. 'Wood' seems, from its linguistic connections, to stand in general for female 'material.' The name of the Island of 'Madeira' means 'wood' in Portuguese. Since 'bed and board' constitute marriage, the latter often takes the place of the former in dreams and the sexual complex of ideas is, so far as may be, transposed on to the eating complex. - As regards articles of clothing, a woman's hat can very often be interpreted with certainty as a genital organ, and, moreover, as a *man's*. The same is true of an overcoat [German '*Mantel*'], though in this case it is not clear to what extent the use of the symbol is due to a verbal assonance. In men's dreams a necktie often appears as a symbol for the penis. No doubt this is not only because neckties are long, dependent objects and peculiar to men, but also because they can be chosen according to taste - a liberty which, in the case of the object symbolized, is forbidden by Nature.³ Men who make use of this symbol in dreams are often very extravagant in ties in real life and own whole collections of them. - It is highly probable that all complicated machinery and apparatus occurring in dreams stand for the genitals (and as a rule male ones - in describing which dream-symbolism is as indefatigable as the 'joke-work.' Nor is there any doubt that all weapons and tools are used as symbols for the male organ: e.g. ploughs, hammers, rifles, revolvers, daggers, sabres, etc. - In the same way many landscapes in dreams, especially any containing bridges or wooded hills, may clearly be recognized as descriptions of the genitals. Marcinowski has published a collection of dreams illustrated by their dreamers with drawings that ostensibly represent landscapes and other localities occurring in the dreams. These drawings bring out very clearly the distinction between a dream's manifest and latent meaning. Whereas to the innocent eye they appear as plans, maps, and so on, closer inspection shows that they represent the human body, the genitals, etc., and only then do the dreams become intelligible. (See in this connection Pfister's papers on cryptograms and puzzle-pictures.) In the case of unintelligible neologisms, too, it is worth considering whether they may not be put together from components with a sexual meaning. - Children in dreams often stand for the genitals; and, indeed, both men and women are in the habit of referring to their genitals affectionately as their 'little ones.' Stekel is right in recognizing a 'little brother' as the penis. Playing with a little child, beating it, etc., often represent masturbation in dreams. - To represent castration symbolically, the dream-work makes use of baldness, hair-cutting, falling out of teeth and decapitation. If one of the ordinary symbols for a penis occurs in a dream doubled or multiplied, it is to be regarded as a warding-off of castration. The appearance in dreams of lizards - animals whose tails grow again if they are pulled off - has the same significance. (Cf. the lizard-dream on p. 525 f.) - Many of the beasts which are used as genital symbols in mythology and folklore play the same part in dreams: e.g. fishes, snails, cats, mice (on account of the pubic hair), and above all those most important symbols of the male organ - snakes. Small animals and vermin represent small children - for instance, undesired brothers and sisters. Being plagued with vermin is often a

The Interpretation Of Dreams

sign of pregnancy. - A quite recent symbol of the male organ in dreams deserves mention: the airship, whose use in this sense is justified by its connection with flying as well as sometimes by its shape.

¹ [Footnote added 1919:] 'One of my patients, who was living in a boarding-house, dreamt that *he met one of the maidservants and asked her what her number was. To his surprise she answered: "14".* He had in fact started a *liason* with this girl and had paid several visits to her in her bedroom. She had not unnaturally been afraid that the landlady might become suspicious, and, on the day before the dream, she had proposed that they should meet in an unoccupied room. This room was actually "No. 14", while in the dream it was the woman herself who bore this number. It would hardly be possible to imagine clearer proof of an identification between a woman and a room.' (Jones, 1914a.) Cf. Artemidorus, *Oneirocritica*, Book II, Chapter X: 'Thus, for instance, a bed chamber stands for a wife, if such there be in the house.' (Trans. F. S. Krauss, 1881, 110.)

² [Footnote added 1911:] I will repeat here what I have written on this subject elsewhere (Freud, 1910d): 'A little time ago I heard that a psychologist whose views are somewhat different from ours had remarked to one of us that, when all was said and done, we did undoubtedly exaggerate the hidden sexual significance of dreams: his own commonest dream was of going upstairs, and surely there could not be anything sexual in *that*. We were put on the alert by this objection, and began to turn our attention to the appearance of steps, staircases and ladders in dreams, and were soon in a position to show that staircases (and analogous things) were unquestionably symbols of copulation. It is not hard to discover the basis of the comparison: we come to the top in a series of rhythmical movements and with increasing breathlessness and then, with a few rapid leaps, we can get to the bottom again. Thus the rhythmical pattern of copulation is reproduced in going upstairs. Nor must we omit to bring in the evidence of linguistic usage. It shows us that "mounting" [German "*steigen*"] is used as a direct equivalent for the sexual act. We speak of a man as a "*Steiger*" [a "mounter"] and of "*nachsteigen*" ["to run after", literally "to climb after"]. In French the steps on a staircase are called "*marches*" and "*un vieux marcheur*" has the same meaning as our "*ein alter Steiger*" ["an old rake"].'

³ [Footnote added 1914:] Compare the drawing made by a nineteen-year-old manic patient reproduced in *Zbl. Psychoanal*, 2, 675. It represents a man with a necktie consisting of a snake which is turning in the direction of a girl. See also the story of 'The Bashful Man' in *Anthropophyteia*, 6, 334: A lady went into a bathroom, and there she came upon a gentleman who scarcely had time to put on his shirt. He was very much embarrassed, but hurriedly covering his throat with the front part of his shirt, he exclaimed: 'Excuse me, but I've not got my necktie on.'

A number of other symbols have been put forward, with supporting instances, by Stekel, but have not yet been sufficiently verified. Stekel's writings, and in particular his *Die Sprache des Traumes* (1911), contain the fullest collection of interpretations of symbols. Many of these show penetration, and further examination has proved them correct: for instance, his section on the symbolism of death. But this author's lack of a critical faculty and his tendency to generalization at all costs throw doubts upon others of his interpretations or render them unusable; so that it is highly advisable to exercise caution in accepting his conclusions. I therefore content myself with drawing attention to only a few of his findings.

According to Stekel, 'right' and 'left' in dreams have an ethical sense. 'The right-hand path always means the path of righteousness and the left-hand one that of crime. Thus "left" may represent homosexuality, incest or perversion, and "right" may represent marriage, intercourse with a prostitute and so on, always looked at from the subject's individual moral stand point.' (Stekel, 1909, 466 ff.) - Relatives in dreams usually play the part of genitals (ibid., 473). I can only confirm this in the case of sons, daughters and younger sisters - that is only so far as they fall into the category of 'little ones.' On the other hand I have come across undoubted cases in which 'sisters' symbolized the breasts and 'brothers' the larger hemispheres. - Stekel explains failing to catch up with a carriage as regret at a difference in age which cannot be caught up with (ibid., 479). - Luggage that one travels with is a load of sin, he says, that weighs one down (loc. cit.). But precisely luggage often turns out to be an unmistakable symbol of the dreamer's own genitals. - Stekel also assigns fixed symbolic meanings to numbers, such as often appear in dreams. But these explanations seem neither sufficiently verified nor generally valid, though his interpretations usually appear plausible in the individual cases. In any case the number three has been confirmed from many sides as a symbol of the male genitals.

One of the generalizations put forward by Stekel concerns the double significance of genital symbols. 'Where', he asks, 'is there a symbol which - provided that the imagination by any means admits of it - cannot be employed both in a male and in a female sense?' In any case the clause in parenthesis removes much of the certainty from this assertion, since in fact the imagination does not always admit of it. But I think it is worth while remarking that in my experience Stekel's generalization cannot be maintained in the face of the greater complexity of the facts. In addition to symbols which can stand with equal frequency for the male and for the female genitals, there are some which designate one of the sexes predominantly or almost exclusively, and yet others which are known *only* with a male or a female meaning. For it is a fact that the imagination does not admit of long, stiff objects and weapons being used as symbols of the female genitals, or of hollow objects, such as chests, cases, boxes, etc., being used as symbols for the male ones. It is true that the tendency of dreams and of unconscious phantasies to employ sexual symbols bisexually betrays an archaic characteristic; for in childhood the distinction between the genitals of the two sexes is unknown and the same kind of genitals are attributed to both of them. But it is possible, too, to be misled into wrongly supposing that a sexual symbol is bisexual, if one forgets that in some dreams there is a general inversion of sex, so that what is male is represented as female and *vice versa*. Dreams of this kind may, for instance, express a woman's wish to be a man.

The genitals can also be represented in dreams by other parts of the body: the male organ by a hand or a foot and the female genital orifice by the mouth or an ear or even an eye. The secretions of the human body - mucus, tears, urine, semen, etc. - can replace one another in dreams. This last assertion of Stekel's, which is on the whole correct, has been justifiably criticized by Reitler (1913*b*) as requiring some qualification: what in fact happens is that significant secretions, such as semen, are replaced by indifferent ones.

It is to be hoped that these very incomplete hints may serve to encourage others to undertake a more painstaking general study of the subject.¹ I myself have attempted to give a more elaborate account of dream-symbolism in my *Introductory Lectures on Psycho-Analysis* (1916-17).

I shall now append a few examples of the use of these symbols in dreams, with the idea of showing how impossible it becomes to arrive at the interpretation of a dream if one excludes dream-symbolism, and how irresistibly one is driven to accept it in many cases. At the same time, however, I should like to utter an express warning against over-estimating the importance of symbols in dream-interpretation, against restricting the work of translating dreams merely to translating symbols and against abandoning the technique of making use of the dreamer's associations. The two techniques of dream-interpretation must be complementary to each other; but both in practice and in theory the first place continues to be held by the procedure which I began by describing and which attributes a decisive significance to the comments made by the dreamer, while the translation of symbols, as I have explained it, is also at our disposal as an auxiliary method.

¹ [*Footnote added 1911:*] However much Scherner's view of dream-symbolism may differ from the one developed in these pages, I must insist that he is to be regarded as the true discoverer of symbolism in dreams, and that the investigations of psycho-analysis have at last brought recognition to his book, published as it was so many years ago (in 1861), and for so long regarded as fantastic.

I

A HAT AS A SYMBOL OF A MAN (OR OF MALE GENITALS)

(Extract from the dream of a young woman suffering from agoraphobia as a result of fears of seduction.)

'I was walking in the street in the summer, wearing a straw hat of peculiar shape; its middle-piece was bent upwards and its side-pieces hung downwards' (the description became hesitant at this point) 'in such a way that one side was lower than the other. I was cheerful and in a self-confident frame of mind; and, as I passed a group of young officers, I thought: "None of you can do me any harm!"'

Since nothing occurred to her in connection with the hat in the dream, I said: 'No doubt the hat was a male genital organ, with its middle-piece sticking up and its two side-pieces hanging down. It may seem strange, perhaps, that a hat should be a man, but you will remember the phrase "*Unter die Haube kommen*" ["to find a husband" (literally "to come under the cap")].' I intentionally gave her no interpretation of the detail about the two side-pieces hanging down unevenly; though it is precisely details of this kind that must point the way in determining an interpretation. I went on to say that as she had a husband with such fine genitals there was no need for her to be afraid of the officers - no need, that is, for her to wish for anything from them, since as a rule she was prevented from going for a walk unprotected and unaccompanied owing to her phantasies of being seduced. I had already been able to give her this last explanation of her anxiety on several occasions upon the basis of other material.

The way in which the dreamer reacted to this material was most remarkable. She withdrew her description of the hat and maintained that she had never said that the two side-pieces hung down. I was too certain of what I had heard to be led astray, and stuck to my guns. She was silent for a while and then found enough courage to ask what was meant by one of her husband's testes hanging down lower than the other and whether it was the same in all men. In this way the remarkable detail of the hat was explained and the interpretation accepted by her.

At the time my patient told me this dream I had long been familiar with the hat-symbol. Other, less transparent cases had led me to suppose that a hat can also stand for female genitals.¹

¹ [Footnote added 1911:] Cf. an example of this in Kirchgraber (1912). Stekel (1909, 475) records a dream in which a hat with a feather standing up crooked in the middle of it symbolized an (impotent) man.

II

A 'LITTLE ONE' AS THE GENITAL ORGAN -
'BEING RUN OVER' AS A SYMBOL OF SEXUAL INTERCOURSE

(Another dream of the same agoraphobic patient.)

Her mother sent her little daughter away, so that she had to go by herself. Then she went in a train with her mother and saw her little one walk straight on to the rails so that she was bound to be run over. She heard the cracking of her bones. (This produced an uncomfortable feeling in her but no real horror.) Then she looked round out of the window of the railway-carriage to see whether the parts could no be seen behind. Then she reproached her mother for having made the little one go by herself.

ANALYSIS. - It is no easy matter to give a complete interpretation of the dream. It formed part of a cycle of dreams and can only be fully understood if it is taken in connection with the others. There is difficulty in obtaining in sufficient isolation the material necessary for establishing the symbolism. - In the first place, the patient declared that the train journey was to be interpreted historically, as an allusion to a journey she had taken when she was leaving a sanatorium for nervous diseases, with whose director, needless to say, she had been in love. Her mother had fetched her away, and the doctor had appeared at the station and handed her a bouquet of flowers as a parting present. It had been very awkward that her mother should have witnessed this tribute. At this point, then, her mother figured as interfering with her attempts at a love affair; and this had in fact been the part played by that severe lady during the patient's girlhood. - Her next association related to the sentence: 'she looked round to see whether the parts could not be seen from behind.' The façade of the dream would of course lead one to think of the parts of her little daughter who had been run over and mangled. But her association led in quite another direction. She recollected having once seen her father naked in the bath room from behind; she went on to talk of the distinctions between the sexes, and laid stress on the fact that a man's genitals can be seen even from behind but a woman's cannot. In this connection she herself interpreted 'the little one' as meaning the genitals and 'her little one' - she had a four-year-old daughter - as her own genitals. She reproached her mother with having expected her to live as though she had no genitals, and pointed out that the same reproach was expressed in the opening sentence of the dream: 'her mother sent her little one away, so that she had to go by herself.' In her imagination 'going by herself in the streets' meant not having a man, not having any sexual relations ('coire' in Latin means literally 'to go with') - and she disliked that. Her accounts all went to show that when she was a girl she had in fact suffered from her mother's jealousy owing to the preference shown her by her father.

The deeper interpretation of this dream was shown by another dream of the same night, in which the dreamer identified herself with her brother. She had actually been a boyish girl, and had often been told that she should have been a boy. This identification with her brother made it particularly clear that 'the little one' meant a genital organ. Her mother was threatening him (or her) with castration, which could only have been a punishment for playing with her penis; thus the identification also proved that she herself had masturbated as a child - a memory which till then she had only had as applied to her brother. The information supplied by the second dream showed that she must have come to know about the male organ at an early age and have afterwards forgotten it. Further, the second dream alluded to the infantile sexual theory according to which girls are boys who have been castrated. When I suggested to her that she had had this childish belief, she at once confirmed the fact by telling me that she had heard the anecdote of the little boy's saying to the little girl: 'Cut off?' and of the little girl's replying: 'No, always been like that.'

Thus the sending away of the little one (of the genital organ) in the first dream was also related to the threat of castration. Her ultimate complaint against her mother was for not having given birth to her as a boy.

The fact that 'being run over' symbolizes sexual intercourse would not be obvious from this dream, though it has been confirmed from many other sources.

III

THE GENITALS REPRESENTED BY BUILDINGS, STAIRS AND SHAFTS

He was going for a walk with his father in a place which must certainly have been the Prater, since he saw the ROTUNDA, with a SMALL ANNEX IN FRONT OF IT to which A CAPTIVE BALLOON was attached, though it looked rather LIMP. His father asked him what all this was for; he was surprised at his asking, but explained it to him. Then they came into a courtyard which had a large sheet laid out in it. His father wanted to PULL OFF a large piece of it, but first looked around to see if anyone was watching. He told him that he need only tell the foreman and he could take some without any bother. A STAIRCASE led down from this yard into A SHAFT, whose walls were cushioned in some soft material, rather like a leather armchair. A the end of the shaft was a longish platform and then another SHAFT started . . .

ANALYSIS. -This dreamer belonged to a type whose therapeutic prospects are not favourable: up to a certain point they offer no resistance at all to analysis, but from then onwards turn out to be almost inaccessible. He interpreted this dream almost unaided. 'The Rotunda', he said, 'was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was, that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. Since he had in fact never questioned his father in this way, we had to look upon the dream-thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment. . .' We shall presently find the continuation of this thought in another part of the dream.

The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream-thought I have just interpreted may have continued in this way: '(If I had asked him), he would have deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation - namely that it stood for masturbating. Not only was I already familiar with this interpretation (see p. 817 n. above), but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added from my own knowledge derived elsewhere that climbing down, like climbing up in other cases, described sexual intercourse in the vagina. (See my remarks, quoted above, p. 821 n.)

The dreamer himself gave a biographical explanation of the fact that the first shaft was followed by a longish platform and then by another shaft. He had practised intercourse for a time but had then given it up on account of inhibitions, and he now hoped to be able to resume it by the help of the treatment. The dream became more indistinct, however, towards the end, and it must seem probable to anyone who is familiar with these things that the influence of another topic was already making itself felt in the second scene of the dream, and was hinted at by the father's business, by his deceitful conduct and by the interpretation of the first shaft as a vagina: all this pointed to a connection with the dreamer's mother.

IV

THE MALE ORGAN REPRESENTED BY PERSONS AND THE
FEMALE ORGAN BY A LANDSCAPE

(The dream of an uneducated woman whose husband was a policeman, reported by B. Dattner.)
' . . . Then someone broke into the house and she was frightened and called out for a policeman. But he had quietly gone into a church ¹, to which a number of steps ² led up, accompanied by two tramps. Behind the church there was a hill ³ and above it a thick wood.⁴ The policeman was dressed in a helmet, brass collar and cloak.⁵ He had a brown beard. The two tramps, who went along peaceably with the policeman, had sack-like aprons tied around their middles.⁶ In front of the church a path led up to the hill; on both sides of it there grew grass and brushwood, which became thicker and thicker and, at the top of the hill, turned into a regular wood.'

V

DREAMS OF CASTRATION IN CHILDREN

(a) A boy aged three years and five months, who obviously disliked the idea of his father's returning from the front, woke up one morning in a disturbed and excited state. He kept on repeating: '*Why was Daddy carrying his head on a plate? Last night Daddy was carrying his head on a plate.*'

(b) A student who is now suffering from a severe obsessional neurosis remembers having repeatedly had the following dream during his sixth year: *He went to the hairdresser's to have his hair cut. A big, severe-looking woman came up to him and cut his head off. He recognized the woman as his mother.*

¹ 'Or chapel (= vagina).'

² 'Symbol of copulation.'

³ '*Mons veneris.*'

⁴ 'Pubic hair.'

⁵ 'According to an expert, demons in cloaks and hoods are of a phallic character.'

⁶ 'The two halves of the scrotum.'

VI

URINARY SYMBOLISM

The series of drawings were found by Ferenczi in a Hungarian comic paper called *Fidibusz*, and he at once saw how well they could be used to illustrate the theory of dreams. Otto Rank has already reproduced them in a paper (1912a).

The drawings bear the title 'A French Nurse's Dream'; but it is only the last picture, showing the nurse being woken up by the child's screams, that tells us that the seven previous pictures represent the phases of a dream. The first picture depicts the stimulus which should have caused the sleeper to wake: the little boy has become aware of a need and is asking for help in dealing with it. But in the dream the dreamer, instead of being in the bedroom, is taking the child for a walk. In the second picture she has already led him to a street corner where he is micturating - and she can go on sleeping. But the arousal stimulus continues; indeed, it increases. The little boy, finding he is not being attended to, screams louder and louder. The more imperiously he insists upon his nurse waking up and helping him, the more insistent becomes the dream's assurance that everything is all right and that there is no need for her to wake up. At the same time, the dream translates the increasing stimulus into the increasing dimensions of its symbols. The stream of water produced by the micturating boy becomes mightier and mightier. In the fourth picture it is already large enough to float a rowing boat; but there follow a gondola, a sailing-ship and finally a liner. The ingenious artist has in this way cleverly depicted the struggle between an obstinate craving for sleep and an inexhaustible stimulus towards waking.

VII

A STAIRCASE DREAM

(Reported and Interpreted by Otto Rank.)

'I have to thank a colleague to whom I owe the dream with a dental-stimulus for an equally transparent emission dream:

"I was running down the staircase in pursuit of a little girl who had done something to me, in order to punish her. At the foot of the stairs someone (a grown-up woman?) stopped the child for me. I caught hold of her; but I don't know whether I hit her, for I suddenly found myself in the middle of the staircase copulating with the child (as it were in the air). It was not a real copulation; I was only rubbing my genitals against her external genitals, and while I did so I saw them extremely distinctly, as well as her head, which was turned upwards and sideways. During the sexual act I saw hanging above me to my left (also as it were in the air) two small paintings - landscapes representing a house surrounded by trees. At the bottom of the smaller of these, instead of the painter's signature, I saw my own first name, as though it were intended as a birthday-present for me. Then I saw a label in front of the two pictures, which said that the cheaper pictures were also to be had. (I then saw myself very indistinctly as though I were lying in bed on the landing) and I was woken up by the feeling of wetness caused by the emission I had had."

'INTERPRETATION. -On the evening of the dream-day the dreamer had been in a book-shop, and as he was waiting to be attended to he had looked at some pictures which were on view there and which represented subjects similar to those in the dream. He went up close to one small picture which had particularly pleased him, to look at the artist's name - but it had been quite unknown to him.

'Later the same evening, when he was with some friends, he had heard a story of a Bohemian servant-girl who boasted that her illegitimate child had been "made on the stairs." The dreamer had enquired the details of this rather unusual event and had learnt that the servant-girl had gone home with her admirer to her parents' house, where there had been no opportunity for sexual intercourse, and in his excitement the man had copulated with her on the stairs. The dreamer had made a joking allusion to a malicious expression used to describe adulterated wines, and had said that in fact the child came of a "cellar-stair vintage".

'So much for the connections with the previous day, which appeared with some insistence in the dream-content and were reproduced by the dreamer without any difficulty. But he brought up no less easily an old fragment of infantile recollection which had also found its use in the dream. The staircase belonged to the house where he had spent the greater part of his childhood and, in particular, where he had first made conscious acquaintance with the problems of sex. He had frequently played on this staircase and, among other things, used to slide down the banisters, riding astride on them - which had given him sexual feelings. In the dream, too, he rushed down the stairs extraordinarily fast - so fast, indeed, that, according to his own specific account, he did not put his feet down on the separate steps but "flew" down them, as people say. If the infantile experience is taken into account, the beginning part of the dream seems to represent the factor of sexual excitement. - But the dreamer had also often romped in a sexual way with the neighbours' children on this same staircase and in the adjacent building, and had satisfied his desires in just the same way as he did in the dream.

'If we bear in mind that Freud's researches into sexual symbolism (1910d) have shown that stairs and going upstairs in dreams almost invariably stand for copulation, the dream becomes quite transparent. Its motive force, as indeed was shown by its outcome - an emission - was of a purely libidinal nature. The dreamer's sexual excitement was awakened during his sleep - this being represented in the dream by his rushing down the stairs. The sadistic element in the sexual excitement, based on the romping in childhood, was indicated by the pursuit and overpowering of the child. The libidinal excitement increased and pressed towards sexual action - represented in the dream by his catching hold of the child and conveying it to the middle of the staircase. Up to that point the dream was only *symbolically* sexual and would have been quite unintelligible to any inexperienced dream-interpreter. But symbolic satisfaction of that kind was not enough to guarantee a restful sleep, in view of the strength of the libidinal excitation. The excitation led to an orgasm and thus revealed the fact that the whole staircase-symbolism represented copulation. -The present dream offers a specially clear confirmation of Freud's view that one of the reasons for the use of going upstairs as a sexual symbol is the rhythmical character of both activities: for the dreamer expressly stated that the most clearly defined element in the whole dream was the rhythm of the sexual act and its up and down motion.

'I must add a word with regard to the two pictures which, apart from their real meaning, also figured in a symbolic sense as "*Weibsbilder*". This was shown at once by there being a large picture and a small picture, just as a large (or grown-up) girl and a small one appeared in the dream. The fact that "cheaper pictures were also to be had" led to the prostitute complex; while on the other hand the appearance of the dreamer's first name on the small picture and the idea of its being intended as a birthday present for him were hints at the parental complex. ("Born on the stairs" = "begotten by copulation".)

'The indistinct final scene, in which the dreamer saw himself lying in bed on the landing and had a feeling of wetness, seems to have pointed the way beyond infantile masturbation still further back into childhood and to have had its prototype in similarly pleasurable scenes of bed-wetting.'

VIII

A MODIFIED STAIRCASE DREAM

One of my patients, a man whose sexual abstinence was imposed on him by a severe neurosis, and whose phantasies were fixed upon his mother, had repeated dreams of going upstairs in her company. I once remarked to him that a moderate amount of masturbation would probably do him less harm than his compulsive self-restraint, and this provoked the following dream:

His piano-teacher reproached him for neglecting his piano-playing, and for not practising Mocheles' 'Etudes' and Clementi's 'Gradus ad Parnassum.'

By way of comment, he pointed out that 'Gradus' are also 'steps'; and that the key-board itself is a staircase, since it contains scales.

It is fair to say that there is no group of ideas that is incapable of representing sexual facts and wishes.

IX

THE FEELING OF REALITY AND THE REPRESENTATION OF REPETITION

A man who is now thirty-five years old reported a dream which he remembered clearly and claimed to have had at the age of four. *The lawyer who had charge of his father's will* - he had lost his father when he was three - *brought two large pears. He was given one of them to eat; the other lay on the window-sill in the sitting-room.* He awoke with a conviction of the reality of what he had dreamt and kept obstinately asking his mother for the second pear, and insisted that it was on the window-sill. His mother had laughed at this.

ANALYSIS. -The lawyer was a jovial old gentleman who, the dreamer seemed to remember, had really once brought some pears along. The window-sill was as he had seen it in the dream. Nothing else occurred to him in connection with it - only that his mother had told him a dream shortly before. She had had two birds sitting on her head and had asked herself when they would fly away; they did not fly away, but one of them flew to her mouth and sucked at it.

The failure of the dreamer's associations gave us a right to attempt an interpretation by symbolic substitution. The two pears - *'pommes ou poires'* - were his mother's breasts which had given him nourishment; the window-sill was the projection formed by her bosom - like balconies in dreams of houses (see p. 821). His feeling of reality after waking was justified, for his mother had really suckled him, and had done so, in fact, for far longer than the usual time and his mother's breast was still available to him. The dream must be translated: 'Give (or show) me your breast again, Mother, that I used to drink from in the past.' 'In the past' was represented by his eating one of the pears; 'again' was represented by his longing for the other. The *temporal repetition* of an act is regularly shown in dreams by the *numerical multiplication* of an object.

It is most remarkable, of course, that symbolism should already be playing a part in the dream of a four-year-old child. But this is the rule and not the exception. It may safely be asserted that dreamers have symbolism at their disposal from the very first.

The following uninfluenced recollection by a lady who is now twenty-seven shows at what an early age symbolism is employed outside dream-life as well as inside it. *She was between three and four years old. Her nurse-maid took her to the lavatory along with a brother eleven months her junior and a girl cousin of an age between the other two, to do their small business before going out for a walk. Being the eldest, she sat on the seat, while the other two sat on chambers. She asked her cousin: 'Have you got a purse too? Walter's got a little sausage; I've got a purse.'* Her cousin replied: 'Yes, I've got a purse too.' *The nurse-maid heard what they said with much amusement and reported the conversation to the children's mother, who reacted with a sharp reprimand.*

I will here interpolate a dream (recorded in a paper by Alfred Robitsek, 1912) in which the beautifully chosen symbolism made an interpretation possible with only slight assistance from the dreamer.

X

‘THE QUESTION OF SYMBOLISM IN THE DREAMS OF NORMAL PERSONS’

‘One objection which is frequently brought forward by opponents of psycho-analysis, and which has lately been voiced by Havelock Ellis (1911, 168), argues that though dream-symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psycho-analytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream-distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.

"I arrange the centre of a table with flowers for a birthday." In reply to a question she told me that in the dream she seemed to be in her own home (where she was not at present living) and had "a feeling of happiness."

"Popular" symbolism made it possible for me to translate the dream unaided. It was an expression of her bridal wishes: the table with its floral centre-piece symbolized herself and her genitals; she represented her wishes for the future as fulfilled, for her thoughts were already occupied with the birth of a baby; so her marriage lay a long way behind her.

I pointed out to her that *"the 'centre' of a table"* was an unusual expression (which she admitted), but I could not of course question her further directly on that point. I carefully avoided suggesting the meaning of the symbols to her, and merely asked her what came into her head in connection with the separate parts of the dream. In the course of the analysis her reserve gave place to an evident interest in the interpretation and to an openness made possible by the seriousness of the conversation.

‘When I asked what flowers they had been, her first reply was: *"expensive flowers; one has to pay for them,"* and then that they had been *"lilies of the valley, violets and pinks or carnations."* I assumed that the word "lily" appeared in the dream in its popular sense as a symbol of chastity; she confirmed this assumption, for her association to "lily" was *"purity"*. "Valley" is a frequent female symbol in dreams; so that the chance combination of the two symbols in the English name of the flower was used in the dream-symbolism to stress the preciousness of her virginity - *"expensive flowers, one has to pay for them"* - and to express her expectation that her husband would know how to appreciate its value. The phrase *"expensive flowers, etc."*, as will be seen, had a different meaning in the case of each of the three flower-symbols.

"*Violets*" was ostensibly quite asexual; but, very boldly, as it seemed to me, I thought I could trace a secret meaning for the word in an unconscious link with the French word "*viol*" ["rape"]. To my surprise the dreamer gave as an association the English word "*violate*". The dream had made use of the great chance similarity between the words "*violet*" and "*violate*" - the difference in their pronunciation lies merely in the different stress upon their final syllables - in order to express "in the language of flowers" the dreamer's thoughts on the violence of defloration (another term that employs flower symbolism) and possibly also a masochistic trait in her character. A pretty instance of the "verbal bridges" crossed by the paths leading to the unconscious. The words "*one has to pay for them*" signified having to pay with her life for being a wife and a mother.

'In connection with "*pinks*", which she went on to call "*carnations*", I thought of the connection between that word and "carnal." But the dreamer's association to it was "*colour*". She added that "*carnations*" were the flowers which her *fiancé* gave her frequently and in great numbers. At the end of her remarks she suddenly confessed of her own accord that she had not told the truth: what had occurred to her had not been "*colour*" but "*incarnation*" - the word I had expected. Incidentally "*colour*" itself was not a very remote association, but was determined by the meaning of "*carnation*" (flesh-colour) - was determined, that is, by the same complex. This lack of straightforwardness showed that it was at this point that resistance was greatest, and corresponded to the fact that this was where the symbolism was most clear and that the struggle between libido and its repression was at its most intense in relation to this phallic theme. The dreamer's comment to the effect that her *fiancé* frequently gave her flowers of that kind was an indication not only of the double sense of the word: "*carnation*" but also of their phallic meaning in the dream. The gift of flowers, an exciting factor of the dream derived from her current life, was used to express an exchange of sexual gifts: she was making a gift of her virginity and expected a full emotional and sexual life in return for it. At this point, too, the words "*expensive flowers, one has to pay for them*" must have had what was no doubt literally a financial meaning. -Thus the flower symbolism in this dream included virginal femininity, masculinity and an allusion to defloration by violence. It is worth pointing out in this connection that sexual flower symbolism, which, indeed, occurs very commonly in other connections, symbolizes the human organs of sex by blossoms, which are the sexual organs of plants. It may perhaps be true in general that gifts of flowers between lovers have this unconscious meaning.

'The birthday for which she was preparing in the dream meant, no doubt, the birth of a baby. She was identifying herself with her *fiancé*, and was representing him as "arranging" her for a birth - that is, as copulating with her. The latent thought may have run: "If I were he, I wouldn't wait - I would deflower my *fianceé* without asking her leave - I would use violence." This was indicated by the word "*violate*", and in this way the sadistic component of the libido found expression.

'In a deeper layer of the dream, the phrase "*I arrange . . .*" must no doubt have an auto-erotic, that is to say, an infantile, significance.

'The dreamer also revealed an awareness, which was only possible to her in a dream, of her physical deficiency: she saw herself like a table, without projections, and on that account laid all the more emphasis on the preciousness of the "*centre*" - on another occasion she used the words, "*a centre-piece of flowers*" - that is to say, on her virginity. The horizontal attribute of a table must also have contributed something to the symbol.

'The concentration of the dream should be observed: there was nothing superfluous in it, every word was a symbol.

'Later on the dreamer produced an addendum to the dream: "*I decorate the flowers with green crinkled paper*". She added that it was "*fancy paper*" of the sort used for covering common flower pots. She went on: "*to hide untidy things, whatever was to be seen, which was not pretty to the eye; there is a gap, a little space in the flowers. The paper looks like velvet or moss.*" - To "*decorate*" she gave the association "*decorum*", as I had expected. She said the green colour predominated, and her association to it was "*hope*" - another link with pregnancy. -In this part of the dream the chief factor was not identification with a man; ideas of shame and self-revelation came to the fore. She was making herself beautiful for him and was admitting physical defects which she felt ashamed of and was trying to correct. Her associations "*velvet*" and "*moss*" were a clear indication of a reference to pubic hair.

‘This dream, then, gave expression to thoughts of which the girl was scarcely aware in her waking life - thoughts concerned with sensual love and its organs. She was being "arranged for a birthday" - that is, she was being copulated with. The fear of being deflowered was finding expression, and perhaps, too, ideas of pleasurable suffering. She admitted her physical deficiencies to herself and overcompensated for them by an over-valuation of her virginity. Her shame put forward as an excuse for the signs of sensuality the fact that its purpose was the production of a baby. Material considerations, too, alien to a lover's mind, found their way to expression. The affect attaching to this simple dream - a feeling of happiness - indicated that powerful emotional complexes had found satisfaction in it.’

Ferenczi (1917) has justly pointed out that the meaning of symbols and the significance of dreams can be arrived at with particular ease from the dreams of precisely those people who are uninitiated into psycho-analysis.

At this point I shall interpose a dream dreamt by a contemporary historical figure. I am doing so because in it an object that would in any case appropriately represent a male organ has a further attribute which established it in the clearest fashion as a phallic symbol. The fact of a riding whip growing to an endless length could scarcely be taken to mean anything but an erection. Apart from this, too, the dream is an excellent instance of the way in which thoughts of a serious kind, far removed from anything sexual, can come to be represented by infantile sexual material.

XI

A DREAM OF BISMARCK'S¹

'In his *Gedanken und Erinnerungen* Bismarck quotes a letter written by him to the Emperor William I on December 18th 1881, in the course of which the following passage occurs: "Your Majesty's communication encourages me to relate a dream which I had in the Spring of 1863, in the hardest days of the Conflict, from which no human eye could see any possible way out. I dreamt (as I related the first thing next morning to my wife and other witnesses) that I was riding on a narrow Alpine path, precipice on the right, rocks on the left. The path grew narrower, so that the horse refused to proceed, and it was impossible to turn round or dismount, owing to lack of space. Then, with my whip in my left hand, I struck the smooth rock and called on God. The whip grew to an endless length, the rocky wall dropped like a piece of stage scenery and opened out a broad path, with a view over hills and forests, like a landscape in Bohemia; there were Prussian troops with banners, and even in my dream the thought came to me at once that I must report it to your Majesty. This dream was fulfilled, and I woke up rejoiced and strengthened. . . ."

'The action of this dream falls into two sections. In the first part the dreamer found himself in an *impasse* from which he was miraculously rescued in the second part. The difficult situation in which the horse and its rider were placed is an easily recognizable dream-picture of the statesman's critical position, which he may have felt with particular bitterness as he thought over the problems of his policy on the evening before the dream. In the passage quoted above Bismarck himself uses the same simile in describing the hopelessness of his position at the time. The meaning of the dream picture must therefore have been quite obvious to him. We are at the same time presented with a fine example of Silberer's "functional phenomenon". The process taking place in the dreamer's mind - each of the solutions attempted by his thoughts being met in turn by insuperable obstacles, while nevertheless he could not and might not tear himself free from the consideration of those problems - were most appropriately depicted by the rider who could neither advance nor retreat. His pride, which forbade his thinking of surrendering or resigning, was expressed in the dream by the words "it was impossible to turn round or dismount." In his quality of a man of action who exerted himself unceasingly and toiled for the good of others, Bismarck must have found it easy to liken himself to a horse; and in fact he did so on many occasions, for instance, in his well-known saying: "A good horse dies in harness." In this sense the words "the horse refused to proceed" meant nothing more nor less than that the over-tired statesman felt a need to turn away from the cares of the immediate present, or, to put it another way, that he was in the act of freeing himself from the bonds of the reality principle by sleeping and dreaming. The wish-fulfilment, which became so prominent in the second part of the dream, was already hinted at in the words "Alpine path." No doubt Bismarck already knew at that time that he was going to spend his next vacation in the Alps - at Gastein; thus the dream, by conveying him thither, set him free at one blow from all the burdens of State business.

¹ From a paper by Hanns Sachs.

'In the second part of the dream, the dreamer's wishes were represented as fulfilled in two ways: undisguisedly and obviously, and, in addition, symbolically. Their fulfilment was represented symbolically by the disappearance of the obstructive rock and the appearance in its place of a broad path - the "way out", which he was in search of, in its most convenient form; and, it was represented undisguisedly in the picture of the advancing Prussian troops. In order to explain this prophetic vision there is no need whatever for constructing mystical hypotheses; Freud's theory of wish-fulfilment fully suffices. Already at the time of this dream Bismarck desired a victorious war against Austria as the best escape from Prussia's internal conflicts. Thus the dream was representing this wish as fulfilled, just as is postulated by Freud, when the dreamer saw the Prussian troops with their banners in Bohemia, that is, in enemy country. The only peculiarity of the case was that the dreamer with whom we are here concerned was not content with the fulfilment of his wish in a *dream* but knew how to achieve it in *reality*. One feature which cannot fail to strike anyone familiar with the psycho-analytic technique of interpretation is the riding whip - which grew to an "endless length." Whips, sticks, lances and similar objects are familiar to us as phallic symbols; but when a whip further possesses the most striking characteristic of a phallus, its extensibility, scarcely a doubt can remain. The exaggeration of the phenomenon, its growing to an "endless length," seems to hint at a hypercathexis from infantile sources. The fact that the dreamer took the whip in his hand was a clear allusion to masturbation, though the reference was not, of course, to the dreamer's contemporary circumstances but to childish desires in the remote past. The interpretation discovered by Dr. Stekel that in dreams "left" stands for what is wrong, forbidden and sinful is much to the point here, for it might very well be applied to masturbation carried out in childhood in the face of prohibition. Between this deepest infantile stratum and the most superficial one, which was concerned with the statesman's immediate plans, it is possible to detect an intermediate layer which was related to both the others. The whole episode of a miraculous liberation from need by striking a rock and at the same time calling on God as a helper bears a remarkable resemblance to the Biblical scene in which Moses struck water from a rock for the thirsting Children of Israel. We may unhesitatingly assume that this passage was familiar in all its details to Bismarck, who came of a Bible-loving Protestant family. It would not be unlikely that in this time of conflict Bismarck should compare himself with Moses, the leader, whom the people he sought to free rewarded with rebellion, hatred and ingratitude. Here, then, we should have the connection with the dreamer's contemporary wishes. But on the other hand the Bible passage contains some details which apply well to a masturbation phantasy. Moses seized the rod in the face of God's command and the Lord punished him for this transgression by telling him that he must die without entering the Promised Land. The prohibited seizing of the rod (in the dream an unmistakably phallic one), the production of fluid from its blow, the threat of death - in these we find all the principal factors of infantile masturbation united. We may observe with interest the process of revision which has welded together these two heterogeneous pictures (originating, the one from the mind of a statesman of genius, and the other from the impulse: of the primitive mind of a child) and which has by that means succeeded in eliminating all the distressing factors. The fact that seizing the rod was a forbidden and rebellious act was no longer indicated except symbolically by the "left" hand which performed it. On the other hand, God was called on in the manifest content of the dream as though to deny as ostentatiously as possible any thought of a prohibition or secret. Of the two prophecies made by God to Moses - that he should see the Promised Land but that he should not enter it - the first is clearly represented as fulfilled ("the view over hills and forests"), while the second, highly distressing one was not mentioned at all. The water was probably sacrificed to the requirements of secondary revision, which successfully endeavoured to make this scene and the former one into a single unity; instead of water, the rock itself fell.

'We should expect that at the end of an infantile masturbation phantasy, which included the theme of prohibition, the child would wish that the people in authority in his environment should learn nothing of what had happened. In the dream this wish was represented by its opposite, a wish to report to the King immediately what had happened. But this reversal fitted in excellently and quite unobtrusively into the phantasy of victory contained in the superficial layer of dream-thoughts and in a portion of the manifest content of the dream. A dream such as this of victory and conquest is often a cover for a wish to succeed in an *erotic* conquest; certain features of the dream, such as, for instance, that an obstacle was set in the way of the dreamer's advance but that after he had made use of the extensible whip a broad path opened out, might point in that direction, but they afford an insufficient basis for inferring that a definite trend of thoughts and wishes of that kind ran through the dream. We have here a perfect example of completely successful dream-distortion. Whatever was obnoxious in it was worked over so that it never emerged through the surface layer that was spread over it as a protective covering. In consequence of this it was possible to avoid any release of anxiety. The dream was an ideal case of a wish successfully fulfilled without infringing the censorship; so that we may well believe that the dreamer awoke from it "rejoiced and strengthened".'

As a last example here is

XII

A CHEMIST'S DREAM

This was dreamt by a young man who was endeavouring to give up his habit of masturbating in favour of sexual relations with women.

PREAMBLE. - On the day before he had the dream he had been instructing a student on the subject of Grignard's reaction, in which magnesium is dissolved in absolutely pure ether through the catalytic action of iodine. Two days earlier, when the same reaction was being carried out, an explosion had occurred which had burnt the hand of one of the workers.

DREAM. - (I) *He was supposed to be making phenyl-magnesium-bromide. He saw the apparatus with particular distinctness, but had substituted himself for the magnesium. He now found himself in a singularly unstable state. He kept on saying to himself: 'This is all right, things are working, my feet are beginning to dissolve already, my knees are getting soft.' Then he put out his hands and felt his feet. Meanwhile (how, he could not tell) he pulled his legs out of the vessel and said to himself once more: 'This can't be right. Yes it is, though.' At this point he partly woke up and went through the dream to himself, so as to be able to report it to me. He was positively frightened of the solution) of the dream. He felt very much excited during this period of semi-sleep and kept repeating: 'Phenyl, phenyl.'*

(II) *He was at -----ing with his whole family and was due to be at the Schottentor at half-past eleven to meet a particular lady. But he only woke at half-past eleven, and said to himself: 'It's too late. You can't get there before half-past twelve.' The next moment he saw the whole family sitting round the table; he saw his mother particularly clearly and the maidservant carrying the sour-tureen. So he thought: 'Well, as we've started dinner, it's too late for me to go out.'*

ANALYSIS. - He had no doubt that even the first part of the dream had some connection with the lady whom he was to meet. (He had had the dream during the night before the expected *rendez-vous*.) He thought the student to whom he had given the instructions a particularly unpleasant person. He had said to him: 'That's not right', because the magnesium showed no signs of being affected. And the student had replied, as though he were quite unconcerned: 'No, nor it is.' The student must have stood for himself (the patient), who was just as indifferent about the analysis as the student was about the synthesis. The 'he' in the dream who carried out the operation stood for me. How unpleasant I must think him for being so indifferent about the result!

On the other hand, he (the patient) was the material which was being used for the analysis (or synthesis). What was in question was the success of the treatment. The reference to his legs in the dream reminded him of an experience of the previous evening. He had been having a dancing-lesson and had met a lady of whom he had been eager to make a conquest. He clasped her to himself so tightly that on one occasion she gave a scream. As he relaxed his pressure against her legs, he felt her strong responsive pressure against the lower part of his thighs as far down as his knees - the point mentioned in his dream. So that in this connection it was the woman who was the magnesium in the retort - things were working at last. He was feminine in relation to me, just as he was masculine in relation to the woman. If it was working with the lady it was working with him in the treatment. His feeling himself and the sensations in his knees pointed to masturbation and fitted in with his fatigue on the previous day. -His appointment with the lady had in fact been for half-past eleven. His wish to miss it by oversleeping and to stay with his sexual objects at home (that is, to keep to masturbation) corresponded to his resistance.

In connection with his repeating the word 'phenyl', he told me that he had always been very fond of all these radicals ending in '-yl', because they were so easy to use: benzyl, acetyl, etc. This explained nothing. But when I suggested '*Schlemihl*' to him as another radical in the series, he laughed heartily and told me that in the course of the summer he had read a book by Marcel Prevost in which there was a chapter on '*Les exclus de l'amour*' which in fact included some remarks upon '*les Schlémiliés*'. When he read them he had said to himself: 'This is just what I'm like.' - If he had missed the appointment it would have been another example of his 'Schlemihlness'.

It would seem that the occurrence of sexual symbolism in dreams has already been experimentally confirmed by some work carried out by K. Schrötter, on lines proposed by H. Swoboda. Subjects under deep hypnosis were given suggestions by Schrötter, and these led to the production of dreams a large part of whose content was determined by the suggestions. If he gave a suggestion that the subject should dream of normal or abnormal sexual intercourse, the dream, in obeying the suggestion, would make use of symbols familiar to us from psycho-analysis in place of the sexual material. For instance, when a suggestion was made to a female subject that she should dream of having homosexual intercourse with a friend, the friend appeared in the dream carrying a shabby hand-bag with a label stuck on to it bearing the words 'Ladies only.' The woman who dreamt this was said never to have had any knowledge of symbolism in dreams or of their interpretation. Difficulties are, however, thrown in the way of our forming an opinion of the value of these interesting experiments by the unfortunate circumstance that Dr. Schrötter committed suicide soon after making them. The only record of them is to be found in a preliminary communication published in the *Zentralblatt für Psychoanalyse* (Schrötter, 1912).

Similar findings were published by Roffenstein in 1923. Some experiments made by Betlheim and Hartmann (1924) were of particular interest, since they made no use of hypnosis. These experimenters related anecdotes of a coarsely sexual character to patients suffering from Korsakoff's syndrome and observed the distortions which occurred when the anecdotes were reproduced by the patients in these confusional states. They found that the symbols familiar to us from the interpretation of dreams made their appearance (e.g. going upstairs, stabbing and shooting as symbols of copulation, and knives and cigarettes as symbols of the penis). The authors attached special importance to the appearance of the symbol of a staircase, for, as they justly observed, 'no conscious desire to distort could have arrived at a symbol of such a kind.'

It is only now, after we have properly assessed the importance of symbolism in dreams, that it becomes possible for us to take up the theme of typical dreams, which was broken off on p. 541 above. I think we are justified in dividing such dreams roughly into two classes: those which really always have the same meaning, and those which, in spite of having the same or a similar content, must nevertheless be interpreted in the greatest variety of ways. Among typical dreams of the first class I have already dealt in some detail with examination dreams.

Dreams of missing a train deserve to be put alongside examination dreams on account of the similarity of their affect, and their explanation shows that we shall be right in doing so. They are dreams of consolation for another kind of anxiety felt in sleep - the fear of dying. 'Departing' on a journey is one of the commonest and best authenticated symbols of death. These dreams say in a consoling way: 'Don't worry, you won't die (depart)', just as examination dreams say soothingly: 'Don't be afraid, no harm will come to you this time either.' The difficulty of understanding both these kinds of dreams is due to the fact that the feeling of anxiety is attached precisely to the expression of consolation.

The meaning of dreams 'with a dental stimulus', which I often had to analyse in patients, escaped me for a long time because, to my surprise, there were invariably too strong resistances against their interpretation. Overwhelming evidence left me at last in no doubt that in males the motive force of these dreams was derived from nothing other than the masturbatory desires of the pubertal period. I will analyse two dreams of this kind, one of which is also a 'flying dream.' They were both dreamt by the same person, a young man with strong homosexual leanings, which were, however, inhibited in real life.

He was attending a performance of 'Fidelio' and was sitting in the stalls at the Opera besides L., a man who was congenial to him and with whom he would have liked to make friends. Suddenly he flew through the air right across the stalls, put his hand in his mouth and pulled out two of his teeth.

He himself said of the flight that it was as though he was being 'thrown' into the air. Since it was a performance of *Fidelio*, the words:

Wer ein holdes Weib errungen . . .

might have seemed appropriate. But the gaining of even the loveliest woman was not among the dreamer's wishes. Two other lines were more to the point:

Wem der *grosse Wurf* gelungen,
Eines Freundes Freund zu sein . . .¹

The dream in fact contained this 'great throw', which, however, was not only a wish-fulfilment. It also concealed the painful reflection that the dreamer had often been unlucky in his attempts at friendship, and had been 'thrown out'. It concealed, too, his fear that this misfortune might be repeated in relation to the young man by whose side he was enjoying the performance of *Fidelio*. And now followed what the fastidious dreamer regarded as a shameful confession: that once, after being rejected by one of his friends, he had masturbated twice in succession in the state of sensual excitement provoked by his desire.

Here is the second dream: *He was being treated by two University professors of his acquaintance instead of by me. One of them was doing something to his penis. He was afraid of an operation. The other was pushing against his mouth with an iron rod, so that he lost one or two of his teeth. He was tied up with four silk cloths.*

It can scarcely be doubted that this dream had a sexual meaning. The silk cloths identified him with a homosexual whom he knew. The dreamer had never carried out coitus and had never aimed at having sexual intercourse with men in real life; and he pictured sexual intercourse on the model of the pubertal masturbation with which he had once been familiar.

¹ [Wem der grosse Wurf gelungen,
Eines Freundes Freund zu sein,
Wer ein holdes Weib errungen . . .

'He who has won the *great throw* of becoming the friend of a friend, he who has gained a lovely woman . . .!']

The many modifications of the typical dream with a dental stimulus (dreams, for instance, of a tooth being pulled out by someone else, etc.) are, I think, to be explained in the same way.¹ It may, however, puzzle us to discover how 'dental stimuli' have come to have this meaning. But I should like to draw attention to the frequency with which sexual repression makes use of transpositions from a lower to an upper part of the body. Thanks to them it becomes possible in hysteria for all kinds of sensations and intentions to be put into effect, if not where they properly belong - in relation to the genitals, at least in relation to other, unobjectionable parts of the body. One instance of a transposition of this kind is the replacement of the genitals by the face in the symbolism of unconscious thinking. Linguistic usage follows the same line in recognizing the buttocks as homologous to the cheeks, and by drawing a parallel between the '*labia*' and the lips which frame the aperture of the mouth. Comparisons between nose and penis are common, and the similarity is made more complete by the presence of hair in both places. The one structure which affords no possibility of an analogy is the teeth; and it is precisely this combination of similarity and dissimilarity which makes the teeth so appropriate for representational purposes when pressure is being exercised by sexual repression.

I cannot pretend that the interpretation of dreams with a dental stimulus as dreams of masturbation - an interpretation whose correctness seems to me beyond doubt - has been entirely cleared up.² I have given what explanation I can and must leave what remains unsolved. But I may draw attention to another parallel to be found in linguistic usage. In our part of the world the act of masturbation is vulgarly described as '*sich einen ausreissen*' or '*sich einen herunterreissen*'.³ I know nothing of the source of this terminology or of the imagery on which it is based; but 'a tooth' would fit very well into the first of the two phrases.

¹ [Footnote added 1914:] A tooth being pulled out by someone else in a dream is as a rule to be interpreted as castration (like having one's hair cut by a barber, according to Stekel). A distinction must in general be made between dreams with a dental stimulus and dentist dreams, such as those recorded by Coriat (1913).

² [Footnote added 1909:] A communication by C. G. Jung informs us that dreams with a dental stimulus occurring in women have the meaning of birth dreams. - [Added 1919:] Ernest Jones has brought forward clear confirmation of this. The element in common between this interpretation and the one put forward above lies in the fact that in both cases (castration and birth) what is in question is the separation of a part of the body from the whole.

³ [Footnote added 1911:] Cf. the 'biographical' dream on p. 817, n. 2.

According to popular belief dreams of teeth being pulled out are to be interpreted as meaning the death of a relative, but psycho-analysis can at most confirm this interpretation only in the joking sense I have alluded to above. In this connection, however, I will quote a dream with a dental stimulus that has been put at my disposal by Otto Rank.

'A colleague of mine, who has for some time been taking a lively interest in the problems of dream-interpretation, has sent me the following contribution to the subject of dreams with a dental stimulus.

"A short time ago I had a dream that *I was at the dentist's and he was drilling a back tooth in my lower jaw. He worked on it so long that the tooth became useless. He then seized it with a forceps and pulled it out with an effortless ease that excited my astonishment. He told me not to bother about it, for it was not the tooth that he was really treating, and put it on the table, where the tooth (as it now seemed to me, an upper incisor) fell apart into several layers. I got up from the dentist's chair, went closer to it with a feeling of curiosity, and raised a medical question which interested me. The dentist explained to me, while he separated out the various portions of the strikingly white tooth and crushed them up (pulverized them) with an instrument, that it was connected with puberty and that it was only before puberty that teeth came out so easily, and that in the case of women the decisive factor was the birth of a child.*

"I then became aware (while I was half asleep, I believe) that the dream had been accompanied by an emission, which I could not attach with certainty, however, to any particular part of the dream; I was most inclined to think that it had already occurred while the tooth was being pulled out.

"I then went on to dream of an occurrence which I can no longer recall, but which ended *with my leaving my hat and coat somewhere (possibly in the dentist's cloakroom) in the hope that someone would bring them after me, and with my hurrying off, dressed only in my overcoat, to catch a train which was starting. I succeeded at the last moment in jumping on to the hindmost carriage where someone was already standing. I was not able, though, to make my way into the inside of the carriage, but was obliged to travel in an uncomfortable situation, from which I tried, successfully in the end, to escape. We entered a big tunnel and two trains, going in the opposite direction to us, passed through our train as if it were the tunnel. I was looking into a carriage window as though I were outside.*

"The following experiences and thoughts from the previous day provide material for an interpretation of the dream:

"(I.) I had in fact been having dental treatment recently, and at the time of the dream I was having continual pain in the tooth in the lower jaw which was being drilled in the dream and at which the dentist had, again in reality, worked longer than I liked. On the morning of the dream-day I had once more been to the dentist on account of the pain; and he had suggested to me that I should have another tooth pulled out in the same jaw as the one he had been treating, saying that the pain probably came from this other one. This was a 'wisdom tooth' which I was cutting just then. I had raised a question touching his medical conscience in that connection.

"(II.) On the afternoon of the same day, I had been obliged to apologize to a lady for the bad temper I was in owing to my toothache; whereupon she had told me she was afraid of having a root pulled out, the crown of which had crumbled away almost entirely. She thought that pulling out 'eye-teeth' was especially painful and dangerous, although on the other hand one of her acquaintances had told her that it was easier to pull out teeth in the upper jaw, which was where hers was. This acquaintance had also told her that he had once had the wrong tooth pulled out under an anaesthetic, and this had increased her dread of the necessary operation. She had then asked me whether 'eye-teeth' were molars or canines, and what was known about them. I pointed out to her on the one hand the superstitious element in all these opinions, though at the same time I emphasized the nucleus of truth in certain popular views. She was then able to repeat to me what she believed was a very old and wide-spread popular belief - that if a pregnant woman had toothache she would have a boy.

“(III.) This saying interested me in connection with what Freud says in his *Interpretation of Dreams* on the typical meaning of dreams with a dental stimulus as substitutes for masturbation, since in the popular saying a tooth and male genitals (or a boy) were also brought into relation with each other. On the evening of the same day, therefore, I read through the relevant passage in the *Interpretation of Dreams* and found there amongst other things the following statements whose influence upon my dream may be observed just as clearly as that of the other two experiences I have mentioned. Freud writes of dreams with a dental stimulus that ‘in males the motive force of these dreams was derived from nothing other than the masturbatory desires of the pubertal period’. And further: ‘The many modifications of the typical dream with a dental stimulus (dreams, for instance, of a tooth being pulled out by someone else, etc.) are, I think, to be explained in the same way. It may, however, puzzle us to discover how "dental stimuli" should have come to have this meaning. But I should like to draw attention to the frequency with which sexual repression makes use of transpositions from a lower to an upper part of the body.’ (In the present dream from the lower jaw to the upper jaw.) ‘Thanks to them it becomes possible in hysteria for all kinds of sensations and intentions to be put into effect, if not where they properly belong - in relation to the genitals, at least in relation to other, unobjectionable parts of the body’. And again: ‘But I may draw attention to another parallel to be found in linguistic usage. In our part of the world the act of masturbation is vulgarly described as "*sich einen ausreissen*" or "*sich einen herunterreissen*". I was already familiar with this expression in my early youth as a description of masturbation, and no experienced dream-interpreter will have any difficulty in finding his way from here to the infantile material underlying the dream. I will only add that the ease with which the tooth in the dream, which after its extraction turned into an upper incisor, came out, reminded me of an occasion in my childhood on which I myself pulled out a loose upper front tooth easily and without pain. This event, which I can still remember clearly to-day in all its details, occurred at the same early period to which my first conscious attempts at masturbation go back. (This was a screen memory.)

"Freud's reference to a statement by C. G. Jung to the effect that 'dreams with a dental stimulus occurring in women have the meaning of birth dreams', as well as the popular belief in the significance of toothache in pregnant women, accounted for the contrast drawn in the dream between the decisive factor in the case of females and of males (puberty). In this connection I recall an earlier dream of mine which I had soon after a visit to the dentist and in which I dreamt that the gold crowns which had just been fixed fell out; this annoyed me very much in the dream on account of the considerable expense in which I had been involved and which I had not yet quite got over at the time. This other dream now became intelligible to me (in view of a certain experience of mine) as a recognition of the material advantages of masturbation over object-love: the latter, from an economic point of view, was in every respect less desirable (cf. the gold crowns); and I believe that the lady's remark about the significance of toothache in pregnant women had re-awakened these trains of thought in me."

'So much for the interpretation put forward by my colleague, which is most enlightening and to which, I think, no objections can be raised. I have nothing to add to it, except, perhaps, a hint at the probable meaning of the second part of the dream. This seems to have represented the dreamer's transition from masturbation to sexual intercourse, which was apparently accomplished with great difficulty - (cf. the tunnel through which the trains went in and out in various directions) as well as the danger of the latter (cf. pregnancy and the overcoat). The dreamer made use for this purpose of the verbal bridges "*Zahn-ziehen (Zug)*" and "*Zahn-reissen (Reisen)*".

'On the other hand, theoretically, the case seems to me interesting in two respects. In the first place, it brings evidence in favour of Freud's discovery that ejaculation in a dream accompanies the act of pulling out a tooth. In whatever form the emission may appear, we are obliged to regard it as a masturbatory satisfaction brought about without the assistance of any mechanical stimulation. Moreover, in this case, the satisfaction accompanying the emission was not, as it usually is, directed to an object, even if only to an imaginary one, but had no object, if one may say so; it was completely auto-erotic, or at the most showed a slight trace of homosexuality (in reference to the dentist).

'The second point which seems to me to deserve emphasis is the following. It may plausibly be objected that there is no need at all to regard the present case as confirming Freud's view, since the events of the previous day would be sufficient in themselves to make the content of the dream intelligible. The dreamer's visit to the dentist, his conversation with the lady and his reading of the *Interpretation of Dreams* would quite sufficiently explain how he came to produce this dream, especially as his sleep was disturbed by toothache; they would even explain, if need be, how the dream served to dispose of the pain which was disturbing his sleep - by means of the idea of getting rid of the painful tooth and by simultaneously drowning with libido the painful sensation which the dreamer feared. But even if we make the greatest possible allowance for all this, it cannot be seriously maintained that the mere reading of Freud's explanations could have established in the dreamer the connection between pulling out a tooth and the act of masturbation, or could even have put that connection into operation, unless it had been laid down long since, as the dreamer himself admits it was (in the phrase "*sich einen ausreissen*"). This connection may have been revived not only by his conversation with the lady but by a circumstance which he reported subsequently. For in reading the *Interpretation of Dreams* he had been unwilling, for comprehensible reasons, to believe in this typical meaning of dreams with a dental stimulus, and had felt a desire to know whether that meaning applied to *all* dreams of that sort. The present dream confirmed the fact that this was so, at least as far as he was concerned, and thus showed him why it was that he had been obliged to feel doubts on the subject. In this respect too, therefore, the dream was the fulfilment of a wish namely, the wish to convince himself of the range of application and the validity of this view of Freud's.'

The second group of typical dreams include those in which the dreamer flies or floats in the air, falls, swims, etc. What is the meaning of such dreams? It is impossible to give a general reply. As we shall hear, they mean something different in every instance; it is only the raw material of sensations contained in them which is always derived from the same source.

The information provided by psycho-analyses forces me to conclude that these dreams, too, reproduce impressions of childhood; they relate, that is, to games involving movement, which are extraordinarily attractive to children. There cannot be a single uncle who has not shown a child how to fly by rushing across the room with him in his outstretched arms, or who has not played at letting him fall by riding him on his knee and then suddenly stretching out his leg, or by holding him up high and then suddenly pretending to drop him. Children are delighted by such experiences and never tire of asking to have them repeated, especially if there is something about them that causes a little fright or giddiness. In after years they repeat these experiences in dreams; but in the dreams they leave out the hands which held them up, so that they float or fall unsupported. The delight taken by young children in games of this kind (as well as in swings and see-saws) is well known; when they come to see acrobatic feats in a circus their memory of such games is revived. Hysterical attacks in boys sometimes consist merely in reproductions of feats of this kind, carried out with great skill. It not uncommonly happens that these games of movement, though innocent in themselves, give rise to sexual feelings. Childish romping [*'Hetzen'*], if I may use a word which commonly describes all such activities, is what is being repeated in dreams of flying, falling, giddiness and so on; while the pleasurable feelings attached to these experiences are transformed into anxiety. But, often enough, as every mother knows, romping among children actually ends in squabbling and tears.

Thus I have good grounds for rejecting the theory that what provokes dreams of flying and falling is the state of our tactile feelings during sleep or sensations of the movement of our lungs, and so on. In my view these sensations are themselves reproduced as part of the memory to which the dream goes back: that is to say, they are part of the *content* of the dream and not its source.¹

¹ [*Footnote added 1930:*] These remarks on dreams of movement are repeated here, since the present context requires them. See above, p. 747 f.

This material, then, consisting of sensations of movement of similar kinds and derived from the same source, is used to represent dream-thoughts of every possible sort. Dreams of flying or floating in the air (as a rule, pleasurably toned) require the most various interpretations; with some people these interpretations have to be of an individual character, whereas with others they may even be of a typical kind. One of my women patients used very often to dream that she was floating at a certain height over the street without touching the ground. She was very short, and she dreaded the contamination involved in contact with other people. Her floating dream fulfilled her two wishes, by raising her feet from the ground and lifting her head into a higher stratum of air. In other women I have found that flying dreams expressed a desire 'to be like a bird'; while other dreamers became angels during the night because they had not been called angels during the day. The close connection of flying with the idea of birds explains how it is that in men flying dreams usually have a grossly sensual meaning; and we shall not be surprised when we hear that some dreamer or other is very proud of his powers of flight.

Dr. Paul Federn (of Vienna) has put forward the attractive theory that a good number of these flying dreams are dreams of erection; for the remarkable phenomenon of erection, around which the human imagination has constantly played, cannot fail to be impressive, involving as it does an apparent suspension of the laws of gravity. (Cf. in this connection the winged phalli of the ancients.)

It is a remarkable fact that Mourly Vold, a sober-minded investigator of dreams and one who is disinclined to interpretation of any kind, also supports the erotic interpretation of flying or floating dreams (Vold, 1910-12, 2, 791). He speaks of the erotic factor as 'the most powerful motive for floating dreams', draws attention to the intense feeling of vibration in the body that accompanies such dreams and points to the frequency with which they are connected with erections or emissions.

Dreams of falling, on the other hand, are more often characterized by anxiety. Their interpretation offers no difficulty in the case of women, who almost always accept the symbolic use of falling as a way of describing a surrender to an erotic temptation. Nor have we yet exhausted the infantile sources of dreams of falling. Almost every child has fallen down at one time or other and afterwards been picked up and petted; or if he has fallen out of his cot at night, has been taken into bed with his mother or nurse.

People who have frequent dreams of swimming and who feel great joy in cleaving their way through the waves, and so on, have as a rule been bed-wetters and are repeating in their dreams a pleasure which they have long learnt to forgo. We shall learn presently from more than one example what it is that dreams of swimming are most easily used to represent.

The interpretation of dreams of fire justifies the nursery law which forbids a child to 'play with fire' - so that he shall not wet his bed at night. For in their case, too, there is an underlying recollection of the enuresis of childhood. In my 'Fragment of an Analysis of a Case of Hysteria', I have given a complete analysis and synthesis of a fire dream of this kind in connection with the dreamer's case history, and I have shown what impulses of adult years this infantile material can be used to represent.

It would be possible to mention a whole number of other 'typical' dreams if we take the term to mean that the same manifest dream-content is frequently to be found in the dreams of different dreamers. For instance we might mention dreams of passing through narrow streets or of walking through whole suites of rooms, and dreams of burglars - against whom, incidentally, nervous people take precautions *before* they go to sleep; dreams of being pursued by wild animals (or by bulls or horses) or of being threatened with knives, daggers or lances - these last two classes being characteristic of the manifest content of the dreams of people who suffer from anxiety - and many more. An investigation specially devoted to this material would thoroughly repay the labour involved. But instead of this I have two observations to make, though these do not apply exclusively to typical dreams.

The more one is concerned with the solution of dreams, the more one is driven to recognize that the majority of the dreams of adults deal with sexual material and give expression to erotic wishes. A judgement on this point can be formed only by those who really analyse dreams, that is to say, who make their way through their manifest content to the latent dream-thoughts, and never by those who are satisfied with making a note of the manifest content alone (like Näcke, for instance, in his writings on sexual dreams). Let me say at once that this fact is not in the least surprising but is in complete harmony with the principles of my explanation of dreams. No other instinct has been subjected since childhood to so much suppression as the sexual instinct with its numerous components (cf. my *Three Essays on the Theory of Sexuality*, 1905d); from no other instinct are so many and such powerful unconscious wishes left over, ready to produce dreams in a state of sleep. In interpreting dreams we should never forget the significance of sexual complexes, though we should also, of course, avoid the exaggeration of attributing exclusive importance to them.

We can assert of many dreams, if they are carefully interpreted, that they are bisexual, since they unquestionably admit of an 'over-interpretation' in which the dreamer's homosexual impulses are realized - impulses, that is, which are contrary to his normal sexual activities. To maintain, however, as do Stekel (1911) and Adler (1910, etc.), that *all* dreams are to be interpreted bisexually appears to me to be a generalization which is equally undemonstrable and unplausible and which I am not prepared to support. In particular, I cannot dismiss the obvious fact that there are numerous dreams which satisfy needs other than those which are erotic in the widest sense of the word: dreams of hunger and thirst, dreams of convenience, etc. So, too, such statements as that 'the spectre of death is to be found behind every dream' (Stekel), or that 'every dream shows an advance from the feminine to the masculine line' (Adler), appear to me to go far beyond anything that can be legitimately maintained in dream-interpretation.

The assertion that all dreams require a sexual interpretation, against which critics rage so incessantly, occurs nowhere in my *Interpretation of Dreams*. It is not to be found in any of the numerous editions of this book and is in obvious contradiction to other views expressed in it.

I have already shown elsewhere that strikingly innocent dreams may embody crudely erotic wishes, and I could confirm this by many new instances. But it is also true that many dreams which appear to be *indifferent* and which one would not regard as in any respect peculiar lead back on analysis to wishful impulses which are unmistakably sexual and often of an unexpected sort. Who, for instance, would have suspected the presence of a sexual wish in the following dream before it had been interpreted? The dreamer gave this account of it: *Standing back a little behind two stately palaces was a little house with closed doors. My wife led me along the piece of street up to the little house and pushed the door open; I then slipped quickly and easily into the inside of a court which rose in an incline.* Anyone, however, who has had a little experience in translating dreams will at once reflect that penetrating into narrow spaces and opening closed doors are among the commonest sexual symbols, and will easily perceive in this dream a representation of an attempt at *coitus a tergo* (between the two stately buttocks of the female body). The narrow passage rising in an incline stood, of course, for the vagina. The assistance attributed by the dreamer to his wife forces us to conclude that in reality it was only consideration for her that restrained the dreamer from making attempts of this kind. It turned out that on the dream-day a girl had come to live in the dreamer's household who had attracted him and had given him the impression that she would raise no great objections to an approach of that kind. The little house between the two palaces was a reminiscence of the Hradshin in Prague and was a further reference to the same girl, who came from that place.

When I insist to one of my patients on the frequency of Oedipus dreams, in which the dreamer has sexual intercourse with his own mother, he often replies: 'I have no recollection of having had any such dream.' Immediately afterwards, however, a memory will emerge of some other inconspicuous and indifferent dream, which the patient has dreamt repeatedly. Analysis then shows that this is in fact a dream with the same content - once more an Oedipus dream. I can say with certainty that *disguised* dreams of sexual intercourse with the dreamer's mother are many times more frequent than straightforward ones.¹

¹ [Footnote added 1911:] I have published elsewhere a typical example of a disguised Oedipus dream of this kind. [Reprinted below.] Another example, with a detailed analysis, has been published by Otto Rank (1911a). - [Added 1914:] For some other disguised Oedipus dreams, in which eye-symbolism is prominent, see Rank (1913). Other papers on eye-dreams and eye-symbolism, by Eder, Ferenczi and Reitler will be found in the same place. The blinding in the legend of Oedipus, as well as elsewhere, stands for castration. - [Added 1911:] Incidentally, the symbolic interpretation of undisguised Oedipus dreams was not unknown to the ancients. Rank (1910, 534) writes: 'Thus Julius Caesar is reported to have had a dream of sexual intercourse with his mother which was explained by the dream-interpreters as a favourable augury for his taking possession of the earth (Mother Earth). The oracle given to the Tarquins is equally well known, which prophesied that the conquest of Rome would fall to that one of them who should first kiss his mother ("*osculum matri tulerit*"). This was interpreted by Brutus as referring to Mother Earth. ("*Terram osculo contigit, scilicet quod ea communis mater omnium mortalium eese*") Livy, I, 56.)' - [Added 1914:] Compare in this connection the dream of Hippias reported by Herodotus (VI, 107): 'As for the Persians, they were guided to Marathon by Hippias son of Pisistratus. Hippias in the past night had seen a vision in his sleep wherein he thought that he lay with his own mother; he interpreted this dream to signify that he should return to Athens and recover his power, and so die an old man in his own mother-country.' - [Added 1911:] These myths and interpretations reveal a true psychological insight. I have found that people who know that they are preferred or favoured by the mother give evidence in their lives of a peculiar self-reliance and an unshakeable optimism which often seem like heroic attributes and bring actual success to their possessors.

[Added 1925:] 'TYPICAL EXAMPLE OF A DISGUISED OEDIPUS DREAM: A man dreamt that *he had a secret liaison with a lady whom someone else wanted to marry. He was worried in case this other man might discover the liaison and the proposed marriage came to nothing. He therefore behaved in a very affectionate way to the man. He embraced him and kissed him.* - There was only one point of contact between the content of this dream and the facts of the dreamer's life. He had a secret *liaison* with a married woman; and an ambiguous remark made by her husband, who was a friend of his, led him to suspect that the husband might have noticed something. But in reality there was something else involved, all mention of which was avoided in the dream but which alone provided a key to its understanding. The husband's life was threatened by an organic illness. His wife was prepared for the possibility of his dying suddenly, and the dreamer was consciously occupied with an intention to marry the young widow after her husband's death. This external situation placed the dreamer in the constellation of the Oedipus dream. His wish was capable of killing the man in order to get the woman as his wife. The dream expressed this wish in a hypocritically distorted form. Instead of her being married already, he made out that someone else wanted to marry her, which corresponded to his *own* secret intentions; and his hostile wishes towards her husband were concealed behind demonstrations of affection which were derived from his memory of his relations with his own father in childhood.'

In some dreams of landscapes or other localities emphasis is laid in the dream itself on a convinced feeling of having been there once before. (Occurrences of '*déjà vu*' in dreams have a special meaning.) These places are invariably the genitals of the dreamer's mother; there is indeed no other place about which one can assert with such conviction that one has been there once before.

On one occasion only I was perplexed by an obsessional neurotic who told me a dream in which he was visiting a house that he had been in *twice* before. But this particular patient had told me a considerable time before of an episode during his sixth year. On one occasion he had been sharing his mother's bed and misused the opportunity by inserting his finger into her genitals while she was asleep.

A large number of dreams, often accompanied by anxiety and having as their content such subjects as passing through narrow spaces or being in water, are based upon phantasies of intra-uterine life, of existence in the womb and of the act of birth. What follows was the dream of a young man who, in his imagination, had taken advantage of an intra-uterine opportunity of watching his parents copulating.

He was in a deep pit with a window in it like the one in the Semmering Tunnel. At first he saw an empty landscape through the window, but then invented a picture to fit the space, which immediately appeared and filled in the gap. The picture represented a field which was being ploughed up deeply by some implement; and the fresh air together with the idea of hard work which accompanied the scene, and the blue-black clods of earth, produced a lovely impression. He then went on further and saw a book upon education open in front of him . . . and was surprised that so much attention was devoted in it to the sexual feelings (of children); and this led him to think of me.

And here is a pretty water dream, dreamt by a woman patient, which served a special purpose in the treatment. *At her summer holiday resort, by the Lake of ----, she dived into the dark water just where the pale moon was mirrored in it.*

Dreams like this one are birth dreams. Their interpretation is reached by reversing the event reported in the manifest dream; thus, instead of 'diving into the water' we have 'coming out of the water', i.e. being born.¹ We can discover the locality from which a child is born by calling to mind the slang use of the word '*lune*' in French. The pale moon was thus the white bottom which children are quick to guess that they came out of. What was the meaning of the patient's wishing to be born at her summer holiday resort? I asked her and she replied without hesitation: 'Isn't it just as though I had been reborn through the treatment?' Thus the dream was an invitation to me to continue treating her at the holiday resort - that is, to visit her there. Perhaps there was a very timid hint in it, too, of the patient's wish to become a mother herself.²

¹ [Footnote added 1914:] For the mythological significance of birth from the water see Rank (1909).

² [Footnote added 1909:] It was not for a long time that I learned to appreciate the importance of phantasies and unconscious thoughts about life in the womb. They contain an explanation of the remarkable dread that many people have of being buried alive; and they also afford the deepest unconscious basis for the belief in survival after death, which merely represents a projection into the future of this uncanny life before birth. *Moreover, the act of birth is the first experience of anxiety, and thus the source and prototype of the affect of anxiety.*

I will quote another birth-dream, together with its interpretation, from a paper by Ernest Jones.) *'She stood on the sea-shore watching a small boy, who seemed to be hers, wading into the water. This he did till the water covered him and she could only see his head bobbing up and down near the surface. The scene then changed into a crowded hall of an hotel. Her husband left her, and she "entered into a conversation" with a stranger.* The second half of the dream revealed itself in the analysis as representing a flight from her husband and the entering into intimate relations with a third person The first part of the dream was a fairly evident birth-phantasy. In dreams as in mythology, the delivery of the child *from* the uterine waters is commonly presented by distortion as the entry of the child *into* water; among many others, the births of Adonis, Osiris, Moses and Bacchus are well-known illustrations of this. The bobbing up and down of the head into the water at once recalled to the patient the sensation of quickening she had experienced in her only pregnancy. Thinking of the boy going into the water induced a reverie in which she saw herself taking him out of the water, carrying him to a nursery, washing him and dressing him, and installing him in her household.

'The second half of the dream therefore represented thoughts concerning the elopement, that belonged to the first half of the underlying latent content; the first half of the dream corresponded with the second half of the latent content, the birth-phantasy. Besides this inversion in order, further inversions took place in each half of the dream. In the first half the child *entered* the water, and then his head bobbed; in the underlying dream-thoughts first the quickening occurred and then the child *left* the water (a double inversion). In the second half her husband left her; in the dream-thoughts she left her husband.'

Abraham (1909, 22 ff.) has reported another birth-dream, dreamt by a young woman who was facing her first confinement. A subterranean channel led direct into the water from a place in the floor of her room (genital canal-amniotic fluid). She raised a trap-door in the floor and a creature dressed in brown fur, very much resembling a seal, promptly appeared. This creature turned out to be the dreamer's younger brother, to whom she had always been like a mother.

Rank has shown from a series of dreams that birth-dreams make use of the same symbolism as dreams with a urinary stimulus. The erotic stimulus is represented in the latter as a urinary stimulus; and the stratification of meaning in these dreams corresponds to a change that has come over the meaning of the symbol since infancy.

This is an appropriate point at which to return to a topic that was broken off in an earlier chapter (p. 716): the problem of the part played in the formation of dreams by organic stimuli which disturb sleep. Dreams which come about under their influence openly exhibit not only the usual tendency to wish-fulfilment and to serving the end of convenience, but very often a perfectly transparent symbolism as well; for it not infrequently happens that a stimulus awakens a dreamer *after a vain attempt has been made to deal with it in a dream under a symbolic disguise*. This applies to dreams of emission or orgasm as well as to those provoked by a need to micturate or defaecate. 'The peculiar nature of emission dreams not only puts us in a position to reveal directly certain sexual symbols which are already known as being typical, but which have nevertheless been violently disputed; it also enables us to convince ourselves that some apparently innocent situations in dreams are no more than a symbolic prelude to crudely sexual scenes. The latter are as a rule represented undisguisedly in the relatively rare emission dreams, whereas they culminate often enough in anxiety dreams, which have the same result of awakening the sleeper.'

The symbolism of dreams with a urinary stimulus is especially transparent and has been recognized from the earliest times. The view was already expressed by Hippocrates that dreams of fountains and springs indicate a disorder of the bladder (Havelock Ellis). Scherner studied the multiplicity of the symbolism of urinary stimuli and asserted that 'any urinary stimulus of considerable strength invariably passes over into stimulation of the sexual regions and symbolic representations of them. . . . Dreams with a urinary stimulus are often at the same time representatives of sexual dreams.'

Otto Rank, whose discussion in his paper on the stratification of symbols in arousal dreams I am here following, has made it seem highly probable that a great number of dreams with a urinary stimulus have in fact been caused by a *sexual* stimulus which has made a first attempt to find satisfaction regressively in the infantile form of urethral erotism. Those cases are particularly instructive in which the urinary stimulus thus set up leads to awakening and emptying the bladder, but in which the dream is nevertheless continued and the need then expressed in undisguisedly erotic imagery.¹

Dreams with an intestinal stimulus throw light in an analogous fashion on the symbolism involved in them, and at the same time confirm the connection between gold and faeces which is also supported by copious evidence from social anthropology. (See Freud, 1908*b*; Rank, 1912*a*; Dattner, 1913; and Reik, 1915.) 'Thus, for instance, a woman who was receiving medical treatment for an intestinal disorder dreamt of someone who was burying a treasure in the neighbourhood of a little wooden hut which looked like a rustic out-door closet. There was a second part to the dream in which she was wiping the behind of her little girl who had dirtied herself.'

Rescue dreams are connected with birth dreams. In women's dreams, to rescue, and especially to rescue from the water, has the same significance as giving birth; but the meaning is modified if the dreamer is a man.²

Robbers, burglars and ghosts, of whom some people feel frightened before going to bed, and who sometimes pursue their victims after they are asleep, all originate from one and the same class of infantile reminiscence. They are the nocturnal visitors who rouse children and take them up to prevent their wetting their beds, or who lift the bed-clothes to make sure where they have put their hands in their sleep. Analyses of some of these anxiety-dreams have made it possible for me to identify these nocturnal visitors more precisely. In every case the robbers stood for the sleeper's father, whereas the ghosts corresponded to female figures in white night-gowns.

¹ [Footnote added 1919:] 'The same symbols which occur in their infantile aspect in bladder dreams, appear with an eminently sexual meaning in their "recent" aspects: Water = urine = semen = amniotic fluid; ship = "pump ship" (micturate) = uterus (box); to get wet = enuresis = copulation = pregnancy; to swim = full bladder = abode of the unborn; rain = micturate = symbol of fertility; travel (starting, getting out) = getting out of bed = sexual intercourse (honeymoon); micturate = emission.' (Rank, 1912*a*, 95.)

² [Footnote added 1911:] A dream of this kind has been reported by Pfister (1909). For the symbolic meaning of rescuing see Freud, 1910*d*, and Freud, 1910*h*. [Added 1914:] See also Rank (1911*b*) and Reik (1911). [Added 1919:] See further, Rank (1914).

(F)

SOME EXAMPLES - CALCULATIONS AND SPEECHES IN DREAMS

Before assigning the fourth of the factors which govern the formation of dreams to its proper place, I propose to quote a number of examples from my collection. These will serve partly to illustrate the interplay between the three factors already known to us and partly to provide confirmatory evidence for what have hitherto been unsupported assertions or to indicate some conclusions which inevitably follow from them. In giving an account of the dream-work, I have found very great difficulty in backing my findings by examples. Instances in support of particular propositions carry conviction only if they are treated in the context of the interpretation of a dream as a whole. If they are torn from their context they lose their virtue; while, on the other hand, a dream-interpretation which is carried even a little way below the surface quickly becomes so voluminous as to make us lose the thread of the train of thought which it was designed to illustrate. This technical difficulty must serve as my excuse if in what follows I string together all sorts of things, whose only common bond is their connection with the contents of the preceding sections of this chapter.

I will begin by giving a few instances of peculiar or unusual modes of representation in dreams.

A lady had the following dream: *A servant girl was standing on a ladder as if she were cleaning a window, and had a chimpanzee with her and a gorilla-cat* (the dreamer afterwards corrected this to *an angora cat*). *She hurled the animals at the dreamer; the chimpanzee cuddled up to her, which was very disgusting.* - This dream achieved its purpose by an extremely simple device: it took a figure of speech literally and gave an exact representation of its wording. 'Monkey', and animals' names in general, are used as invectives; and the situation in the dream meant neither more nor less than 'hurling invectives'. In the course of the present series of dreams we shall come upon a number of other instances of the use of this simple device during the dream-work.

Another dream adopted a very similar procedure. *A woman had a child with a remarkably deformed skull. The dreamer had heard that the child had grown like that owing to its position in the uterus. The doctor said that the skull might be given a better shape by compression, but that that would damage the child's brain. She reflected that as he was a boy it would do him less harm.* -This dream contained a plastic representation of the abstract concept of 'impressions on children' which the dreamer had met with in the course of the explanations given her during her treatment.

The dream-work adopted a slightly different method in the following instance. The dream referred to an excursion to the Hilmteich near Graz. *The weather outside was fearful. There was a wretched hotel, water was dripping from the walls of the room, the bedclothes were damp.* (The latter part of the dream was reported less directly than I have given it.) The meaning of the dream was 'superfluous'. This abstract idea, which was present in the dream-thoughts, was in the first instance given a somewhat forced twist and put into some such form as 'overflowing', 'flowing over' or 'fluid' - after which it was represented in a number of similar pictures: water outside, water on the walls inside, water in the dampness of the bed-clothes- everything flowing or 'overflowing.'

We shall not be surprised to find that, for the purpose of representation in dreams, the spelling of words is far less important than their sound, especially when we bear in mind that the same rule holds good in rhyming verse. Rank (1910, 482) has recorded in detail, and analysed very fully, a girl's dream in which the dreamer described how she was walking through the fields and cutting off rich ears ['*Ähren*'] of barley and wheat. A friend of her youth came towards her, but she tried to avoid meeting him. The analysis showed that the dream was concerned with a kiss - an 'honourable kiss' ['*Kuss in Ehren*'] pronounced the same as '*Ähren*']. In the dream itself the '*Ähren*', which had to be cut off, not pulled off, figured as ears of corn, while, condensed with '*Ehren*', they stood for a whole number of other thoughts.

On the other hand, in other cases, the course of linguistic evolution has made things very easy for dreams. For language has a whole number of words at its command which originally had a pictorial and concrete significance, but are used to-day in a colourless and abstract sense. All that the dream need do is to give these words their former, full meaning or to go back a little way to an earlier phase in their development. A man had a dream, for instance, of his brother being in a *Kasten* ['box']. In the course of interpretation the *Kasten* was replaced by a *Schrank* ['cupboard' - also used abstractly for 'barrier', 'restriction']. The dream-thought had been to the effect that his brother ought to restrict himself [*sich einschränken*] - instead of the dreamer doing so.

Another man dreamt that he climbed to the top of a mountain which commanded a quite unusually *extensive view*. Here he was identifying himself with a brother of his who was the editor of a *survey* which dealt with *far* Eastern affairs.

In *Der Grüne Heinrich* a dream is related in which a mettlesome horse was rolling about in a beautiful field of oats, each grain of which was 'a sweet almond, a raisin and a new penny piece . . . wrapped up together in red silk and tied up with a bit of pig's bristle.' The author (or dreamer) gives us an immediate interpretation of this dream-picture: the horse felt agreeably tickled and called out 'Der Hafer sticht mich!'

According to Henzen dreams involving puns and turns of speech occur particularly often in the old Norse sagas, in which scarcely a dream is to be found which does not contain an ambiguity or a play upon words.

It would be a work in itself to collect these modes of representation and to classify them according to their underlying principles. Some of these representations might almost be described as jokes, and they give one a feeling that one would never have understood them without the dreamer's help.

(1) A man dreamt that *he was asked someone's name but could not think of it*. He himself explained that what this meant was that 'he would never dream of such a thing'.

(2) A woman patient told me a dream in which *all the people were especially big*. 'That means', she went on, 'that the dream must be to do with events in my early childhood, for at that time, of course, all grown-up people seemed to me enormously big.' She herself did not appear in the content of this dream. - The fact of a dream referring to childhood may also be expressed in another way, namely by a translation of time into space. The characters and scenes are seen as though they were at a great distance, at the end of a long road, or as though they were being looked at through the wrong end of a pair of opera-glasses.

(3) A man who in his working life tended to use abstract and indefinite phraseology, though he was quite sharp-witted in general, dreamt on one occasion that *he arrived at a railway station just as a train was coming in. What then happened was that the platform moved towards the train, while the train stopped still* - an absurd reversal of what actually happens. This detail was no more than an indication that we should expect to find another reversal in the dream's content. The analysis of the dream led to the patient's recollecting some picture-books in which there were illustrations of men standing on their heads and walking on their hands.

(4) Another time the same dreamer told me a short dream which was almost reminiscent of the technique of a rebus. He dreamt that *his uncle gave him a kiss in an automobile*. He went on at once to give me the interpretation, which I myself would never have guessed: namely that it meant auto-erotism. The content of this dream might have been produced as a joke in waking life.

(5) A man dreamt that *he was pulling a woman out from behind a bed*. The meaning of this was that he was giving her preference.

(6) A man dreamt that *he was an officer sitting at a table opposite the Emperor*. This meant that he was putting himself in opposition to his father.

(7) A man dreamt that *he was treating someone for a broken limb*. The analysis showed that the broken bone [*Knochenbruch*] stood for a broken marriage [*Ehebruch*, properly 'adultery'].

(8) The time of day in dreams very often stands for the age of the dreamer at some particular period in his childhood. Thus, in one dream, 'a quarter past five in the morning' meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother.

(9) Here is another method of representing ages in a dream. A woman dreamt that *she was walking with two little girls whose ages differed by fifteen months*. She was unable to recall any family of her acquaintance to whom this applied. She herself put forward the interpretation that the two children both represented herself and that the dream was reminding her that the two traumatic events of her childhood were separated from each other by precisely that interval. One had occurred when she was three and a half, the other when she was four and three-quarters.

(10) It is not surprising that a person undergoing psycho-analytic treatment should often dream of it and be led to give expression in his dreams to the many thoughts and expectations to which the treatment gives rise. The imagery most frequently chosen to represent it is that of a journey, usually by motor-car, as being a modern and complicated vehicle. The speed of the car will then be used by the patient as an opportunity for giving vent to ironical comments. -If 'the unconscious', as an element in the subject's waking thoughts, has to be represented in a dream, it may be replaced very appropriately by subterranean regions. -These, where they occur *without* any reference to analytic treatment, stand for the female body or the womb. - 'Down below' in dreams often relates to the genitals, 'up above', on the contrary, to the face, mouth or breast. -Wild beasts are as a rule employed by the dream-work to represent passionate impulses of which the dreamer is afraid, whether they are his own or those of other people. (It then needs only a slight displacement for the wild beasts to come to represent the people who are possessed by these passions. We have not far to go from here to cases in which a dreaded father is represented by a beast of prey or a dog or wild horse - a form of representation recalling totemism.) It might be said that the wild beasts are used to represent the libido, a force dreaded by the ego and combated by means of repression. It often happens, too, that the dreamer separates off his neurosis, his 'sick personality', from himself and depicts it as an independent person.

(11) Here is an example recorded by Hanns Sachs (1911): 'We know from Freud's *Interpretation of Dreams* that the dream-work makes use of different methods for giving a sensory form to words or phrases. If, for instance, the expression that is to be represented is an ambiguous one, the dream-work may exploit the fact by using the ambiguity as a switch-point: where one of the meanings of the word is present in the dream-thoughts the other one can be introduced into the manifest dream. This was the case in the following short dream in which ingenious use was made for representational purposes of appropriate impressions of the previous day. I was suffering from a cold on the "dream-day", and I had therefore decided in the evening that, if I possibly could, I would avoid getting out of bed during the night. I seemed in the dream merely to be continuing what I had been doing during the day. I had been engaged in sticking press-cuttings into an album and had done my best to put each one in the place where it belonged. I dreamt that *I was trying to paste a cutting into the album. But it wouldn't go on to the page ["er geht nicht auf die Seite"]*, which caused me much pain. I woke up and became aware that the pain in the dream persisted in the form of a pain in my inside, and I was compelled to abandon the decision I had made before going to bed. My dream, in its capacity of guardian of my sleep, had given me the illusion of a fulfilment of my wish to stop in bed, by means of a plastic representation of the ambiguous phrase *"er geht nicht auf die Seite"* ["he isn't going to the lavatory"].'

We can go so far as to say that the dream-work makes use, for the purpose of giving a visual representation of the dream-thoughts, of any methods within its reach, whether waking criticism regards them as legitimate or illegitimate. This lays the dream-work open to doubt and derision on the part of everyone who has only *heard* of dream-interpretation but never practised it. Stekel's book, *Die Sprache des Traumes* (1911), is particularly rich in examples of this kind. I have, however, avoided quoting instances from it, on account of the author's lack of critical judgement and of the arbitrariness of his technique, which give rise to doubts even if unprejudiced minds.

(12) The following examples are taken from a paper by V. Tausk (1914) on the use of clothes and colours in dreaming.

(a) A. dreamt of *seeing a former governess of his in a dress of black lustre* ['*Lüster*'] *which fitted very tight across her buttocks*. - This was explained as meaning that the governess was lustful ['*lüstern*'].

(b) C. dreamt of *seeing a girl on the ----Road, who was bathed in white light and was wearing a white blouse*. - The dreamer had had intimate relations with a Miss White for the first time on this road.

(c) Frau D. dreamt of *seeing the eighty-year-old Viennese actor Blasel lying on a sofa in full armour* ['*in voller Rüstung*']. *He began jumping over tables and chairs, drew a dagger, looked at himself in the looking-glass and brandished the dagger in the air as though he was fighting an imaginary enemy*. - Interpretation: The dreamer suffered from a long-standing affection of the bladder ['*Blase*']. She lay on a sofa for her analysis; when she looked at herself in a looking-glass, she thought privately that in spite of her age and illness she still looked hale and hearty ['*rüsting*'].

(13) A 'GREAT ACHIEVEMENT' IN A DREAM. - A man dreamt that *he was a pregnant woman lying in bed. He found the situation very disagreeable. He called out: 'I'd rather be . . .'* (during the analysis, after calling to mind a nurse, he completed the sentence with the words 'breaking stones'). *Behind the bed there was hanging a map, the bottom edge of which was kept stretched by a strip of wood. He tore the strip of wood down by catching hold of its two ends. It did not break across but split into two halves lengthways. This action relieved him and at the same time helped on delivery.*

Without any assistance he interpreted tearing down the strip ['*Leiste*'] as a great achievement ['*Leistung*']. He was escaping from his uncomfortable situation (in the treatment) by tearing himself out of his feminine attitude The absurd detail of the strip of wood not simply breaking but splitting lengthways was explained thus: the dreamer recalled that this combination of doubling and destroying was an allusion to castration. Dreams very often represent castration by the presence of two penis symbols as the defiant expression of an antithetical wish. Incidentally, the '*Leiste*' ['groin'] is a part of the body in the neighbourhood of the genitals. The dreamer summed up the interpretation of the dream as meaning that he had got the better of the threat of castration which had led to his adopting a feminine attitude.

(14) In an analysis which I was conducting in French a dream came up for interpretation in which I appeared as an elephant. I naturally asked the dreamer why I was represented in that form. '*Vous me trompez*' ['you are deceiving me'] was his reply ('*trompe*' = 'trunk').

The dream-work can often succeed in representing very refractory material, such as proper names, by a far-fetched use of out-of-the-way associations. In one of my dreams *old Brücke had set me the task of making a dissection; . . . I fished something out that looked like a piece of crumpled silver-paper.* (I shall return to this dream later.) The association to this (at which I arrived with some difficulty) was 'stanniol.' I then perceived that I was thinking of the name of Stannius, the author of a dissertation on the nervous system of fish, which I had greatly admired in my youth. The first scientific task which my teacher set me was in fact concerned with the nervous system of a fish, *Ammocoetes*. It was clearly impossible to make use of the name of this fish in a picture puzzle.

At this point I cannot resist recording a very peculiar dream, which also deserves to be noticed as having been dreamt by a child, and which can easily be explained analytically. 'I remember having often dreamt when I was a child', said a lady, '*that God wore a paper cocked-hat on his head.* I used very often to have a hat of that sort put on my head at meals, to prevent my being able to look at the other children's plates, to see how big their helpings were. As I had heard that God was omniscient, the meaning of the dream was that I knew everything - even in spite of the hat that had been put on my head.'

The nature of the dream-work and the way in which it plays about with its material, the dream-thoughts, are instructively shown when we come to consider numbers and calculations that occur in dreams. Moreover, numbers in dreams are regarded superstitiously as being especially significant in regard to the future. I shall therefore select a few instances of this kind from my collection.

I

Extract from a dream dreamt by a lady shortly before her treatment came to an end: *She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you doing? It only costs 21 kreuzers.'* Owing to my knowledge of the dreamer's circumstances, this bit of dream was intelligible to me without any further explanation on her part. The lady came from abroad and her daughter was at school in Vienna. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The girl's school year was due to end in three weeks and this also meant the end of the lady's treatment. The day before the dream, the headmistress had asked her whether she would not consider leaving her daughter at school for another year. From this suggestion she had evidently gone on to reflect that in that case she might also continue her treatment. This was what the dream referred to. One year is equal to 365 days. The three weeks which remained both of the school-year and of the treatment were equivalent to 21 days (though the hours of treatment would be less than this). The numbers, which in the dream-thoughts referred to periods of time, were attached in the dream itself to sums of money - not but what there was a deeper meaning involved, for 'time is money.' 365 kreuzers only amount to 3 florins and 65 kreuzers; and the smallness of the sums that occurred in the dream was obviously the result of wish-fulfilment. The dreamer's wish reduced the cost both of the treatment and of the year's school-fees.

II

The numbers which occurred in another dream involved more complicated circumstances. A lady who, though she was still young, had been married for a number of years, received news that an acquaintance of hers, Elise L., who was almost exactly her contemporary, had just become engaged. Thereupon she had the following dream. *She was at the theatre with her husband. One side of the stalls was completely empty. Her husband told her that Elise L. and her fiancé had wanted to go too; but had only been able to get bad seats - three for 1 florin 50 kreuzers - and of course they could not take those. She thought it would not really have done any harm if they had.*

What was the origin of the 1 florin 50 kreuzers? It came from what was in fact an indifferent event of the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a hurry to get rid of them by buying a piece of jewellery. It is to be noticed that 150 florins is a *hundred* times as much as 1 florin 50 kreuzers. Where did the *three* come from which was the number of the theatre tickets? The only connection here was that her newly-engaged friend was the same number of months - *three* - her junior. The solution of the dream was arrived at with the discovery of the meaning of the empty stalls. They were an unmodified allusion to a small incident which had given her husband a good excuse for teasing her. She had planned to go to one of the plays that had been announced for the coming week and had taken the trouble to buy tickets several days ahead, and had therefore had to pay a booking fee. When they got to the theatre they found that one side of the house was almost empty. There had been *no need for her to be in such a hurry.*

Let me now put the dream-thoughts in place of the dream. 'It was *absurd* to marry so early. There was *no need for me to be in such a hurry.* I see from Elise L.'s example that I should have got a husband in the end. Indeed, I should have got one *a hundred times better* (a *treasure*) 'if I had only *waited* (in antithesis to her sister-in-law's *hurry*). 'My money' (or dowry) 'could have bought *three* men just as good.'

It will be observed that the meaning and context of the numbers have been altered to a far greater extent in this dream than in the former one. The processes of modification and distortion have gone further here; and this is to be explained by the dream-thoughts in this case having to overcome a specially high degree of endopsychic resistance before they could obtain representation. Nor should we overlook the fact that there was an element of absurdity in the dream, namely the *three* seats being taken by *two* people. I will anticipate my discussion of absurdity in dreams by pointing out that this absurd detail in the content of the dream was intended to represent the most strongly emphasized of the dream-thoughts, viz., 'it was *absurd* to marry so early.' The absurdity which had to find a place in the dream was ingeniously supplied by the number 3, which was itself derived from a quite immaterial point of distinction between the two people under comparison - the 3 months' difference between their ages. The reduction of the actual 150 florins to 1 florin 50 corresponded to the *low value* assigned by the dreamer to her husband (or treasure), in her suppressed thoughts.

III

The next example exhibits the methods of calculation employed by dreams, which have brought them into so much disrepute. A man had a dream that *he was settled in a chair at the B.'s* - a family with which he had been formerly acquainted - *and said to them: 'It was a great mistake your not letting me have Mali.'* - *'How old are you?'* he then went on to ask the girl. - *'I was born in 1882', she replied.* - *'Oh, so you're 28, then.'*

Since the dream dates from 1898 this was evidently a miscalculation, and the dreamer's inability to do sums would deserve to be compared with that of a general paralytic unless it could be explained in some other way. My patient was one of those people who, whenever they happen to catch sight of a woman, cannot let her alone in their thoughts. The patient who for some months used regularly to come next after him in my consulting room, and whom he thus ran into, was a young lady; he used constantly to make enquiries about her and was most anxious to create a good impression with her. It was she whose age he estimated at 28 years. So much by way of explanation of the result of the ostensible calculation. 1882, incidentally, was the year in which the dreamer had married. - I may add that he was unable to resist entering into conversation with the two other members of the female sex whom he came across in my house - the two maids (neither of them by any means youthful), one or other of whom used to open the door to him; he explained their lack of response as being due to their regarding him as an elderly gentleman of *settled* habits.

IV

Here is another dream dealing with figures, which is characterized by the clarity of the manner in which it was determined, or rather, overdetermined. I owe both the dream and its interpretation to Dr. B. Dattner. 'The landlord of my block of flats, who is a police-constable, dreamt that *he was on street-duty*. (This was a wish-fulfilment.) *An inspector came up to him, who had the number 22 followed by 62 or 26, on his collar. At any rate there were several twos on it.*

'The mere fact that in reporting the dream the dreamer broke up the number 2262 showed that its components had separate meanings. He recalled that the day before there had been some talk at the police station about the men's length of service. The occasion for it was an inspector who had retired on his pension at the age of 62. The dreamer had only served for 22 years, and it would be 2 years and 2 months before he would be eligible for a 90 percent pension. The dream represented in the first place the fulfilment of a long-cherished wish of the dreamer's to reach the rank of inspector. The superior officer with "2262" on his collar was the dreamer himself. He was on street duty - another favourite wish of his - he had served his remaining 2 years and 2 months and now, like the 62-year-old inspector, he could retire on a full pension.'¹

¹ [Footnote added 1914:] For analyses of other dreams containing numbers, see Jung, Marciniowski and others. These often imply very complicated operations with numbers, which have been carried out by the dreamer with astonishing accuracy. See also Jones (1912a)

When we take together these and some other examples which I shall give later, we may safely say that the dream-work does not in fact carry out any calculations at all, whether correctly or incorrectly; it merely throws into the *form* of a calculation numbers which are present in the dream-thoughts and can serve as allusions to matter that cannot be represented in any other way. In this respect the dream-work is treating numbers as a medium for the expression of its purpose in precisely the same way as it treats any other idea, including proper names and speeches that occur recognizably as verbal presentations.

For the dream-work cannot actually *create* speeches. However much speeches and conversations, whether reasonable or unreasonable in themselves, may figure in dreams, analysis invariably proves that all that the dream has done is to extract from the dream-thoughts fragments of speeches which have really been made or heard. It deals with these fragments in the most arbitrary fashion. Not only does it drag them out of their context and cut them in pieces, incorporating some portions and rejecting others, but it often puts them together in a new order, so that a speech which appears in the dream to be a connected whole turns out in analysis to be composed of three or four detached fragments. In producing this new version, a dream will often abandon the meaning that the words originally had in the dream-thoughts and give them a fresh one.¹ If we look closely into a speech that occurs in a dream, we shall find that it consists on the one hand of relatively clear and compact portions and on the other hand of portions which serve as connecting matter and have probably been filled in at a later stage, just as, in reading, we fill in any letters or syllables that may have been accidentally omitted. Thus speeches in dreams have a structure similar to that of breccia, in which largish blocks of various kinds of stone are cemented together by a binding medium.

¹ [Footnote added 1909:] In this respect neuroses behave exactly like dreams. I know a patient one of whose symptoms is that, involuntarily and against her will she hears - i.e. hallucinates - songs or fragments of songs, without being able to understand what part they play in her mental life. (Incidentally, she is certainly not paranoic.) Analysis has shown that, by allowing herself a certain amount of licence, she puts the text of these songs to false uses. For instance in the lines '*Leise, leise, Fromme Weise!*' [literally, 'Softly, softly, devout melody'] the last word was taken by her unconscious as though it was spelt '*Waise*' [= 'orphan', thus making the lines read 'Softly, softly, pious orphan'], the orphan being herself. Again '*O du selige, o du fröhliche*' ['Oh thou blessed and happy . . .'] is the opening of a Christmas carol; by not continuing the quotation to the word 'Christmastide' she turned it into a bridal song. -The same mechanism of distortion can also operate in the occurrence of an idea *unaccompanied* by hallucination. Why was it that one of my patients was pestered by the recollection of a poem that he had had to learn in his youth: '*Nächtlich am Busento lispeln . . .*' ['By night on the Busento whispering . . .']? Because his imagination went no further than the first part of this quotation: '*Nächtlich am Busen*' ['By night on the bosom'].

We are familiar with the fact that this same technical trick is used by parodists. Included in a series of 'Illustrations to the German Classics' published in *Fliegende Blätter* was one which illustrated Schiller's '*Siegesfest*', with the following quotation attached to it:

Und des frisch erkämpften Weibes
Freut sich der Atrid und strickt. . .

[The conqu'ring son of Atreus sits
At his fair captive's side and knits . . .]

Here the quotation broke off. In the original the lines continue:

. . . Um den Reiz des schönen Leibes
Seine Arme hochbeglückt.

[. . . His joyful and triumphant arms
About her body's lovely charms.]

Strictly speaking, this description applies only to such speeches in dreams as possess something of the sensory quality of speech, and which are described by the dreamer himself as being speeches. Other sorts of speeches, which are not, as it were, felt by him as having been heard or spoken (that is, which have no acoustic or motor accompaniments in the dream), are merely thoughts such as occur in our waking thought-activity and are often carried over unmodified into our dreams. Another copious source of undifferentiated speeches of this kind, though one which it is difficult to follow up, seems to be provided by material that has been *read*. But whatever stands out markedly in dreams as a speech can be traced back to real speeches which have been spoken or heard by the dreamer.

Instances showing that speeches in dreams have this origin have already been given by me in the course of analysing dreams which I have quoted for quite other purposes. Thus, in the 'innocent' market dream reported on p. 670, the spoken words 'that's not obtainable any longer' served to identify me with the butcher, while one portion of the other speech, 'I don't recognize that; I won't take it', was actually responsible for making the dream an 'innocent' one. The dreamer, it will be remembered, having had some suggestion made to her on the previous day by her cook, had replied with the words: 'I don't recognize that; behave yourself properly!' The innocent-sounding *first* part of this speech was taken into the dream by way of allusion to its *second* part, which fitted excellently into the phantasy underlying the dream, but would at the same time have betrayed it.

Here is another example, which will serve instead of many, all of them leading to the same conclusion.

The dreamer was in a big courtyard in which some dead bodies were being burnt. 'I'm off', he said, 'I can't bear the sight of it.' (This was definitely a speech.) *He then met two butcher's boys. 'Well', he asked, 'did it taste nice?' 'No', one of them answered, 'not a bit nice' - as though it had been human flesh.*

The innocent occasion of the dream was as follows. The dreamer and his wife had paid a visit after supper to their neighbours, who were excellent people but not precisely *appetizing*. The hospitable old lady was just having her supper and had tried to *force* him (there is a phrase with a sexual sense used jokingly among men to render this idea¹) to taste some of it. He had declined, saying he had no appetite left: 'Get along!' she had replied, 'you can manage it', or words to that effect. He had therefore been obliged to taste it and had complimented her on it saying: 'that was very nice.' When he was once more alone with his wife he had grumbled at his neighbour's insistence and also at the quality of the food. The thought, 'I can't bear the sight of it', which in the dream too failed to emerge as a speech in the strict sense, was an allusion to the physical charms of the lady from which the invitation had come, and it must be taken as meaning that he had no desire to look at them.

¹ ['*Notzüchtigen*', 'to force sexually', 'to rape', is so used in place of '*nötigen*', 'to force' (in the ordinary sense).]

More instruction can be derived from another dream, which I shall report in this connection on account of the very distinct speech which formed its centre-point, although I shall have to put off explaining it fully till I come to discuss affect in dreams. I had a very clear dream. *I had gone to Brücke's laboratory at night, and, in response to a gentle knock on the door, I opened it to (the late) Professor Fleischl, who came in with a number of strangers and, after exchanging a few words, sat down at his table.* This was followed by a second dream. *My friend Fl. had come to Vienna unobtrusively in July. I met him in the street in conversation with my (deceased) friend P., and went with them to some place where they sat opposite each other as though they were at a small table. I sat in front at its narrow end. Fl. spoke about his sister and said that in three quarters of an hour she was dead, and added some such words as 'that was the threshold.'* As P. failed to understand him, Fl. turned to me and asked me how much I had told P. about his affairs. Whereupon, overcome by strange emotions, I tried to explain to Fl, that P. (could not understand anything at all, of course, because he) was not alive. But what I actually said - and I myself noticed the mistake - was, 'NON VIXIT'. I then gave P. a piercing look. Under my gaze he turned pale; his form grew indistinct and his eyes a sickly blue - and finally he melted away. I was highly delighted at this and I now realized that Ernst Fleischl, too, had been no more than an apparition, a 'revenant'; and it seemed to me quite possible that people of that kind only existed as long as one liked and could be got rid of if someone else wished it.

This fine specimen includes many of the characteristics of dreams - the fact that I exercised my critical faculties during the dream and myself noticed my mistake when I said '*Non vixit*' instead of '*Non vivit*', my unconcerned dealings with people who were dead and were recognized as being dead in the dream itself, the absurdity of my final inference and the great satisfaction it gave me. This dream exhibits so many of these puzzling features, indeed, that I would give a great deal to be able to present the complete solution of its conundrums. But in point of fact I am incapable of doing so - of doing, that is to say, what I did in the dream, of sacrificing to my ambition people whom I greatly value. Any concealment, however, would destroy what I know very well to be the dream's meaning; and I shall therefore content myself, both here and in a later context, with selecting only a few of its elements for interpretation.

The central feature of the dream was a scene in which I annihilated P. with a look. His eyes changed to a strange and uncanny blue and he melted away. This scene was unmistakably copied from one which I had actually experienced. At the time I have in mind I had been a demonstrator at the Physiological Institute and was due to start work early in the morning. It came to Brücke's ears that I sometimes reached the students' laboratory late. One morning he turned up punctually at the hour of opening and awaited my arrival. His words were brief and to the point. But it was not they that mattered. What overwhelmed me were the terrible blue eyes with which he looked at me and by which I was reduced to nothing - just as P. was in the dream, where, to my relief, the roles were reversed. No one who can remember the great man's eyes, which retained their striking beauty even in his old age, and who has ever seen him in anger, will find it difficult to picture the young sinner's emotions.

It was a long time, however, before I succeeded in tracing the origin of the '*Non vixit*' with which I passed judgement in the dream. But at last it occurred to me that these two words possessed their high degree of clarity in the dream, not as words heard or spoken, but as words *seen*. I then knew at once where they came from. On the pedestal of the Kaiser Josef Memorial in the Hofburg in Vienna the following impressive words are inscribed:

Saluti patriae vixit
non diu sed totus.¹

I extracted from this inscription just enough to fit in with hostile train of ideas among the dream-thoughts, just enough to imply that 'this fellow has no say in the matter - he isn't even alive.' And this reminded me that I had the dream only a few days after the unveiling of the memorial to Fleischl in the cloisters of the University. At that time I had seen the Brücke memorial once again and must have reflected (unconsciously) with regret on the fact that the premature death of my brilliant friend P., whose whole life had been devoted to science, had robbed him of a well-merited claim to a memorial in these same precincts. Accordingly, I gave him this memorial in my dream; and, incidentally, as I remembered, his first name was Josef.²

¹ ['For the well-being of his country he lived not long but wholly.' - Footnote added 1925:] The actual wording of the inscription is:

Saluti publicae vixit
non diu sed totus.

The Interpretation Of Dreams

The reason for my mistake in putting '*patriae*' for '*publicae*' has probably been rightly guessed by Wittels.

² I may add as an example of over-determination that my excuse for arriving too late at the laboratory lay in the fact that after working far into the night I had in the morning to cover the long distance between the *Kaiser Josef* Strasse and the Währinger Strasse.

By the rules of dream-interpretation I was even now not entitled to pass from the *Non vixit* derived from my recollection of the Kaiser Josef Memorial to the *Non vixit* required by the sense of the dream-thoughts. There must have been some other element in the dream-thoughts which would help to make the transition possible. It then struck me as noticeable that in the scene in the dream there was a convergence of a hostile and an affectionate current of feeling towards my friend P., the former being on the surface and the latter concealed, but both of them being represented in the single phrase *Non vixit*. As he had deserved well of science I built him a memorial; but as he was guilty of an evil wish (which was expressed at the end of the dream) I annihilated him. I noticed that this last sentence had a quite special cadence, and I must have had some model in my mind. Where was an antithesis of this sort to be found, a juxtaposition like this of two opposite reactions towards a single person, both of them claiming to be completely justified and yet not incompatible? Only in one passage in literature - but a passage which makes a profound impression on the reader: in Brutus's speech of self-justification in Shakespeare's *Julius Caesar*, 'As Caesar loved me, I weep for him; as he was fortunate, I rejoice at it; as he was valiant, I honour him; but, as he was ambitious, I slew him.' Were not the formal structure of these sentences and their antithetical meaning precisely the same as in the dream-thought I had uncovered? Thus I had been playing the part of Brutus in the dream. If only I could find one other piece of evidence in the content of the dream to confirm this surprising collateral connecting link! A possible one occurred to me. '*My friend Fl. came to Vienna in July.*' There was no basis in reality for this detail of the dream. So far as I knew, my friend Fl. had never been in Vienna in July. But the month of July was named after Julius Caesar and might therefore very well represent the allusion I wanted to the intermediate thought of my playing the part of Brutus.¹

¹ There was the further connection between 'Caesar' and 'Kaiser' .

Strange to say, I really did once play the part of Brutus. I once acted in the scene between Brutus and Caesar from Schiller before an audience of children. I was fourteen years old at the time and was acting with a nephew who was a year my senior. He had come to us on a visit from England; and he, too, was a *revenant*, for it was the playmate of my earliest years who had returned in him. Until the end of my third year we had been inseparable. We had loved each other and fought with each other; and this childhood relationship, as I have already hinted above, had a determining influence on all my subsequent relations with contemporaries. Since that time my nephew John has had many reincarnations which revived now one side and now another of his personality, unalterably fixed as it was in my unconscious memory. There must have been times when he treated me very badly and I must have shown courage in the face of my tyrant; for in my later years I have often been told of a short speech made by me in my own defence when my father, who was at the same time John's grandfather, had said to me accusingly: 'Why are you hitting John? My reply - I was not yet two years old at the time - was 'I hit him 'cos he hit me.' It must have been this scene from my childhood which diverted '*Non vivit*' into '*Non vixit*', for in the language of later childhood the word for to hit is '*wichsen*'. The dream-work is not ashamed to make use of links such as this one. There was little basis in reality for my hostility to my friend P., who was very greatly my superior and for that reason was well fitted to appear as a new edition of my early playmate. This hostility must therefore certainly have gone back to my complicated childhood relations to John.

As I have said, I shall return to this dream later.

(G)

ABSURD DREAMS - INTELLECTUAL ACTIVITY IN DREAMS

In the course of our dream-interpretations we have so often come across the element of absurdity that we cannot postpone any longer the moment of investigating its source and significance, if it has any. For it will be remembered that the absurdity of dreams has provided those who deny the value of dreams with one of their principal arguments in favour of regarding them as the meaningless product of a reduced and fragmentary mental activity.

I shall begin by giving a few examples in which the absurdity is only an apparent one and disappears as soon as the meaning of the dream is more closely examined. Here are two or three dreams which deal (by chance, as it may seem at first sight) with the dreamer's dead father.

I

This is the dream of a patient who had lost his father six years earlier. *His father had met with a grave calamity. He had been travelling by the night train, which had been derailed. The carriage seats were forced together and his head was compressed from side to side. The dreamer then saw him lying in bed with a wound over his left eyebrow which ran in a vertical direction. He was surprised at his father's having met with a calamity (since he was already dead, as he added in telling me the dream). How clear his eyes were!*

According to the ruling theory of dreams we should have to explain the content of this dream as follows. To begin with, we should suppose, while the dreamer was imagining the accident, he must have forgotten that his father had been in his grave for several years; but, as the dream proceeded, the recollection must have emerged, and led to his astonishment at his own dream while he was still asleep. Analysis teaches us, however, that it is eminently useless to look for explanations of this kind. The dreamer had commissioned a bust of his father from a sculptor and had seen it for the first time two days before the dream. It was this that he had thought of as a calamity. The sculptor had never seen his father and had worked from photographs. On the day immediately before the dream the dreamer, in his filial piety, had sent an old family servant to the studio to see whether he would form the same opinion of the marble head, namely, that it was too narrow from side to side at the temples. He now proceeded to recall from his memory the material which had gone to the construction of the dream. Whenever his father was tormented by business worries or family difficulties, he had been in the habit of pressing his hands to the sides of his forehead, as though he felt that his head was too wide and wanted to compress it. -When the patient was four years old he had been present when a pistol, which had been accidentally loaded, had been discharged and had blackened his father's eyes. (*'How clear his eyes were!'*) - At the spot on his forehead at which the dream located his father's injury, a deep furrow showed during his lifetime whenever he was thoughtful or sad. The fact that this furrow was replaced in the dream by a wound led back to the second exciting cause of the dream. The dreamer had taken a photograph of his little daughter. The plate had slipped through his fingers, and when he picked it up showed a crack which ran perpendicularly down the little girl's forehead as far as her eyebrow. He could not help feeling superstitious about this, since a few days before his mother's death he had broken a photographic plate with her portrait on it.

The absurdity of this dream was thus no more than the result of a piece of carelessness in verbal expression which failed to distinguish the bust and the photograph from the actual person. We might any of us say: 'There's something wrong with Father, don't you think?' The appearance of absurdity in the dream could easily have been avoided; and if we were to judge from this single example, we should be inclined to think that the apparent absurdity had been permitted or even designed.

II

Here is another, almost exactly similar, example from a dream of my own. (I lost my father in 1896.) *After his death my father played a political part among the Magyars and brought them together politically.* Here I saw a small and indistinct picture: *a crowd of men as though they were in the Reichstag; someone standing on one or two chairs, with other people round him. I remembered how like Garibaldi he had looked on his death-bed, and fell glad that that promise had come true.*

What could be more absurd than this? It was dreamt at a time at which the Hungarians had been driven by parliamentary *obstruction* into a state of lawlessness and were plunged into the crisis from which they were rescued by Koloman Széll. The trivial detail of the scene in the dream appearing in pictures of such a small size was not without relevance to its interpretation. Our dream-thoughts are usually represented in visual pictures which appear to be more or less life-size. The picture which I saw in my dream, however, was a reproduction of a woodcut inserted in an illustrated history of Austria, which showed Maria Theresa at the Reichstag of Pressburg in the famous episode of '*Moriamur pro rege nostro*'. ['We will die for our king!']¹ Like Maria Theresa in the picture, so my father stood in the dream surrounded by the crowd. But he was *standing on one or two chairs* ['chair' = '*Stuhl*']. He had *brought them together*, and was thus a presiding judge ['*Stuhlrichter*', literally 'chair-judge']. (A connecting link was provided by the common phrase 'we shall need no judge.') -Those of us who were standing round had in fact remarked how like Garibaldi my father looked on his death bed. He had had a *post mortem* rise of temperature, his cheeks had been flushed more and more deeply red. . . . As I recalled this, my thoughts involuntarily ran on:

Und hinter ihm in wesenlosem Scheine
Lag, was uns alle bändigt, das Gemeine.²

¹ I cannot remember where I read an account of a dream which was filled with unusually small figures, and the source of which turned out to be one of Jacques Callot's etchings seen by the dreamer during the day. These etchings do in fact contain a large number of very small figures. One series of them depicts the horrors of the Thirty Years' War.

² ['Behind him, a shadowy illusion, lay what holds us all in bondage - the things that are common.']

These elevated thoughts prepared the way for the appearance of something that was common [*'gemein'*] in another sense. My father's *post mortem* rise of temperature corresponded to the words 'after his death' in the dream. His most severe suffering had been caused by a complete paralysis (*obstruction*) of the intestines during his last weeks. Disrespectful thoughts of all kinds followed from this. One of my contemporaries who lost his father while he was still at his secondary school - on that occasion I myself had been deeply moved and had offered to be his friend - once told me scornfully of how one of his female relatives had had a painful experience. Her father had fallen dead in the street and had been brought home; when his body was undressed it was found that at the moment of death, or *post mortem*, he had passed a stool [*'Stuhl'*]. His daughter had been so unhappy about this that she could not prevent this ugly detail from disturbing her memory of her father. Here we have reached the wish that was embodied in this dream. 'To stand before one's children's eyes, after one's death, great and unsullied' - who would not desire this? What has become of the absurdity of the dream? Its apparent absurdity is due only to the fact that it gave a literal picture of a figure of speech which is itself perfectly legitimate and in which we habitually overlook any absurdity involved in the contradiction between its parts. In this instance, once again, it is impossible to escape an impression that the apparent absurdity is intentional and has been deliberately produced.

The frequency with which dead people appear in dreams and act and associate with us as though they were alive has caused unnecessary surprise and has produced some remarkable explanations which throw our lack of understanding of dreams into strong relief. Yet the explanation of these dreams is a very obvious one. It often happens that we find ourselves thinking: 'If my father were alive, what would he say to this?' Dreams are unable to express an 'if' of this kind except by representing the person concerned as present in some particular situation. Thus, for instance, a young man who had been left a large legacy by his grandfather, dreamt, at a time when he was feeling self-reproaches for having spent a considerable sum of money, that his grandfather was alive again and calling him to account. And when, from our better knowledge, we protest that after all the person in question is dead, what we look upon as a criticism of the dream is in reality either a consoling thought that the dead person has not lived to witness the event, or a feeling of satisfaction that he can no longer interfere in it.

There is another kind of absurdity, which occurs in dreams of dead relatives but which does not express ridicule and derision. It indicates an extreme degree of repudiation, and so makes it possible to represent a repressed thought which the dreamer would prefer to regard as utterly unthinkable. It seems impossible to elucidate dreams of this kind unless one bears in mind the fact that dreams do not differentiate between what is wished and what is real. For instance, a man who had nursed his father during his last illness and had been deeply grieved by his death, had the following senseless dream some time afterwards. *His father was alive once more and talking to him in his usual way, but* (the remarkable thing was that) *he had really died, only he did not know it.* This dream only becomes intelligible if, after the words 'but he had really died' we insert 'in consequence of the dreamer's wish', and if we explain that what 'he did not know' was that the dreamer had had this wish. While he was nursing his father he had repeatedly wished his father were dead; that is to say, he had had what was actually a merciful thought that death might put an end to his sufferings. During his mourning, after his father's death, even this sympathetic wish became a subject of unconscious self-reproach, as though by means of it he had really helped to shorten the sick man's life. A stirring up of the dreamer's earliest infantile impulses against his father made it possible for this self-reproach to find expression as a dream; but the fact that the instigator of the dream and the daytime thoughts were such worlds apart was precisely what necessitated the dream's absurdity.¹

It is true that dreams of dead people whom the dreamer has loved raise difficult problems in dream-interpretation and that these cannot always be satisfactorily solved. The reason for this is to be found in the particularly strongly marked emotional ambivalence which dominates the dreamer's relation to the dead person. It very commonly happens that in dreams of this kind the dead person is treated to begin with as though he were alive, that he then suddenly turns out to be dead and that in a subsequent part of the dream he is alive once more. This has a confusing effect. It eventually occurred to me that this alternation between death and life is intended to represent *indifference* on the part of the dreamer. ('It's all the same to me whether he's alive or dead.') This indifference is, of course, not real but merely desired; it is intended to help the dreamer to repudiate his very intense and often contradictory emotional attitudes and it thus becomes a dream-representation of his *ambivalence*. -In other dreams in which the dreamer associates with dead people, the following rule often helps to give us our bearings. If there is no mention in the dream of the fact that the dead man is dead, the dreamer is equating himself with him: he is dreaming of his own death. If, in the course of the dream, the dreamer suddenly says to himself in astonishment, 'why, he died ever so long ago', he is repudiating this equation and is denying that the dream signifies his own death. - But I willingly confess to a feeling that dream-interpretation is far from having revealed all the secrets of dreams of this character.

¹ [Footnote added 1911:] Cf. my paper on the two principles of mental functioning (1911b).

III

In the example which I shall next bring forward I have been able to catch the dream-work in the very act of intentionally fabricating an absurdity for which there was absolutely no occasion in the material. It is taken from the dream which arose from my meeting with Count Thun as I was starting for my holidays. *I was driving in a cab and ordered the driver to drive me to a station. 'Of course I can't drive with you along the railway line itself', I said, after he had raised some objection, as though I had overtired him. It was as if I had already driven with him for some of the distance one normally travels by train.* The analysis produced the following explanations of this confused and senseless story. The day before, I had hired a cab to take me to an out-of-the-way street in Dornbach. The driver, however, had not known where the street was and, as these excellent people are apt to do, had driven on and on until at last I had noticed what was happening and had told him the right way, adding a few sarcastic comments. A train of thought, to which I was later in the analysis to return, led from this cab-driver to aristocrats. For the moment it was merely the passing notion that what strikes us bourgeois plebs about the aristocracy is the preference they have for taking the driver's seat. Count Thun, indeed, was the driver of the State Coach of Austria. The next sentence in the dream, however, referred to my brother, whom I was thus identifying with the cab-driver. That year I had called off a trip I was going to make with him to Italy. ('I can't drive with you along the railway line itself.') And this cancellation had been a kind of punishment for the complaints he used to make that I was in the habit of overtiring him on such trips (this appeared in the dream unaltered) by insisting upon moving too rapidly from place to place and seeing too many beautiful things in a single day. On the evening of the dream my brother had accompanied me to the station; but he had jumped out shortly before we got there, at the suburban railway station adjoining the main line terminus, in order to travel to Purkersdorf by the suburban line. I had remarked to him that he might have stayed with me a little longer by travelling to Purkersdorf by the main line instead of the suburban one. This led to the passage in the dream in which I drove in the cab *for some of the distance one normally travels by train.* This was an inversion of what had happened in reality - a kind of '*tu quoque*' argument. What I had said to my brother was: 'you can travel on the main line in my company for the distance you would travel by the suburban line.' I brought about the whole confusion in the dream by putting 'cab' instead of 'suburban line' (which, incidentally, was of great help in bringing together the figures of the cab-driver and my brother). In this way I succeeded in producing something senseless in the dream, which it seems scarcely possible to disentangle and which was almost a direct contradiction of an earlier remark of mine in the dream ('I can't drive with you along the railway line itself.') Since, however, there was no necessity whatever for me to confuse the suburban railway and a cab, I must have arranged the whole of this enigmatic business in the dream on purpose.

But for *what* purpose? We are now to discover the significance of absurdity in dreams and the motives which lead to its being admitted or even created. The solution of the mystery in the present dream was as follows. It was necessary for me that there should be something absurd and unintelligible in this dream in connection with the word '*fahren*'¹ because the dream-thoughts included a particular judgement which called for representation. One evening, while I was at the house of the hospitable and witty lady who appeared as the 'housekeeper' in one of the other scenes in the same dream, I had heard two riddles which I had been unable to solve. Since they were familiar to the rest of the company, I cut a rather ludicrous figure in my vain attempts to find the answers. They depended upon puns on the words '*Nachkommen*' and '*Vorfahren*' and, I believe, ran as follows:

Der Herr befiehlt's,
Der Kutscher tut's.
Ein jeder hat's,
Im Grabe ruht's.

[With the master's request
The driver complies:
By all men possessed
In the graveyard it lies.]

(Answer: '*Vorfahren*' ['Drive up' and 'Ancestry'; more literally 'go in front' and 'predecessors'].)
It was particularly confusing that the first half of the second riddle was identical with that of the first:

Der Herr befiehlt's,
Der Kutscher tut's.
Nicht jeder hat's,
In der Wiege ruht's.

[With the master's request
The driver complies:
Not by all men possessed
In the cradle it lies.]

(Answer: '*Nachkommen*' ['Follow after' and 'Progeny'; more literally 'come after' and 'successors'].)

¹ [The German word '*fahren*', which has already been used repeatedly in the dream and the analysis, is used for the English 'drive' (in a cab) and 'travel' (in a train) and has had to be translated by both of those words in different contexts.]

When I saw Count Thun *drive up* so impressively and when I thereupon fell into the mood of Figaro, with his remarks on the goodness of great gentlemen in having taken the trouble to be born (to become *progeny*), these two riddles were adopted by the dream-work as intermediate thoughts. Since aristocrats could easily be confused with drivers and since there was a time in our part of the world when a driver was spoken of as '*Schwager*' ['coachman' and 'brother-in-law'], the work of condensation was able to introduce my brother into the same picture. The dream-thought, however, which was operating behind all this ran as follows: 'It is absurd to be proud of one's ancestry; it is better to be an ancestor oneself.' This judgement, that something 'is absurd', was what produced the absurdity in the dream. And this also clears up the remaining enigma in this obscure region of the dream, namely why it was that I thought I had already driven with the driver *before* [*vorhergefahren* ('driven before') - *vorgefahren* ('driven up') - '*Vorfahren*' ('ancestry')].

A dream is made absurd, then, if a judgement that something 'is absurd' is among the elements included in the dream thoughts - that is to say, if any one of the dreamer's unconscious trains of thought has criticism or ridicule as its motive. Absurdity is accordingly one of the methods by which the dream-work represents a contradiction - alongside such other methods as the reversal in the dream-content of some material relation in the dream-thoughts, or the exploitation of the sensation of motor inhibition. Absurdity in a dream, however, is not to be translated by a simple 'no'; it is intended to reproduce the *mood* of the dream-thoughts, which combines derision or laughter with the contradiction. It is only with such an aim in view that the dream-work produces anything ridiculous. Here once again *it is a giving a manifest form to a portion of the latent content*.¹

Actually we have already come across a convincing example of an absurd dream with this kind of meaning: the dream - I interpreted it without any analysis - of the performance of a Wagner opera which lasted till a quarter to eight in the morning and in which the orchestra was conducted from a tower, and so on (see p. 811 f.). It evidently meant to say: 'This is a *topsy-turvy* world and a *crazy* society; the person who deserves something doesn't get it, and the person who doesn't care about something *does* get it' - and there the dreamer was comparing her fate with her cousin's. - Nor is it by any means a matter of chance that our first examples of absurdity in dreams related to a dead father. In such cases, the conditions for creating absurd dreams are found together in characteristic fashion. The authority wielded by a father provokes criticism from his children at an early age, and the severity of the demands he makes upon them leads them, for their own relief, to keep their eyes open to any weakness of their father's; but the filial piety called up in our minds by the figure of a father, particularly after his death, tightens the censorship which prohibits any such criticism from being consciously expressed.

¹ The dream-work is thus parodying the thought that has been presented to it as something ridiculous, by the method of creating something ridiculous in connection with that thought. Heine adopted the same line when he wanted to ridicule some wretched verses written by the King of Bavaria. He did so in still more wretched ones:

Herr Ludwig ist ein grosser Poet,
Und singt er, so stürzt Apollo
Vor ihm auf die Kniee und bittet und fleht,
'Halt ein! ich werde sonst toll, o!'

[Sir Ludwig is a magnificent bard
And, as soon as he utters, Apollo
Goes down on his knees and begs him: 'Hold hard!
Or I'll shortly become a clod-poll oh!'

Lobgesänge auf König Ludwig, I]

IV

Here is another absurd dream about a dead father. *I received a communication from the town council of my birthplace concerning the fees due for someone's maintenance in the hospital in the year 1851, which had been necessitated by an attack he had had in my house. I was amused by this since, in the first place, I was not yet alive in 1851 and, in the second place, my father, to whom it might have related, was already dead. I went to him in the next room, where he was lying on his bed, and told him about it. To my surprise, he recollected that in 1851 he had once got drunk and had had to be locked up or detained. It was at a time at which he had been working for the firm of T----. 'So you used to drink as well?' I asked; 'did you get married soon after that?' I calculated of course, I was born in 1856, which seemed to be the year which immediately followed the year in question.*

We should conclude from the preceding discussion that the insistence with which this dream exhibited its absurdities could only be taken as indicating the presence in the dream-thoughts of a particularly embittered and passionate polemic. We shall therefore be all the more astonished to observe that in this dream the polemic was carried on in the open and that my father was the explicit object of the ridicule. Openness of this kind seems to contradict our assumptions as regards the working of the censorship in connection with the dream-work. The position will become clearer, however, when it is realized that in this instance my father was merely put forward as a show figure, and that the dispute was really being carried on with someone else, who only appeared in the dream in a single allusion. Whereas normally a dream deals with rebellion against someone else, behind whom the dreamer's father is concealed, the opposite was true here. My father was made into a man of straw, in order to screen someone else; and the dream was allowed to handle in this undisguised way a figure who was as a rule treated as sacred, because at the same time I knew with certainty that it was not he who was really meant. That this was so was shown by the exciting cause of the dream. For it occurred after I had heard that a senior colleague of mine, whose judgement was regarded as beyond criticism, had given voice to disapproval and surprise at the fact that the psycho-analytic treatment of one of my patients had already entered its *fifth year*. The first sentences of the dream alluded under a transparent disguise to the fact that for some time this colleague had taken over the duties which my father could no longer fulfil (*'fees due', 'maintenance in the hospital'*), and that, when our relations began to be less friendly, I became involved in the same kind of emotional conflict which, when a misunderstanding arises between a father and son, is inevitably produced owing to the position occupied by the father and the assistance formerly given by him. The dream-thoughts protested bitterly against the reproach that I was *not getting on faster* - a reproach which, applying first to my treatment of the patient, extended later to other things. Did he know anyone, I thought, who could get on more quickly? Was he not aware that, apart from my methods of treatment, conditions of that kind are altogether incurable and last a life-time? What were *four or five years* in comparison with a whole life-time, especially considering that the patient's existence had been so very much eased during the treatment?

A great part of the impression of absurdity in this dream was brought about by running together sentences from different parts of the dream-thoughts without any transition. Thus the sentence '*I went to him in the next room*', etc., dropped the subject with which the preceding sentences had been dealing and correctly reproduced the circumstances in which I informed my father of my having become engaged to be married without consulting him. This sentence was therefore reminding me of the admirable unselfishness displayed by the old man on that occasion, and contrasting it with the behaviour of someone else - of yet another person. It is to be observed that the dream was allowed to ridicule my father because in the dream-thoughts he was held up in unqualified admiration as a model to other people. It lies in the very nature of every censorship that of forbidden things it allows those which are *untrue* to be said rather than those which are *true*. The next sentence, to the effect that he recollected '*having once got drunk and been locked up for it*', was no longer concerned with anything that related to my father in reality. Here the figure for whom he stood was no less a person than the great Meynert, in whose footsteps I had trodden with such deep veneration and whose behaviour towards me, after a short period of favour, had turned to undisguised hostility. The dream reminded me that he himself had told me that at one time in his youth he had indulged in the habit of making himself *intoxicated with chloroform* and that on account of it he had had to go into a *home*. It also reminded me of another incident with him shortly before his death. I had carried on an embittered controversy with him in writing, on the subject of male hysteria, the existence of which he denied. When I visited him during his fatal illness and asked after his condition, he spoke at some length about his state and ended with these words: 'You know, I was always one of the clearest cases of male hysteria.' He was thus admitting, to my satisfaction and astonishment, what he had for so long obstinately contested. But the reason why I was able in this scene of the dream to use my father as a screen for Meynert did not lie in any analogy that I had discovered between the two figures. The scene was a concise but entirely adequate representation of a conditional sentence in the dream-thoughts, which ran in full: 'If only I had been the second generation, the son of a professor or Hofrat, I should certainly have *got on faster*.' In the dream I made my father into a Hofrat and professor. -The most blatant and disturbing absurdity in the dream resides in its treatment of the date 1851, which seemed to me not to differ from 1856, *just as though a difference of five years was of no significance whatever*. But this last was precisely what the dream-thoughts sought to express. *Four or five years* was the length of time during which I enjoyed the support of the colleague whom I mentioned earlier in this analysis; but it was also the length of time during which I made my *fiancée* wait for our marriage; and it was also, by a chance coincidence which was eagerly exploited by the dream-thoughts, the length of time during which I made my patient of longest standing wait for a complete recovery. '*What are five years?*' asked the dream-thoughts; '*that's no time at all, so far as I am concerned; it doesn't count*. I have time enough in front of me. And just as I succeeded in the end in *that*, though you would not believe it, so I shall achieve *this*, too.' Apart from this, however, the number 51 by itself, without the number of the century, was determined in another, and indeed, in an opposite sense; and this, too, is why it appeared in the dream several times. 51 is the age which seems to be a particularly dangerous one to men; I have known colleagues who have died suddenly at that age, and amongst them one who, after long delays, had been appointed to a professorship only a few days before his death.

V

Here is yet another absurd dream which plays about with numbers. *One of my acquaintances, Herr M., had been attacked in an essay with an unjustifiable degree of violence, as we all thought - by no less a person than Goethe. Herr M. was naturally crushed by the attack. He complained of it bitterly to some company at table; his veneration for Goethe had not been affected, however, by this personal experience. I tried to throw a little light on the chronological data, which seemed to me improbable. Goethe died in 1832. Since his attack on Herr M. must naturally have been made earlier than that, Herr M. must have been quite a young man at the time. It seemed to be a plausible notion that he was eighteen. I was not quite sure, however, what year we were actually in, so that my whole calculation melted into obscurity. Incidentally, the attack was contained in Goethe's well-known essay on 'Nature'.*

We shall quickly find means of justifying the nonsense in this dream. Herr M., whom I had got to know among some *company at table*, had not long before asked me to examine his brother, who was showing signs of *general paralysis*. The suspicion was correct; on the occasion of this visit an awkward episode occurred, for in the course of his conversation the patient for no accountable reason gave his brother away by talking of his *youthful follies*. I had asked the patient the year of his birth and made him do several small sums so as to test the weakness of his memory - though, incidentally, he was still able to meet the tests quite well. I could already see that I myself behaved like a paralytic in the dream. (*I was not quite sure what year we were in.*) Another part of the material of the dream was derived from another recent source. The editor of a medical journal, with whom I was on friendly terms, had printed a highly unfavourable, a '*crushing*' criticism of my Berlin friend Fl.'s last book. The criticism had been written by a very *youthful* reviewer who possessed small judgement. I thought I had a right to intervene and took the editor to task over it. He expressed lively regret at having published the criticism but would not undertake to offer any redress. I therefore severed my connection with the journal, but in my letter of resignation expressed a hope that *our personal relations would not be affected by the event*. The third source of the dream was an account I had just heard from a woman patient of her brother's mental illness, and of how he had broken out in a frenzy with cries of '*Nature! Nature!*' The doctors believed that his exclamation came from his having read Goethe's striking essay on that subject and that it showed he had been overworking at his studies in natural philosophy. I myself preferred to think of the sexual sense in which the word is used even by the less educated people here. This idea of mine was at least not disproved by the fact that the unfortunate young man subsequently mutilated his own genitals. *He was eighteen* at the time of his outbreak.

I may add that my friend's book which had been so severely criticized ('one wonders whether it is the author or oneself who is crazy', another reviewer had said) dealt with the *chronological data* of life and showed that the length of Goethe's life was a multiple of a number that has a significance in biology. So it is easy to see that in the dream I was putting myself in my friend's place. (*I tried to throw a little light on the chronological data.*) But I behaved like a paralytic, and the dream was a mass of absurdities. Thus the dream-thoughts were saying ironically: '*Naturally*, it's *he* who is the crazy fool, and it's *you* who are the men of genius and know better. Surely it can't by any chance be the reverse?' There were plenty of examples of this *reversal* in the dream. For instance, Goethe attacked the young man, which is absurd, whereas it is still easy for quite a young man to attack Goethe, who is immortal. And again, I calculated from the year of Goethe's *death*, whereas I had made the paralytic calculate from the year of his *birth*.

But I have also undertaken to show that no dream is prompted by motives other than egoistic ones. So I must explain away the fact that in the present dream I made my friend's cause my own and put myself in his place. The strength of my critical conviction in waking life is not enough to account for this. The story of the eighteen-year-old patient, however, and the different interpretations of his exclaiming '*Nature!*' were allusions to the opposition in which I found myself to most doctors on account of my belief in the sexual aetiology of the psychoneuroses. I could say to myself: 'The kind of criticism that has been applied to your friend will be applied to you - indeed, to some extent it already *has been*.' The 'he' in the dream can therefore be replaced by 'we': 'Yes, you're quite right, it's *we* who are the fools.' There was a very clear reminder in the dream that '*mea res agitur*', in the allusion to Goethe's short but exquisitely written essay; for when at the end of my school-days I was hesitating in my choice of a career, it was hearing that essay read aloud at a public lecture that decided me to take up the study of natural science.

VI

Earlier in this volume I undertook to show that another dream in which my own ego did not appear was nevertheless egoistic. On p. 746 I reported a short dream to the effect that Professor M. said: 'My son, *the Myops . . .*', and I explained that the dream was only an introductory one, preliminary to another in which I *did* play a part. Here is the missing main dream, which introduces an absurd and unintelligible verbal form which requires an explanation.

On account of certain events which had occurred in the city of Rome, it had become necessary to remove the children to safety, and this was done. The scene was then in front of a gateway, double doors in the ancient style (the 'Porta Romana' at Siena, as I was aware during the dream itself). I was sitting on the edge of a fountain and was greatly depressed and almost in tears. A female figure - an attendant or nun - brought two boys out and handed them over to their father, who was not myself. The elder of the two was clearly my eldest son; I did not see other one's face. The woman who brought out the boy asked him to kiss her good-bye. She was noticeable for having a red nose. The boy refused to kiss her, but, holding out his hand in farewell, said 'AUF GESERES' to her, and then 'AUF UNGESERES' to the two of us (or to one of us). I had a notion that this last phrase denoted a preference.¹

¹ [The words 'Geseres' and 'Ungeseres', neither of them German, are discussed below.]

This dream was constructed on a tangle of thoughts provoke by a play which I had seen, called *Das neue Ghetto*. The Jewish problem, concern about the future of one's children, to whom one cannot give a country of their own, concern about educating them in such a way that they can move freely across frontiers - all of this was easily recognizable among the relevant dream-thoughts.

'By the waters of Babylon we sat down and wept.' Siena, like Rome, is famous for its beautiful fountains. If Rome occurred in one of my dreams, it was necessary for me to find a substitute for it from some locality known to me (see p. 679 f.). Near the Port Romana in Siena we had seen a large and brightly lighted building. We learned that it was the *Manicomio*, the insane asylum. Shortly before I had the dream I had heard that a man of the same religious persuasion as myself had been obliged to resign the position which he had painfully achieved in a State asylum.

Our interest is aroused by the phrase '*Auf geseres*' (at a point at which the situation in the dream would have led one to expect '*Auf Wiedersehen*') as well as its quite meaningless opposite '*Auf Ungeseres*.' According to information I have received from philologists, '*Geseres*' is a genuine Hebrew word derived from a verb '*goiser*', and is best translated by 'imposed sufferings' or 'doom.' The use of the word in slang would incline one to suppose that it meant 'weeping and wailing.' '*Ungeseres*' was a private neologism of my own and was the first word to catch my attention, but to begin with I could make nothing of it. But the short remark at the end of the dream to the effect that '*Ungeseres*' denoted a preference over '*Geseres*' opened the door to associations and at the same time to an elucidation of the word. An analogous relationship occurs in the case of caviare; *unsalted* ['*ungesalzen*'] caviare is esteemed more highly than *salted* ['*gesalzen*']. 'Caviare to the general', aristocratic pretensions; behind this lay a joking allusion to a member of my household who, since she was younger than I, would, I hoped look after my children in the future. This tallied with the fact that another member of my household, our excellent nurse, was recognizably portrayed in the female attendant or nun in the dream. There was still, however, no transitional idea between '*salted - unsalted*' and '*Geseres - Ungeseres*.' This was provided by '*leavened - unleavened*' ['*gesäuert - ungesäuert*']. In their flight out of Egypt the Children of Israel had not time to allow their dough to rise and, in memory of this, they eat unleavened bread to this day at Easter. At this point I may insert a sudden association that occurred to me during this portion of the analysis. I remembered how, during the previous Easter, my Berlin friend and I had been walking through the streets of Breslau, a town in which we were strangers. A little girl asked me the way to a particular street, and I was obliged to confess that I did not know; and I remarked to my friend: 'It is to be hoped that when she grows up that little girl will show more discrimination in her choice of the people whom she gets to direct her.' Shortly afterwards, I caught sight of a door-plate bearing the words 'Dr. Herodes. Consulting hours: . . .' 'Let us hope', I remarked, 'that our colleague does not happen to be a children's doctor.' At this same time my friend had been telling me his views on the biological significance of *bilateral symmetry* and had begun a sentence with the words 'If we had an eye in the middle of our foreheads like a Cyclops . . .' This led to the Professor's remark in the introductory dream, '*My son, the Myops . . .*'¹ and I had now been led to the principal source of '*Geseres*'. Many years before, when this son of Professor M.'s, to-day an independent thinker, was still sitting at his school-desk, he was attacked by a disease of the eyes which, the doctor declared, gave cause for anxiety. He explained that so long as it remained *on one side* it was of no importance, but that if it passed over to the *other eye* it would be a serious matter. The affection cleared up completely in the one eye; but shortly afterwards signs in fact appeared of the other one being affected. The boy's mother, terrified, at once sent for the doctor to the remote spot in the country where they were staying. The doctor, however, now went over *to the other side*. 'Why are you making such a "*Geseres*"?' he shouted at the mother, 'if *one side* has got well, so will the *other*.' And he was right.

¹ [The German '*Myop*' is an *ad hoc* form constructed on the pattern of '*Zyklop*'.]

And now we must consider the relation of all this to me and my family. The school-desk at which Professor M.'s son took his first steps in knowledge was handed over by his mother as a gift to my eldest son, into whose mouth I put the farewell phrases in the dream. It is easy to guess one of the wishes to which this transference gave rise. But the construction of the desk was also intended to save the child from being *short-sighted* and *one-sided*. Hence the appearance in the dream of 'Myops' (and, behind it, 'Cyclops') and the reference to *bilaterality*. My concern about one-sidedness had more than one meaning: it would refer not only to physical one-sidedness but also to one sidedness of intellectual development. May it not even be that it was precisely this concern which, in its crazy way, the scene in the dream was contradicting? After the child had turned to *one side* to say farewell words, he turned to the *other side* to say the contrary, as though to restore the balance. *It was as though he was acting with due attention to bilateral symmetry!*

Dreams, then, are often most profound when they seem most crazy. In every epoch of history those who have had something to say but could not say it without peril have eagerly assumed a fool's cap. The audience at whom their forbidden speech was aimed tolerated it more easily if they could at the same time laugh and flatter themselves with the reflection that the unwelcome words were clearly nonsensical. The Prince in the play, who had to disguise himself as a madman, was behaving just as dreams do in reality; so that we can say of dreams what Hamlet said of himself, concealing the true circumstances under a cloak of wit and unintelligibility: 'I am but mad north-north-west: when the wind is southerly, I know a hawk from a hand-saw!'¹

Thus I have solved the problem of absurdity in dreams by showing that the dream-thoughts are never absurd - never, at all events, in the dreams of sane people - and that the dream-work produces absurd dreams and dreams containing individual absurd elements if it is faced with the necessity of representing any criticism, ridicule or derision which may be present in the dream-thoughts.

¹ This dream also provides a good example of the generally valid truth that dreams which occur during the same night, even though they are recollected as separate, spring from the ground-work of the same thoughts. Incidentally, the situation in the dream of my removing my children to safety from the City of Rome was distorted by being related back to an analogous event that occurred in my own childhood: I was envying some relatives who, many years earlier, had had an opportunity of removing their children to another country.

My next task is to show that the dream-work consists in nothing more than a combination of the three factors I have mentioned - and of a fourth which I have still to mention; that it carries out no other function than the translation of dream-thoughts in accordance with the four conditions to which it is subject; and that the question whether the mind operates in dreams with all its intellectual faculties or with only a part of them is wrongly framed and disregards the facts. Since, however, there are plenty of dreams in whose content judgements are passed, criticisms made, and appreciations expressed, in which surprise is felt at some particular element of the dream, in which explanations are attempted and argumentations embarked upon, I must now proceed to meet the objections arising from facts of this kind by producing some chosen examples.

My reply is as follows: *Everything that appears in dreams as the ostensible activity of the function of judgement is to be regarded not as an intellectual achievement of the dream-work but as belonging to the material of the dream-thoughts and as having been lifted from them into the manifest content of the dream as a ready-made structure.* I can even carry this assertion further. Even the judgements made *after waking* upon a dream that has been remembered, and the feelings called up in us by the reproduction of such a dream, form part, to a great extent, of the latent content of the dream and are to be included in its interpretation.

I

I have already quoted a striking example of this. A woman patient refused to tell me a dream of hers because 'it was not clear enough.' She had seen someone in the dream but did not know whether it was her husband or her father. There then followed a second piece of dream in which a dust-bin [*Misttrügerl*] appeared, and this gave rise to the following recollection. When she had first set up house she had jokingly remarked on one occasion in the presence of a young relative who was visiting in the house that her next job was to get hold of a new dust-bin. The next morning one arrived for her, but it was filled with lilies of the valley. This piece of the dream served to represent a common phrase 'not grown on my own manure'.¹ When the analysis was completed, it turned out that the dream-thoughts were concerned with the after-effects of a story, which the dreamer had heard when she was young, of how a girl had had a baby and of how it was *not clear who the father really was*. Here, then, the dream-representation had overflowed into the waking thoughts: one of the elements of the dream-thoughts had found representation in a waking judgement passed upon the dream as a whole.

II

Here is a similar case. One of my patients had a dream which struck him as interesting, for immediately after waking he said to himself: '*I must tell the doctor that.*' The dream was analysed and produced the clearest allusions to a *liaison* which he had started during the treatment and which he had decided to himself *not to tell me about*.²

¹ [*Nicht auf meinem eigenen Mist gewachsen* - meaning 'I am not responsible for that', or 'It's not my baby.' The German word '*Mist*', properly meaning manure, is used in slang for 'rubbish' and occurs in this sense in the Viennese term for a dust-bin: '*Misttrügerl*.']

² [*Footnote added 1909:*] If in the actual course of a dream dreamt during psycho-analytic treatment the dreamer says to himself: '*I must tell the doctor that*', it invariably implies the presence of a strong resistance against confessing the dream - which is not infrequently thereupon forgotten.

III

Here is a third example, one from my own experience. *I was going to the hospital with P. through a district in which there were houses and gardens. At the same time I had a notion that I had often seen this district before in dreams. I did not know my way about very well. He showed me a road that led round the corner to a restaurant (indoors, not a garden). There I asked for Frau Doni and was told that she lived at the back in a small room with three children. I went towards it, but before I got there met an indistinct figure with my two little girls; I took them with me after I had stood with them for a little while. Some sort of reproach against my wife, for having left them there.*

When I woke up I had a feeling of great *satisfaction*, the reason for which I explained to myself as being that I was going to discover from this analysis the meaning of 'I've dreamt of that before.'¹ In fact, however, the analysis taught me nothing of the kind; what it did show me was that the satisfaction belonged to the latent content of the dream and not to any judgement upon it. My satisfaction was with the fact that my marriage had brought me children. P. was a person whose course in life lay for some time alongside mine, who then out distanced me both socially and materially, but whose marriage was childless. The two events which occasioned the dream will serve, instead of a complete analysis, to indicate its meaning. The day before, I had read in a newspaper the announcement of the death of Frau Dona A----y (which I turned into 'Doni' in the dream), who had died in childbirth. My wife told me that the dead woman had been looked after by the same midwife who had attended her at the birth of our two youngest children. The name 'Dona' had struck me because I had met it for the first time a short while before in an English novel. The second occasion for the dream was provided by the date on which it occurred. It was on the night before the birthday of my eldest boy - who seems to have some poetic gifts.

¹ A protracted discussion on this subject has run through recent volumes of the *Revue Philosophique* under the title of 'Paramnesia in Dreams.'

IV

I was left with the same feeling of satisfaction when I woke from the absurd dream of my father having played a political part among the Magyars after his death; and the reason I gave myself for this feeling was that it was a continuation of the feeling that accompanied the last piece of the dream. *I remembered how like Garibaldi he had looked on his death-bed and felt glad that it had come true. . . . (There was a continuation which I had forgotten).* The analysis enabled me to fill in this gap in the dream. It was a mention of my second son, to who I had given the first name of a great historical figure who had powerfully attracted me in my boyhood, especially since my visit to England. During the year before the child's birth I had made up my mind to use this name if it were a son and I greeted the new-born baby with it with a feeling of high *satisfaction*. (It is easy to see how the suppressed megalomania of fathers is transferred in their thoughts on to their children, and it seems quite probable that this is one of the ways in which the suppression of that feeling, which becomes necessary in actual life, is carried out.) The little boy's right to appear in the context of this dream was derived from the fact that he had just had the same misadventure - easily forgivable both in a child and in a dying man - of soiling his bed-clothes. Compare in this connection *Stuhlrichter* ['presiding judge', literally 'chair-' or 'stool-judge'] and the wish expressed in the dream to stand before one's children's eyes *great* and *unsullied*.]

V

I now turn to consider expressions of judgement passed in the dream itself but not continued into waking life or transposed into it. In looking for examples of these, my task will be greatly assisted if I may make use of dreams which I have already recorded with other aims in view. The dream of Goethe's attack on Herr M. appears to contain a whole number of acts of judgement. '*I tried to throw a little light on the chronological data, which seemed to me improbable.*' This has every appearance of being a criticism of the absurd idea that Goethe should have made a literary attack on a young man of my acquaintance. '*It seemed to be a plausible notion that he was eighteen.*' This, again, sounds exactly like the outcome of a calculation, though, it is true, of a feeble-minded one. Lastly, '*I was not quite sure what year we were in*' seems like an instance of uncertainty or doubt in a dream.

Thus all of these seemed to be acts of judgement made for the first time in the dream. But analysis showed that their wording can be taken in another way, in the light of which they become indispensable for the dream's interpretation, while at the same time every trace of absurdity is removed. The sentence '*I tried to throw a little light on the chronological data*' put me in the place of my friend who was in fact seeking to throw light on the chronological data of life. This deprives the sentence of its significance as a judgement protesting against the absurdity of the preceding sentences. The interpolated phrase, '*which seemed to me improbable*', belonged with the subsequent one, '*It seemed to be a plausible notion*'. I had used almost these precise words to the lady who had told her brother's case-history. '*It seems to me an improbable notion*' that his cries of "Nature! Nature!" had anything to do with Goethe; *it seems to me far more plausible* that the words had the sexual meaning you are familiar with.' It is true that here a judgement was passed - not in the dream, however, but in reality, and on an occasion which was recollected and exploited by the dream-thoughts. The content of the dream took over this judgement just like any other fragment of the dream-thoughts. The number '18' to which the judgement in the dream was senselessly attached, retains a trace of the real context from which the judgement was torn. Lastly, '*I was not quite sure what year we were in*' was intended merely to carry further my identification with the paralytic patient in my examination of whom this point had really arisen.

The resolution of what are ostensibly acts of judgement in dreams may serve to remind us of the rules laid down at the beginning of this book for carrying out the work of interpretation: namely, that we should disregard the apparent coherence between a dream's constituents as an unessential illusion, and that we should trace back the origin of each of its elements on its own account. A dream is a conglomerate which, for purposes of investigation, must be broken up once more into fragments. On the other hand, however, it will be observed that a psychical force is at work in dreams which creates this apparent connectedness, which, that is to say, submits the material produced by the dream-work to a 'secondary revision'. This brings us face to face with the manifestations of a force whose importance we shall later assess as the fourth of the factors concerned in the construction of dreams.

VI

Here is a further instance of a process of judgement at work in a dream that I have already recorded. In the absurd dream of the communication from the town council I asked: '*Did you get married soon after that?*' I calculated that, of course, I was born in 1856, which seemed to be the year which immediately followed the year in question. All of this was clothed in the form of a set of logical conclusions. My father had married in 1851, immediately after his attack; I, of course, was the eldest of the family and had been born in 1856; Q.E.D. As we know, this false conclusion was drawn in the interests of wish-fulfilment; and the predominant dream-thought ran: '*Four or five years; that's no time at all; it doesn't count.*' Every step in this set of logical conclusions, however alike in their content and their form, could be explained in another way as having been determined by the dream-thoughts. It was the *patient*, of whose long analysis my colleague had fallen foul, who had decided to get married immediately the treatment was finished. The manner of my interview with my father in the dream was like an interrogation or examination, and reminded me too of a teacher at the University who used to take down exhaustive particulars from the students who were enrolling themselves for his lectures: 'Date of birth?' - '1856.' - '*Patre?*' In reply to this, one gave one's father's first name with a Latin termination; and we students assumed that the Hofrat *drew conclusions* from the first name of the father which could not always be drawn from that of the student himself. Thus the *drawing of the conclusion* in the dream was no more than a repetition of the *drawing of a conclusion* which appeared as a piece of the material of the dream-thoughts. Something new emerges from this. If a conclusion appears in the content of the dream there is no question that it is derived from the dream-thoughts; but it may either be present in these as a piece of recollected material or it may link a series of dream-thoughts together in a logical chain. In any case, however, a conclusion in a dream represents a conclusion in the dream-thoughts.¹

At this point we may resume our analysis of the dream. The interrogation by the professor led to a recollection of the register of University Students (which in my time was drawn up in Latin). It led further to thoughts upon the course of my academic studies. The *five years* which are prescribed for medical studies were once again too few for me. I quietly went on with my work for several more years; and in my circle of acquaintances I was regarded as an idler and it was doubted whether I should ever get through. Thereupon I *quickly* decided to take my examinations and I got through them *in spite of the delay*. Here was a fresh reinforcement of the dream-thoughts with which I was defiantly confronting my critics: 'Even though you won't believe it because I've taken my time, I *shall* get through: I *shall* bring my medical training to a *conclusion*. Things have often turned out like that before.'

¹ These findings are in some respects a correction of what I have said above (p. 783) on the representation of logical relations in dreams. This earlier passage describes the general behaviour of the dream-work but takes no account of the finer and more precise details of its functioning.

This same dream in its opening passage contained some sentences which could hardly be refused the name of an argument. This argument was not even absurd; it might just as well have occurred in waking thought: *I was amused in the dream at the communication from the town council since, in the first place, I was not yet in the world in 1851 and, in the second place, my father, to whom it might have related, was already dead.* Both of these statements were not only correct in themselves but agreed precisely with the real arguments that I should bring up if I were actually to receive a communication of that kind. My earlier analysis of the dream showed that it grew out of deeply embittered and derisive dream-thoughts. If we may also assume that there were strong reasons present for the activity of the censorship, we shall understand that the dream-work had every motive for producing a *perfectly valid refutation of an absurd suggestion* on the model contained in the dream-thoughts. The analysis showed, however, that the dream-work did not have a free hand in framing this parallel but was obliged, for that purpose, to use material from the dream-thoughts. It was just as though there were an algebraic equation containing (in addition to numerals) plus and minus signs, indices and radical signs, and as though someone were to copy out the equation without understanding it, taking over both the operational symbols and the numerals into his copy but mixing them all up together. The two arguments could be traced back to the following material. It was distressing to me to think that some of the premises which underlay my psychological explanations of the psychoneuroses were bound to excite scepticism and laughter when they were first met with. For instance, I had been driven to assume that impressions from the second year of life, and sometimes even from the first, left a lasting trace on the emotional life of those who were later to fall ill, and that these impressions - though distorted and exaggerated in many ways by the memory - might constitute the first and deepest foundation for hysterical symptoms. Patients, to whom I explained this at some appropriate moment, used to parody this newly gained knowledge by declaring that they were ready to look for recollections dating from a time *at which they were not yet alive*. My discovery of the unexpected part played by their *father* in the earliest sexual impulses of female patients might well be expected to meet with a similar reception (see the discussion on p. 736 f.). Nevertheless, it was my well-grounded conviction that both of these hypotheses were true. By way of confirmation I called to mind some instances in which the death of the father occurred while the child was at a very early age and in which later events, otherwise inexplicable, proved that the child had nevertheless retained unconsciously recollections of the figure which had disappeared so early in his life. I was aware that these two assertions of mine rested on *the drawing of conclusions* whose validity would be disputed. It was therefore an achievement of wish-fulfilment when the material of precisely *those conclusions which I was afraid would be contested* was employed by the dream-work for drawing *conclusions which it was impossible to contest*.

VII

At the beginning of a dream, which I have so far hardly touched upon, there was a clear expression of astonishment at the subject which had cropped up. *Old Brücke must have set me some task; STRANGELY ENOUGH, it related to a dissection of the lower part of my own body, my pelvis and legs which I saw before me as though in the dissecting-room, but without noticing their absence in myself and also without a trace of any gruesome feeling. Louise N. was standing beside me and doing the work with me. The pelvis had been eviscerated, and it was visible now in its superior, now in its inferior, aspect, the two being mixed together. Thick flesh-coloured protuberances (which, in the dream itself, made me think of haemorrhoids) could be seen. Something which lay over it and was like crumpled silver-paper¹ had also to be carefully fished out. I was then once more in possession of my legs and was making my way through the town. But (being tired) I took a cab. To my astonishment the cab drove in through the door of a house, which opened and allowed it to pass along a passage which turned a corner at its end and finally led into the open air again.² Finally I was making a journey through a changing landscape with an Alpine guide who was carrying my belongings. Part of the way he carried me too, out of consideration for my tired legs. The ground was boggy; we went round the edge; people were sitting on the ground like Red Indians or gypsies - among them a girl. Before this I had been making my own way forward over the slippery ground with a constant feeling of surprise that I was able to do it so well after the dissection. As we reached a small wooden house at the end of which was an open window. There the guide set me down and laid two wooden boards, which were standing ready, upon the window-sill, so as to bridge the chasm which had to be crossed over from the window. At that point I really became frightened about my legs, but instead of the expected crossing, I saw two grown-up men lying on wooden benches that were along the walls of the hut, and what seemed to be two children sleeping beside them. It was as though what was going to make the crossing possible was not the boards but the children. I awoke in a mental fright.*

¹ Stanniol, which was an allusion to the book by Stannius on the nervous system of fishes. (Cf. loc. cit.)

² It was the place on the ground-floor of my block of flats where the tenants keep their perambulators; but it was over-determined in several other ways.

Anyone who has formed even the slightest idea of the extent of condensation in dreams will easily imagine what a number of pages would be filled by a full analysis of this dream. Fortunately, however, in the present context I need only take up one point in it, which provides an example of astonishment in dreams, as exhibited in the interpolation '*strangely enough*'. The following was the occasion of the dream. Louise N., the lady who was assisting me in my job in the dream, had been calling on me. 'Lend me something to read', she had said. I offered her Rider Haggard's *She*. 'A *strange* book, but full of hidden meaning', I began to explain to her; 'the eternal feminine, the immortality of our emotions . . .' Here she interrupted me: 'I know it already. Have you nothing of your own?' - 'No, my own immortal works have not yet been written.' - 'Well, when are we to expect these so-called ultimate explanations of yours which you've promised even *we* shall find readable?' she asked, with a touch of sarcasm. At that point I saw that someone else was admonishing me through her mouth and I was silent. I reflected on the amount of self-discipline it was costing me to offer the public even my book upon dreams - I should have to give away so much of my own private character in it.

Das Beste was du wissen kannst,
Darfst du den Buben doch nicht sagen.

The task which was imposed on me in the dream of carrying out a dissection of *my own body* was thus my *self-analysis* which was linked up with my giving an account of my dreams. Old Brücke came in here appropriately; even in the first years of my scientific work it happened that I allowed a discovery of mine to lie fallow until an energetic remonstrance on his part drove me into publishing it. The further thoughts which were started up by my conversation with Louise N. went too deep to become conscious. They were diverted in the direction of the material that had been stirred up in me by the mention of Rider Haggard's *She*. The judgement '*strangely enough*' went back to that book and to another one, *Heart of the World*, by the same author; and numerous elements of the dream were derived from these two imaginative novels. The boggy ground over which people had to be carried, and the chasm which they had to cross by means of boards brought along with them, were taken from *She*; the Red Indians, the girl and the wooden house were taken from *Heart of the World*. In both novels the guide is a woman; both are concerned with perilous journeys; while *She* describes an adventurous road that had scarcely ever been trodden before, leading into an undiscovered region. The tired feeling in my legs, according to a note which I find I made upon the dream, had been a real sensation during the day-time. It probably went along with a tired mood and a doubting thought: 'How much longer will my legs carry me?' The end of the adventure in *She* is that the guide, instead of finding immortality for herself and the others, perishes in the mysterious subterranean fire. A fear of that kind was unmistakably active in the dream-thoughts. The 'wooden house' was also, no doubt, a coffin, that is to say, the grave. But the dream-work achieved a masterpiece in its representation of this most unwished-for of all thoughts by a wish-fulfilment. For I had already been in a grave once, but it was an excavated Etruscan grave near Orvieto, a narrow chamber with two stone benches along its walls, on which the skeletons of two grown-up men were lying. The inside of the wooden house in the dream looked exactly like it, except that the stone was replaced by wood. The dream seems to have been saying: 'If you must rest in a grave, let it be the Etruscan one.' And, by making this replacement, it transformed the gloomiest of expectations into one that was highly desirable. Unluckily, as we are soon to hear, a dream can turn into its opposite the *idea* accompanying an affect but not always the affect itself. Accordingly, I woke up in a '*mental fright*', even after the successful emergence of the idea that children may perhaps achieve what their father has failed to - a fresh allusion to the strange novel in which a person's identity is retained through a series of generations for over two thousand years.

VIII

Included in yet another of my dreams there was an expression of surprise at something I had experienced in it; but the surprise was accompanied by such a striking, far-fetched and almost brilliant attempt at an explanation that, if only on *its* account, I cannot resist submitting the whole dream to analysis, quite apart from the dream's possessing two other points to attract our interest. I was travelling along the *Südbahn* railway line during the night of July 18-19th, and in my sleep I heard: '*Hollthurn, ten minutes*' being called out. *I at once thought of holothurians - of a natural history museum - that this was the spot at which valliant men had fought in vain against the superior power of the ruler of their country - yes, the Counter-Reformation in Austria - it was as though it were a place in Styria or the Tyrol. I then saw indistinctly a small museum, in which the relics or belongings of these men were preserved. I should have liked to get out, but hesitated to do so. There were women with fruit on the platform. They were crouching on the ground and holding up their baskets invitingly. - I hesitated because I was not sure whether there was time, but we were still not moving. - I was suddenly in another compartment, in which the upholstery and seats were so narrow that one's back pressed directly against the back of the carriage.*¹ *I was surprised by this, but I reflected that I MIGHT HAVE CHANGED CARRIAGES WHILE I WAS IN A SLEEPING STATE. There were several people, including an English brother and sister; a row of books were distinctly visible on a shelf on the wall. I saw 'The Wealth of Nations' and 'Matter and Motion' (by Clerk-Maxwell), a thick volume and bound in brown cloth. The man asked his sister about a book by Schiller, whether she had forgotten it. It seemed as though the books were sometimes mine and sometimes theirs. I felt inclined at that point to intervene in the conversation in a confirmatory or substantiating sense. . . . I woke up perspiring all over because all the windows were shut. The train was drawn up at Marburg.*

While I was writing the dream down a new piece of it occurred to me, which my memory had tried to pass over. *I said to the brother and sister, referring to a 'articular work: 'It is from . . .', but corrected myself: 'It is by . . . 'Yes', the man commented to his sister',he said that right.'*

¹ This description was unintelligible even to myself; but I have followed the fundamental rule of reporting a dream in the words which occurred to me as I was writing it down. The wording chosen is itself part of what is represented by the dream.

The dream opened with the name of the station, which must no doubt have partly woken me up. I replaced its name, *Marburg*, by *Hollthurn*. The fact that I heard 'Marburg' when it was first called out, or perhaps later, was proved by the mentioning in the dream of Schiller, who was born at Marburg, though not at the one in Styria.¹ I was making my journey on that occasion, although I was travelling first class, under very uncomfortable conditions. The train was packed full, and in my compartment I had found a lady and gentleman who appeared to be very aristocratic and had not the civility, or did not think it worth the trouble, to make any disguise of their annoyance at my intrusion. My polite greeting met with no response. Although the man and his wife were sitting side by side (with their backs to the engine) the woman nevertheless made haste, under my very eyes, to engage the window-seat facing her by putting an umbrella on it. The door was shut immediately, and pointed remarks were exchanged between them on the subject of opening windows. They had probably seen at once that I was longing for some fresh air. It was a hot night and the atmosphere in the completely closed compartment soon became suffocating. My experiences of travelling have taught me that conduct of this ruthless and overbearing kind is a characteristic of people who are travelling on a free or half-price ticket. When the ticket-collector came and I showed him the ticket I had bought at such expense, there fell from the lady's mouth, in haughty and almost menacing tones, the words: 'My husband has a free pass.' She was an imposing figure with discontented features, of an age not far from the time of the decay of feminine beauty; the man uttered not a word but sat there motionless. I attempted to sleep. In my dream I took fearful vengeance on my disagreeable companions; no one could suspect what insults and humiliations lay concealed behind the broken fragments of the first half of the dream. When this need had been satisfied a second wish made itself felt - to change compartments. The scene is changed so often in dreams, and without the slightest objection being raised, that it would not have been in the least surprising if I had promptly replaced my travelling companions by more agreeable ones derived from my memory. But here was a case in which something resented the change of scene and thought it necessary to explain it. How did I suddenly come to be in another compartment? I had no recollection of having changed. There could be only one explanation: *I must have left the carriage while I was in a sleeping state* - a rare event, of which, however, examples are to be found in the experience of a neuropathologist. We know of people who have gone upon railway journeys in a twilight state, without betraying their abnormal condition by any signs, till at some point in the journey they have suddenly come to themselves completely and been amazed at the gap in their memory. In the dream itself, accordingly, I was declaring myself to be one of these cases of '*automotisme ambulateur*'.

¹ [Footnote added 1909:] Schiller was not born at any Marburg, but at Marbach, as every German school-boy knows, and as I knew myself. This was one more of those mistakes (see above, [p. 681 n.](#)) which slip in as a substitute for an intentional falsification at some other point, and which I have tried to explain in my *Psychopathology of Everyday Life*.

Analysis made it possible to find another solution. The attempt at an explanation, which seemed so striking when I was obliged to ascribe it to the dream-work, was not an original one of my own, but was copied from the neurosis of one of my patients. I have already spoken elsewhere of a highly educated and, in real life, soft-hearted man who, shortly after the death of his parents, began to reproach himself with having murderous inclinations, and then fell a victim to the precautionary measures which he was obliged to adopt as a safeguard. It was a case of severe obsessions accompanied by complete insight. To begin with, walking through the streets was made a burden to him by a compulsion to make certain where every single person he met disappeared to; if anyone suddenly escaped his watchful eye, he was left with a distressing feeling and the idea that he might possibly have got rid of him. What lay behind this was, among other things, a 'Cain' phantasy - for 'all men are brothers.' Owing to the impossibility of carrying out this task, he gave up going for walks and spent his life incarcerated between his own four walls. But reports of murders which had been committed outside were constantly being brought into his room by the newspapers, and his conscience suggested to him, in the form of a doubt, that he might be the wanted murderer. The certainty that he had in fact not left his house for weeks protected him from these charges for a while, till one day the possibility came into his head that *he might have left his house while he was in an unconscious state* and have thus been able to commit the murder without knowing anything about it. From that time onwards he locked the front door of the house and gave the key to his old housekeeper with strict instructions never to let it fall into his hands even if he asked for it.

This, then, was the origin of my attempted explanation to the effect that I had changed carriages while I was in an unconscious state; it had been carried over ready-made into the dream from the material of the dream-thoughts, and was evidently intended in the dream to serve the purpose of identifying me with the figure of this patient. My recollection of him had been aroused by an easy association. My last night-journey, a few weeks earlier, had been made in the company of this very man. He was cured, and was travelling with me into the provinces to visit his relatives, who had sent for me. We had a compartment to ourselves; we left all the windows open all through the night and had a most entertaining time for as long as I stayed awake. I knew that the root of his illness had been hostile impulses against his father, dating from his childhood and involving a sexual situation. In so far, therefore, as I was identifying myself with him, I was seeking to confess to something analogous. And in fact the second scene of the dream ended in a somewhat extravagant phantasy that my two elderly travelling companions had treated me in such a stand-offish way because my arrival had prevented the affectionate exchanges which they had planned for the night. This phantasy went back, however, to a scene of early childhood in which the child, probably driven by sexual curiosity, had forced his way into his parents' bedroom and been turned out of it by his father's orders.

It is unnecessary, I think, to accumulate further examples. They would merely serve to confirm what we have gathered from those I have already quoted - that an act of judgement in a dream is only a repetition of some prototype in the dream-thoughts. As a rule, the repetition is ill-applied and interpolated into an inappropriate context, but occasionally, as in our last instances, it is so neatly employed that to begin with it may give the impression of independent intellectual activity in the dream. From this point we might turn our attention to the psychical activity which, though it does not appear to accompany the construction of dreams invariably, yet, whenever it does so, is concerned to fuse together elements in a dream which are of disparate origin into a whole which shall make sense and be without contradiction. Before approaching that subject, however, we are under an urgent necessity to consider the expressions of affect which occur in dreams and to compare them with the affects which analysis uncovers in the dream-thoughts.

(H)

AFFECTS IN DREAMS

A shrewd observation made by Stricker has drawn our attention to the fact that the expression of affect in dreams cannot be dealt with in the same contemptuous fashion in which, after waking, we are accustomed to dismiss their *content*. 'If I am afraid of robbers in a dream, the robbers, it is true, are imaginary - but the fear is real.' And this is equally true if I feel *glad* in a dream. Our feeling tells us that an affect experienced in a dream is in no way inferior to one of equal intensity experienced in waking life; and dreams insist with greater energy upon their right to be included among our real mental experiences in respect to their affective than in respect to their ideational content. In our waking state, however, we cannot in fact include them in this way, because we cannot make any psychical assessment of an affect unless it is linked to a piece of ideational material. If the affect and the idea are incompatible in their character and intensity, our waking judgement is at a loss.

It has always been a matter for surprise that in dreams the ideational content is not accompanied by the affective consequences that we should regard as inevitable in waking thought. Strümpell declared that in dreams ideas are denuded of their psychical values. But there is no lack in dreams of instances of a contrary kind, where an intense expression of affect appears in connection with subject-matter which seems to provide no occasion for any such expression. In a dream I may be in a horrible, dangerous and disgusting situation without feeling any fear or repulsion; while another time, on the contrary, I may be terrified at something harmless and delighted at something childish.

This particular enigma of dream-life vanishes more suddenly, perhaps, and more completely than any other, as soon as we pass over from the manifest to the latent content of the dream. We need not bother about the enigma, since it no longer exists. Analysis shows us that *the ideational content has undergone displacements and substitutions, whereas the affects have remained unaltered*. It is small wonder that the ideational material, which has been changed by dream-distortion, should no longer be compatible with the affect, which is retained unmodified; nor is there anything left to be surprised at after analysis has put the right material back into its former position.¹

In the case of a psychical complex which has come under the influence of the censorship imposed by resistance, the *affects* are the constituent which is least influenced and which alone can give us a pointer as to how we should fill in the missing thoughts. This is seen even more clearly in the psychoneuroses than in dreams. Their affects are always appropriate, at least in their *quality* though we must allow for their intensity being increased owing to displacements of neurotic attention. If a hysteric is surprised at having to be so frightened of something trivial or if a man suffering from obsessions is surprised at such distressing self-reproaches arising out of a mere nothing, they have both gone astray, because they regard the ideational content - the triviality or the mere nothing - as what is essential; and they put up an unsuccessful fight because they take this ideational content as the starting-point of their thought-activity. Psycho-analysis can put them upon the right path by recognizing the affect as being, on the contrary, justified and by seeking out the idea which belongs to it but has been repressed and replaced by a substitute. A necessary premise to all this is that the release of affect and the ideational content do not constitute the indissoluble organic unity as which we are in the habit of treating them, but that these two separate entities may be merely *soldered* together and can thus be detached from each other by analysis. Dream-interpretation shows that this is in fact the case.

¹ [Footnote added 1919:] If I am not greatly mistaken, the first dream that I was able to pick up from my grandson, at the age of one year and eight months, revealed a state of affairs in which the dream-work had succeeded in transforming the *material* of the dream-thoughts into a wish-fulfilment, whereas the *affect* belonging to them persisted unchanged during the state of sleep. On the night before the day on which his father was due to leave for the front, the child cried out, sobbing violently: 'Daddy! Daddy! - baby!' This can only have meant that Daddy and baby were remaining together; whereas the tears recognized the approaching farewell. At that time the child was already quite well able to express the concept of separation. 'Forl' ['gone'] (replaced by a long-drawn-out and peculiarly stressed 'o-o-o') had been one of his first words, and several months before this first dream he had played at 'gone' with all his toys. This game went back to a successful piece of self-discipline which he had achieved at an early age in allowing his mother to leave him and be 'gone.'

I shall begin by giving an example in which analysis explained the apparent absence of affect in a case where the ideational content should have necessitated its release.

I

She saw three lions in a desert, one of which was laughing; but she was not afraid of them. Afterwards, however, she must have run away from them, for she was trying to climb up a tree; but she found that her cousin, who was a French mistress, was up there already, etc.

The analysis brought up the following material. The indifferent precipitating cause of the dream was a sentence in her English composition: 'The mane is the ornament of the lion.' Her father wore a beard which framed his face like a mane. Her English mistress was called Miss Lyons. An acquaintance had sent her the ballads of Loewe. These, then, were the three lions; why should she be afraid of them? - She had read a story in which a negro, who had stirred up his companions to revolt, was hunted with blood hounds and climbed up a tree to save himself. She went on, in the highest spirits, to produce a number of fragmentary recollections, such as the advice on how to catch lions from *Fliegende Blätter*: 'Take a desert and put it through a sieve and the lions will be left over.' And again, the highly amusing but not very proper anecdote of an official who was asked why he did not take more trouble to ingratiate himself with the head of his department and replied that he had tried to make his way in, but his superior *was up there already*. The whole material became intelligible when it turned out that the lady had had a visit on the dream-day from her husband's superior. He had been very polite to her and had kissed her hand and *she had not been in the least bit afraid of him*, although he was a very 'big bug', and played the part of a 'social lion' in the capital of the country she came from. So this lion was like the lion in *A Midsummer Night's Dream* that concealed the figure of Snug the joiner; and the same is true of all dream-lions of which the dreamer is not afraid.

II

As my second example I may quote the dream of the young girl who saw her sister's little son lying dead in his coffin, but who, as I may now add, felt neither pain nor grief. We know from the analysis why this was. The dream merely disguised her wish to see the man she was in love with once more; and her affect had to be in tune with her wish and not with its disguise. There was thus no occasion for grief.

In some dreams the affect does at least remain in contact with the ideational material which has replaced that to which the affect was originally attached. In others, the dissolution of the complex has gone further. The affect makes its appearance completely detached from the idea which belongs to it and is introduced at some other point in the dream, where it fits in with the new arrangement of the dream-elements. The situation is then similar to the one we have found in the case of acts of judgement in dreams. If an important conclusion is drawn in the dream-thoughts, the dream also contains one; but the conclusion in the dream may be displaced on to quite different material. Such a displacement not infrequently follows the principle of antithesis.

This last possibility is exemplified in the following dream, which I have submitted to a most exhaustive analysis.

III

A castle by the sea; later it was no longer immediately on the sea, but on a narrow canal leading to the sea. The Governor was a Herr P. I was standing with him in a big reception room - with three windows in front of which there rose buttresses with what looked like crenellations. I had been attached to the garrison as something in the nature of a volunteer naval officer. We feared the arrival of enemy warships, since we were in a state of war. Herr P. intended to leave, and gave me instructions as to what was to be done if the event that we feared took place. His invalid wife was with their children in the threatened castle. If the bombardment began, the great hall was to be evacuated. He breathed heavily and turned to go; I held him back and asked him how I was to communicate with him in case of necessity. He added something in reply, but immediately fell down dead. No doubt I had put an unnecessary strain upon him with my questions. After his death, which made no further impression on me, I wondered whether his widow would remain in the castle, whether I should report his death to the Higher Command and whether I should take over command of the castle as being next in order of rank. I was standing at the window, and observing the ships as they went past. They were merchant vessels rushing past rapidly through the dark water, some of them with several funnels and others with bulging decks (just like the station buildings in the introductory dream - not reported here). Then my brother was standing beside me and we were both looking out of the window at the canal. At the sight of one ship we were frightened and cried out: 'Here comes the warship!' But it turned out that it was only the same ships that I already knew returning. There now came a small ship, cut off short, in a comic fashion, in the middle. On its deck some curious cup-shaped or box-shaped objects were visible. We called out with one voice: 'That's the breakfast-ship!'

The rapid movements of the ships, the deep dark blue of the water and the brown smoke from the funnels - all of this combined to create a tense and sinister impression.

The localities in the dream were brought together from several trips of mine to the Adriatic (to Miramare, Duino, Venice and Aquileia). A short but enjoyable Easter trip which I had made to Aquileia with my brother a few weeks before the dream was still fresh in my memory. The dream also contained allusions to the *maritime war* between America and Spain and to anxieties to which it had given rise about the fate of my relatives in America. At two points in the dream affects were in question. At one point an affect that was to be anticipated was absent: attention was expressly drawn to the fact that the Governor's death made no impression on me. At another point, when I thought I saw the warship, I was *frightened* and felt all the sensations of fright in my sleep. In this well-constructed dream the affects were distributed in such a way that any striking contradiction was avoided. There was no reason why I should be frightened at the death of the Governor and it was quite reasonable that as Commandant of the Castle I should be frightened at the sight of the warship. The analysis showed, however, that Herr P. was only a substitute for my own self. (In the dream *I* was the substitute for *him*.) *I* was the Governor who suddenly died. The dream-thoughts dealt with the future of my family after my premature death. This was the only distressing one among the dream-thoughts; and it must have been from it that the fright was detached and brought into connection in the dream with the sight of the warship. On the other hand, the analysis showed that the region of the dream-thoughts from which the warship was taken was filled with the most cheerful recollections. It was a year earlier, in Venice, and we were standing one magically beautiful day at the windows of our room on the Riva degli Schiavoni and were looking across the blue lagoon on which that day there was more movement than usual. English ships were expected and were to be given a ceremonial reception. Suddenly my wife cried out gaily as a child: '*Here comes the English warship!*' In the dream I was frightened at these same words. (We see once again that speeches in a dream are derived from speeches in real life; I shall show shortly that the element 'English' in my wife's exclamation did not elude the dream-work either.) Here, then, in the process of changing the dream-thoughts into the manifest dream-content, I have transformed cheerfulness into fear, and I need only hint that this transformation was itself giving expression to a portion of the latent dream-content. This example proves, however, that the dream-work is at liberty to detach an affect from its connections in the dream-thoughts and introduce it at any other point it chooses in the manifest dream.

I take this opportunity of making a somewhat detailed analysis of the 'breakfast-ship', the appearance of which in the dream brought such a nonsensical conclusion to a situation which had up to then been kept at a rational level. When subsequently I called the dream-object more precisely to mind, it struck me that it was black and that, owing to the fact that it was cut off short where it was broadest in the middle, it bore a great resemblance at that end to a class of objects which had attracted our interest in the museums in the Etruscan towns. These were rectangular trays of black pottery, with two handles, on which there stood things like coffee- or tea-cups, not altogether unlike one of our modern *breakfast-sets*. In response to our enquiries we learned that this was the '*toilette*' [toilet-set] of an Etruscan lady, with receptacles for cosmetics and powder on it, and we had jokingly remarked that it would be a good idea to take one home with us for the lady of the house. The object in the dream meant, accordingly, a black 'toilette', i.e. mourning dress, and made a direct reference to a death. The other end of the dream-object reminded me of the funeral boats¹ in which in early times dead bodies were placed and committed to the sea for burial. This led on to the point which explained why the ships *returned* in the dream:

Still, auf gerettetem Boot, treibt in den Hafen der Greis.²

It was the return after a shipwreck ['*Schiffbruch*', literally 'ship-break'] - the breakfast-ship was broken off short in the middle. But what was the origin of the name 'breakfast'-ship? It was here that the word 'English' came in, which was left over from the warships. The English word 'breakfast' means 'breaking fast'. The 'breaking' related once more to the shipwreck ['ship-break'] and the fasting was connected with the black dress or *toilette*.

But it was only the *name* of the breakfast-ship that was newly constructed by the dream. The *thing* had existed and reminded me of one of the most enjoyable parts of my last trip. Mistrusting the food that would be provided at Aquileia, we had brought provisions with us from Gorizia and had bought a bottle of excellent Istrian wine at Aquileia. And while the little mail steamer made its way slowly through the '*Canale delle Mee*' across the empty lagoon to Grado we, who were the only passengers, ate our breakfast on deck in the highest spirits, and we had rarely tasted a better one. This, then, was the 'breakfast-ship', and it was precisely behind this memory of the most cheerful *joie de vivre* that the dream concealed the gloomiest thoughts of an unknown and uncanny future.

¹ '*Nachen*' [in German], a word which is derived, as a philological friend tells me, from the root '*νεχνε*' [corpse].

² [Safe on his ship, the old man quietly sails into port.]

The detachment of affects from the ideational material which generated them is the most striking thing which occurs to them during the formation of dreams; but it is neither the only nor the most essential alteration undergone by them on their path from the dream-thoughts to the manifest dream. If we compare the affects of the dream-thoughts with those in the dream, one thing at once becomes clear. Whenever there is an affect in the dream, it is also to be found in the dream-thoughts. But the reverse is not true. A dream is in general poorer in affect than the psychical material from the manipulation of which it has proceeded. When I have reconstructed the dream-thoughts, I habitually find the most intense psychical impulses in them striving to make themselves felt and struggling as a rule against others that are sharply opposed to them. If I then turn back to the dream, it not infrequently appears colourless, and without emotional tone of any great intensity. The dream-work has reduced to a level of indifference not only the content but often the emotional tone of my thoughts as well. It might be said that the dream-work brings about a *suppression of affects*. Let us, for instance, take the dream of the botanical monograph. The thoughts corresponding to it consisted of a passionately agitated plea on behalf of my liberty to act as I chose to act and to govern my life as seemed right to me and me alone. The dream that arose from them has an indifferent ring about it: 'I had written a monograph; it lay before me; it contained coloured plates; dried plants accompanied each copy.' This reminds one of the peace that has descended upon a battle field strewn with corpses; no trace is left of the struggle which raged over it.

Things can be otherwise: lively manifestations of affect can make their way into the dream itself. For the moment, however, I will dwell upon the incontestable fact that large numbers of dreams appear to be indifferent, whereas it is never possible to enter into the dream-thoughts without being deeply moved.

No complete theoretical explanation can here be given of this suppression of affect in the course of the dream-work. It would require to be preceded by a most painstaking investigation of the theory of affects and of the mechanism of repression. I will only permit myself a reference to two points. I am compelled - for other reasons - to picture the release of affects as a centrifugal process directed towards the interior of the body and analogous to the processes of motor and secretory innervation. Now just as in the state of sleep the sending out of motor impulses towards the external world appears to be suspended, so it may be that the centrifugal calling-up of affects by unconscious thinking may become more difficult during sleep. In that case the affective impulses occurring during the course of the dream-thoughts would from their very nature be weak impulses, and consequently those which found their way into the dream would be no less weak. On this view, then, the 'suppression of affect' would not in any way be the consequence of the dream-work but would result from the state of sleep. This may be true, but it cannot be the whole truth. We must also bear in mind that any relatively complex dream turns out to be a compromise produced by a conflict between psychical forces. For one thing, the thoughts constructing the wish are obliged to struggle against the opposition of a censoring agency; and for another thing, we have often seen that in unconscious thinking itself every train of thought is yoked with its contradictory opposite. Since all of these trains of thought are capable of carrying an affect, we shall by and large scarcely be wrong if we regard the suppression of affect as a consequence of the inhibition which these contraries exercise upon each other and which the censorship exercises upon the impulsions suppressed by it. *The inhibition of affect, accordingly, must be considered as the second consequence of the censorship of dreams, just as dream-distortion is its first consequence.*

I will here give as an instance a dream in which the indifferent feeling-tone of the content of the dream can be explained by the antithesis between the dream-thoughts. It is a short dream, which will fill every reader with disgust.

IV

A hill, on which there was something like an open-air closet: a very long seat with a large hole at the end of it. Its back edge was thickly covered with small heaps of faeces of all sizes and degrees of freshness. There were bushes behind the seat. I micturated on the seat; a long stream of urine washed everything clean; the lumps of faeces came away easily and fell into the opening. It was as though at the end there was still some left.

Why did I feel no disgust during this dream?

Because, as the analysis showed, the most agreeable and satisfying thoughts contributed to bringing the dream about. What at once occurred to me in the analysis were the Augean stables which were cleansed by Hercules. This Hercules was I. The hill and bushes came from Aussee, where my children were stopping at the time. I had discovered the infantile aetiology of the neuroses and had thus saved my own children from falling ill. The seat (except, of course, for the hole) was an exact copy of a piece of furniture which had been given to me as a present by a grateful woman patient. It thus reminded me of how much my patients honoured me. Indeed, even the museum of human excrement could be given an interpretation to rejoice my heart. However much I might be disgusted by it in reality, in the dream it was a reminiscence of the fair land of Italy where, as we all know, the W.C.s in the small towns are furnished in precisely this way. The stream of urine which washed everything clean was an unmistakable sign of greatness. It was in that way that Gulliver extinguished the great fire in Lilliput though incidentally this brought him into disfavour with its tiny queen. But Gargantua, too, Rabelais' superman, revenged himself in the same way on the Parisians by sitting astride on Notre Dame and turning his stream of urine upon the city. It was only on the previous evening before going to sleep that I had been turning over Garnier's illustrations to Rabelais. And, strangely enough, here was another piece of evidence that I was the superman. The platform of Notre Dame was my favourite resort in Paris; every free afternoon I used to clamber about there on the towers of the church between the monsters and the devils. The fact that all the faeces disappeared so quickly under the stream recalled the motto: '*Afflavit et dissipati sunt*', which I intended one day to put at the head of a chapter upon the therapy of hysteria.

And now for the true exciting cause of the dream. It had been a hot summer afternoon; and during the evening I had delivered my lecture on the connection between hysteria and the perversions, and everything I had had to say displeased me intensely and seemed to me completely devoid of any value. I was tired and felt no trace of enjoyment in my difficult work; I longed to be away from all this grubbing about in human dirt and to be able to join my children and afterwards visit the beauties of Italy. In this mood I went from the lecture room to a café, where I had a modest snack in the open air, since I had no appetite for food. One of my audience, however, went with me and he begged leave to sit by me while I drank my coffee and choked over my crescent roll. He began to flatter me: telling me how much he had learnt from me, how he looked at everything now with fresh eyes, how I had cleansed the *Augean stables* of errors and prejudices in my theory of the neuroses. He told me, in short, that I was a very great man. My mood fitted ill with this paeon of praise; I fought against my feeling of disgust, went home early to escape from him, and before going to sleep turned over the pages of Rabelais and read one of Conrad Ferdinand Meyer's short stories, '*Die Leiden eines Knaben*' ['A Boy's Sorrows'].

Such was the material out of which the dream emerged. Meyer's short story brought up in addition a recollection of scenes from my childhood. (Cf. the last episode in the dream about Count Thun.) The day-time mood of revulsion and disgust persisted into the dream in so far as it was able to provide almost the entire material of its manifest content. But during the night a contrary mood of powerful and even exaggerated self-assertiveness arose and displaced the former one. The content of the dream had to find a form which would enable it to express both the delusions of inferiority and the megalomania in the same material. The compromise between them produced an ambiguous dream-content; but it also resulted in an indifferent feeling-tone owing to the mutual inhibition of these contrary impulses.

According to the theory of wish-fulfilment, this dream would not have become possible if the antithetical megalomaniac train of thought (which, it is true, was suppressed, but had a pleasurable tone) had not emerged in addition to the feeling of disgust. For what is distressing may not be represented in a dream; nothing in our dream-thoughts which is distressing can force an entry into a dream unless it at the same time lends a disguise to the fulfilment of a wish.

There is yet another alternative way in which the dream-work can deal with affects in the dream-thoughts, in addition to allowing them through or reducing them to nothing. It can *turn them into their opposite*. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: 'dream books' very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like my other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish-fulfilment, for wish-fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the *affects* attaching to dream-thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream-censorship. In social life, which has provided us with our familiar analogy with the dream-censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my *affect* from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the *opposite* affect - smile when I am angry and seem affectionate when I wish to destroy.

We have already come across an excellent example of a reversal of affect of this kind carried out in a dream on behalf of the dream-censorship. In the dream of 'my uncle with the yellow beard' I felt the greatest affection for my friend R., whereas and because the dream-thoughts called him a simpleton. It was from this example of reversal of affect that we derived our first hint of the existence of a dream-censorship. Nor is it necessary to assume, in such cases either, that the dream-work *creates* contrary affects of this kind out of nothing; it finds them as a rule lying ready to hand in the material of the dream-thoughts, and merely intensifies them with the psychical force arising from a motive of defence, till they can predominate for the purposes of dream-formation. In the dream of my uncle which I have just mentioned, the antithetical, affectionate affect probably arose from an infantile source (as was suggested by the later part of the dream), for the uncle-nephew relationship, owing to the peculiar nature of the earliest experiences of my childhood (cf. the analysis on p. 876 f.) had become the source of all my friendships and all my hatreds.

An excellent example of a reversal of affect of this kind will be found in a dream recorded by Ferenczi (1916): 'An elderly gentleman was awakened one night by his wife, who had become alarmed because he was laughing so loudly and unrestrainedly in his sleep. Subsequently the man reported that he had had the following dream: *I was lying in bed and a gentleman who was known to me entered the room; I tried to turn on the light but was unable to: I tried over and over again, but in vain. Thereupon my wife got out of bed to help me, but she could not manage it either. But as she felt awkward in front of the gentleman owing to being "en négligé", she finally gave it up and went back to bed. All of this was so funny that I couldn't help roaring with laughter at it. My wife said, 'Why are you laughing? why are you laughing?' but I went on laughing till I woke up.* - Next day the gentleman was very depressed and had a headache: so much laughing had upset him, he thought.

'The dream seems less amusing when it is considered analytically. The "gentleman known to him" who entered the room was, in the latent dream-thoughts, the picture of Death as the "great Unknown" - a picture which had been called up in his mind during the previous day. The old gentleman, who suffered from arterio-sclerosis, had had good reason the day before for thinking of dying. The unrestrained laughter took the place of sobbing and weeping at the idea that he must die. It was the light of life that he could no longer turn on. This gloomy thought may have been connected with attempts at copulation which he had made shortly before but which had failed even with the help of his wife *en négligé*. He realized that he was already going down hill. The dream-work succeeded in transforming the gloomy idea of impotence and death into a comic scene, and his sobs into laughter.'

There is one class of dreams which have a particular claim to be described as 'hypocritical' and which offer a hard test to the theory of wish-fulfilment. My attention was drawn to them when Frau Dr. M. Hilferding brought up the following record of a dream of Peter Rosegger's for discussion by the Vienna Psycho-Analytical Society.

Rosegger writes in his story '*Fremd gemacht!*' [*'Dismissed!'*]¹ 'As a rule I am a sound sleeper but many a night I have lost my rest - for, along with my modest career as a student and man of letters, I have for many years dragged around with me, like a ghost from which I could not set myself free, the shadow of a tailor's life.

'It is not as though in the day-time I had reflected very often or very intensely on my past. One who had cast off the skin of a Philistine and was seeking to conquer Earth and Heaven had other things to do. Nor would I, when I was a dashing young fellow, have given more than a thought to my nightly dreams. Only later, when the habit had come to me of reflecting upon everything, or when the Philistine within me began to stir a trifle, did I ask myself why it should be that, if I dreamt at all, I was always a journeyman tailor and that I spent so long a time as such with my master and worked without pay in his workshop. I knew well enough, as I sat like that beside him, sewing and ironing, that my right place was no longer there and that as a townsman I had other things to occupy me. But I was always on vacation, I was always having summer holidays, and so it was that I sat beside my master as his assistant. It often irked me and I felt sad at the loss of time in which I might well have found better and more useful things to do. Now and then, when something went awry, I had to put up with a scolding from my master, though there was never any talk of wages. Often, as I sat there with bent back in the dark workshop, I thought of giving notice and taking my leave. Once I even did so; but my master paid no heed and I was soon sitting beside him again and sewing.

¹ In the second volume of *Waldheimat*, p. 303.

'After such tedious hours, what a joy it was to wake! And I determined that if this persistent dream should come again I would throw it from me with energy and call aloud: "This is mere hocus-pocus, I am lying in bed and want to sleep. . . ." But next night I was once more sitting in the tailor's workshop.

'And so it went on for years with uncanny regularity. Now it happened once that my master and I were working at Alpelhofer's (the peasant in whose house I had worked when I was first apprenticed) and my master showed himself quite especially dissatisfied with my work. "I'd like to know where you're wool-gathering," he said, and looked at me darkly. The most reasonable thing to do, I thought, would be to stand up and tell him that I was only with him to please him and then go off. But I did not do so. I made no objection when my master took on an apprentice and ordered me to make room for him on the bench. I moved into the corner and sewed. The same day another journeyman was taken on as well, a canting hypocrite - he was a Bohemian - who had worked at our place nineteen years before, and had fallen into the brook once on his way back from the inn. When he looked for a seat there was no more room. I turned to my master questioningly, and he said to me: "You've no gift for tailoring, you can go! you're dismissed!" My fright at this was so overpowering that I awoke.

'The grey light of morning was glimmering through the uncurtained windows into my familiar home. Works of art surrounded me; there in my handsome book-case stood the eternal Homer, the gigantic Dante, the incomparable Shakespeare, the glorious Goethe-all the magnificent immortals. From the next room rang out the clear young voices of the awakening children joking with their mother. I felt as though I had found afresh this idyllically sweet, this peaceful, poetic, spiritual life in which I had so often and so deeply felt a meditative human happiness. Yet it vexed me that I had not been beforehand with my master in giving him notice, but had been dismissed by him.

'And how astonished I was! From the night on which my master dismissed me, I enjoyed peace; I dreamt no more of the tailoring days which lay so far back in my past-days which had been so cheerfully unassuming but had thrown such a long shadow over my later years.'

In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his day-time existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word '*analysis*', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are '*psycho-analyses*'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a *parvenu*, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a *parvenu's* pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, *she* was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: 'Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young.'¹

¹ [Footnote added 1930:] Since psycho-analysis has divided the personality into an ego and a super-ego (Freud, 1921c), it has become easy to recognize in these punishment dreams fulfilments of the wishes of the super-ego.

Another group of dreams, which I have often come across in myself and recognized as hypocritical, have as their content a reconciliation with people with whom friendly relations have long since ceased. In such cases analysis habitually reveals some occasion which might urge me to abandon the last remnant of consideration for these former friends and to treat them as strangers or enemies. The dream, however, prefers to depict the opposite relationship.

In forming any judgement upon dreams recorded by an imaginative writer it is reasonable to suppose that he may have omitted from his account details in the content of the dream which he regards as unessential or distracting. His dreams will in that case raise problems which would be quickly solved if their content were reported in full.

Otto Rank has pointed out to me that the Grimms' fairy tale of 'The Little Tailor, or Seven at a Blow' contains an exactly similar dream of a *parvenu*. The tailor, who has become a hero and the son-in-law of the King, dreams one night of his former handicraft, as he lies beside his wife, the Princess. She, becoming suspicious, posts armed guards the next night to listen to the dreamer's words and to arrest him. But the little tailor is warned, and sees to it that his dream is corrected.

The complicated process of elimination, diminution and reversal, by means of which the affects in the dream-thoughts are eventually turned into those in the dream, can be satisfactorily followed in suitable syntheses of dreams that have been completely analysed. I will quote a few more examples of affects in dreams where some of the possibilities I have enumerated will be found realized.

V

If we turn back to the dream about the strange task set me by old Brücke of making a dissection of my own pelvis, it will be recalled that in the dream itself I missed the gruesome feeling [*'Grauen'*] appropriate to it. Now this was a wish-fulfilment in more than one sense. The dissection meant the self-analysis which I was carrying out, as it were, in the publication of this present book about dreams - a process which had been so distressing to me in reality that I had postponed the printing of the finished manuscript for more than a year. A wish then arose that I might get over this feeling of distaste; hence it was that I had no gruesome feeling [*'Grauen'*] in the dream. But I should also have been very glad to miss growing grey - '*Grauen*' in the other sense of the word. I was already growing quite grey, and the grey of my hair was another reminder that I must not delay any longer. And, as we have seen, the thought that I should have to leave it to my children to reach the goal of my difficult journey forced its way through to representation at the end of the dream.

Let us next consider the two dreams in which an expression of satisfaction was transposed to the moment after waking. In the one case the reason given for the satisfaction was an expectation that I should now discover what was meant by 'I've dreamt of that before', while the satisfaction really referred to the birth of my first children. In the other case the ostensible reason was my conviction that something that had been 'prognosticated' was now coming true, while the real reference was similar to that in the former dream: it was the satisfaction with which I greeted the birth of my second son. Here the affects which dominated the dream-thoughts persisted in the dreams; but it is safe to say that in *no* dream can things be as simple as all that. If we go a little more deeply into the two analyses we find that this satisfaction which had escaped censorship had received an accession from another source. This other source had grounds for fearing the censorship, and its affect would undoubtedly have aroused opposition if it had not covered itself by the similar, legitimate affect of satisfaction, arising from the permissible source, and slipped in, as it were, under its wing.

Unfortunately, I cannot demonstrate this in the actual case of these dreams, but an instance taken from another department of life will make my meaning clear. Let us suppose the following case. There is a person of my acquaintance whom I hate, so that I have a lively inclination to feel glad if anything goes wrong with him. But the moral side of my nature will not give way to this impulse. I do not dare to express a wish that he should be unlucky, and if he meets with some undeserved misfortune, I suppress my satisfaction at it and force myself to manifestations and thoughts of regret. Everyone must have found himself in this situation at some time or other. What now happens, however, is that the hated person, by a piece of misconduct of his own, involves himself in some well-deserved unpleasantness; when that happens, I may give free rein to my satisfaction that he has met with a just punishment and in this I find myself in agreement with many other people who are impartial. I may observe, however, that my satisfaction seems more intense than that of these other people; it has received an accession from the source of my hatred, which till then has been prevented from producing its affect, but in the altered circumstances is no longer hindered from doing so. In social life this occurs in general wherever antipathetic people or members of an unpopular minority put themselves in the wrong. Their punishment does not as a rule correspond to their wrongdoing but to their wrongdoings *plus* the ill-feeling directed against them which has previously been without any consequences. It is no doubt true that those who inflict the punishment are committing an injustice in this; but they are prevented from perceiving it by the satisfaction resulting from the removal of a suppression which has long been maintained within them. In cases such as this the affect is justified in its *quality* but not in its *quantity*, and self-criticism which is set at rest on the one point is only too apt to neglect examination of the second one. When once a door has been opened, it is easy for more people to push their way through it than there had originally been any intention of letting in.

A striking feature in neurotic characters - the fact that a cause capable of releasing an affect is apt to produce in them a result which is qualitatively justified but quantitatively excessive is to be explained along these same lines, in so far as it admits of any psychological explanation at all. The excess arises from sources of affect which had previously remained unconscious and suppressed. These sources have succeeded in setting up an associative link with the *real* releasing cause, and the desired path from the release of their own affect has been opened by the *other* source of affect, which is unobjectionable and legitimate. Our attention is thus drawn to the fact that in considering the suppressed and suppressing agencies, we must not regard their relation as being exclusively one of mutual inhibition. Just as much regard must be paid to cases in which the two agencies bring about a pathological effect by working side by side and by intensifying each other.

Let us now apply these hints upon psychical mechanisms to an understanding of the expressions of affect in *dreams*. A satisfaction which is exhibited in a dream and can, of course, be immediately referred to its proper place in the dream-thoughts is not always completely elucidated by this reference alone. It is as a rule necessary to look for *another* source of it in the dream-thoughts, a source which is under the pressure of the censorship. As a result of that pressure, this source would normally have produced, not satisfaction, but the contrary affect. Owing to the presence of the first source of affect, however, the second source is enabled to withdraw its affect of satisfaction from repression and allow it to act as an intensification of the satisfaction from the first source. Thus it appears that affects in dreams are fed from a confluence of several sources and are over-determined in their reference to the material of the dream-thoughts. *During the dream-work, sources of affect which are capable of producing the same affect come together in generating it.*¹

We can gain a little insight into these complications from the analysis of that fine specimen of a dream of which the words '*Non Vixit*' formed the centre-point. (See [p. 874 ff.](#)) In that dream manifestations of affect of various qualities were brought together at two points in its manifest content. Hostile and distressing feelings - 'overcome by strange emotions' were the words used in the dream itself - were piled up at the point at which I annihilated my opponent and friend with two words. And again, at the end of the dream, I was highly delighted, and I went on to approve the possibility, which in waking life I knew was absurd, of there being *revenants* who could be eliminated by a mere wish.

¹ [Footnote added 1909:] I have given an analogous explanation of the extraordinarily powerful pleasurable effect of tendentious jokes.

I have not yet related the exciting cause of the dream. It was of great importance and led deep into an understanding of the dream. I had heard from my friend in Berlin, whom I have referred to as 'Fl.', that he was about to undergo an operation and that I should get further news of his condition from some of his relatives in Vienna. The first reports I received after the operation were not reassuring and made me feel anxious. I should have much preferred to go to him myself, but just at that time I was the victim of a painful complaint which made movement of any kind a torture to me. The dream-thoughts now informed me that I feared for my friend's life. His only sister, whom I had never known, had, as I was aware, died in early youth after a very brief illness. (In the dream *Fl. spoke about his sister and said that in three quarters of an hour she was dead.*) I must have imagined that his constitution was not much more resistant than his sister's and that, after getting some much worse news of him, I should make the journey after all - and arrive *too late*, for which I might never cease to reproach myself.¹ This reproach for coming too late became the central point of the dream but was represented by a scene in which Brücke, the honoured teacher of my student years, levelled this reproach at me with a terrible look from his blue eyes. It will soon appear what it was that caused the situation to be switched on to these lines. The scene itself could not be reproduced by the dream in the form in which I experienced it. The other figure in the dream was allowed to keep the blue eyes, but the annihilating role was allotted to me - a reversal which was obviously the work of wish-fulfilment. My anxiety about my friend's recovery, my self-reproaches for not going to see him, the shame I felt about this - *he had come to Vienna* (to see me) '*unobtrusively*' - the need I felt to consider that I was excused by my illness - all of this combined to produce the emotional storm which was clearly perceived in my sleep and which raged in this region of the dream-thoughts.

¹ It was this phantasy, forming part of the unconscious dream-thoughts, which so insistently demanded '*Non vivit*' instead of '*Non vixit*': 'You have come too late, he is no longer alive'. I have already explained on [pp. 874-875](#) that '*Non vivit*' was also required by the *manifest* situation in the dream.

But there was something else in the exciting cause of the dream, which had a quite opposite effect upon me. Along with the unfavourable reports during the first few days after the operation, I was given a warning not to discuss the matter with anyone. I had felt offended by this because it implied an unnecessary distrust of my discretion. I was quite aware that these instructions had not emanated from my friend but were due to tactlessness or over-anxiety on the part of the intermediary, but I was very disagreeably affected by the veiled reproach because it was - not wholly without justification. As we all know, it is only reproaches which have something in them that 'stick'; it is only they that upset us. What I have in mind does not relate, it is true, to this friend, but to a much earlier period of my life. On that occasion I caused trouble between two friends (both of whom had chosen to honour me, too, with that name) by quite unnecessarily telling one of them, in the course of conversation, what the other had said about him. At that time, too, reproaches had been levelled at me, and they were still in my memory. One of the two friends concerned was Professor Fleischl; I may describe the other by his first name of 'Josef' - which was also that of P., my friend and opponent in the dream.

The reproach of being unable to keep anything to myself was attested in the dream by the element 'unobtrusive' and by Fl.'s question as to *how much I had told P. about his affairs*. But it was the intervention of this memory that transported the reproach against me for coming too late from the present time to the period at which I had worked in Brücke's laboratory. And, by turning the second person in the scene of annihilation in the dream into a Josef, I made the scene represent not only the reproach against me for coming too late but also the far more strongly repressed reproach that I was unable to keep a secret. Here the processes of condensation and displacement at work in the dream, as well as the reasons for them, are strikingly visible.

My present-day anger, which was only slight, over the warning I had been given not to give anything away received reinforcements from sources in the depth of my mind and thus swelled into a current of hostile feelings against persons of whom I was in reality fond. The source of this reinforcement flowed from my childhood. I have already shown how my warm friendships as well as my enmities with contemporaries went back to my relations in childhood with a nephew who was a year my senior; how he was my superior, how I early learned to defend myself against him, how we were inseparable friends, and how, according to the testimony of our elders, we sometimes fought with each other and - made complaints to them about each other. All my friends have in a certain sense been re-incarnations of this first figure who 'früh sich einst dem trüben Blick gezeigt'¹: they have been *revenants*. My nephew himself re-appeared in my boyhood, and at that time we acted the parts of Caesar and Brutus together. My emotional life has always insisted that I should have an intimate friend and a hated enemy. I have always been able to provide myself afresh with both, and it has not infrequently happened that the ideal situation of childhood has been so completely reproduced that friend and enemy have come together in a single individual - though not, of course, both at once or with constant oscillations, as may have been the case in my early childhood.

I do not propose at this point to discuss how it is that in such circumstances as these a recent occasion for the generation of an affect can hark back to an infantile situation and be replaced by that situation as far as the production of affect is concerned. This question forms part of the psychology of unconscious thinking, and would find its proper place in a psychological elucidation of the neuroses. For the purposes of dream-interpretation let us assume that a childhood memory arose, or was constructed in phantasy, with some such content as the following. The two children had a dispute about some object. (What the object was may be left an open question, though the memory or pseudo-memory had a quite specific one in view.) Each of them claimed to have *got there before the other* and therefore to have a better right to it. They came to blows and might prevailed over right. On the evidence of the dream, I may myself have been aware that I was in the wrong ('*I myself noticed the mistake*'). However, this time I was the stronger and remained in possession of the field. The vanquished party hurried to his grandfather - my father - and complained about me, and I defended myself in the words which I know from my father's account: 'I hit him 'cos he hit me.' This memory, or more probably phantasy, which came into my mind while I was analysing the dream - without further evidence I myself could not tell how - constituted an intermediate element in the dream-thoughts, which gathered up the emotions raging in them as a well collects the water that flows into it. From this point the dream-thoughts proceeded along some such lines as these: 'It serves you right if you had to make way for me. Why did you try to push *me* out of the way? I don't need you, I can easily find someone else to play with', and so on. These thoughts now entered upon the paths which led to their representation in the dream. There had been a time when I had had to reproach my friend Josef for an attitude of this same kind: '*Ote-toi que je m'y mette!*' He had followed in my footsteps as demonstrator in Brücke's laboratory, but promotion there was slow and tedious. Neither of Brücke's two assistants was inclined to budge from his place, and youth was impatient. My friend, who knew that he could not expect to live long, and whom no bonds of intimacy attached to his immediate superior, sometimes gave loud expression to his impatience, and, since this superior was seriously ill, P.'s wish to have him out of the way might have an uglier meaning than the mere hope for the man's promotion. Not unnaturally, a few years earlier, I myself had nourished a still livelier wish to fill a vacancy. Wherever there is rank and promotion the way lies open for wishes that call for suppression. Shakespeare's Prince Hal could not, even at his father's sick-bed, resist the temptation of trying on the crown. But, as was to be expected, the dream punished my friend, and not me, for this callous wish.²

'As he was ambitious, I slew him.' As he could not wait for the removal of another man, he was himself removed. These had been my thoughts immediately after I attended the unveiling at the University of the memorial - not to him but to the other man. Thus a part of the satisfaction I felt in the dream was to be interpreted: 'A just punishment! It serves you right!'

¹ ['... long since appeared before my troubled gaze']

² It will be noticed that the name Josef plays a great part in my dreams (cf. the dream about my uncle). My own ego finds it very easy to hide itself behind people of that name, since Joseph was the name of a man famous in the Bible as an interpreter of dreams.

At my friend's funeral, a young man had made what seemed to be an inopportune remark to the effect that the speaker who had delivered the funeral oration had implied that without this one man the world would come to an end. He was expressing the honest feelings of someone whose pain was being interfered with by an exaggeration. But this remark of his was the starting-point of the following dream-thoughts: 'It's quite true that no one's irreplaceable. How many people I've followed to the grave already! But I'm still alive. I've survived them all; I'm left in possession of the field.' A thought of this kind, occurring to me at a moment at which I was afraid might not find my friend alive if I made the journey to him, could only be construed as meaning that I was delighted because I had once more survived someone, because it was *he* and not I who had died, because I was left in possession of the field, as I had been in the phantasied scene from my childhood. This satisfaction, infantile in origin, at being in possession of the field constituted the major part of the affect that appeared in the dream. I was delighted to survive, and I gave expression to my delight with all the naïve egoism shown in the anecdote of the married couple one of whom said to the other: 'If one of us dies, I shall move to Paris.' So obvious was it to me that I should not be the one to die.

It cannot be denied that to interpret and report one's dreams demands a high degree of self-discipline. One is bound to emerge as the only villain among the crowd of noble characters who share one's life. Thus it seemed to me quite natural that the *revenants* should only exist for just so long as one likes and should be removable at a wish. We have seen what my friend Josef was punished for. But the *revenants* were a series of reincarnations of the friend of my childhood. It was therefore also a source of satisfaction to me that I had always been able to find successive substitutes for that figure; and I felt I should be able to find a substitute for the friend whom I was now on the point of losing: no one was irreplaceable.

But what had become of the dream-censorship? Why had it not raised the most energetic objections against this blatantly egoistic train of thought? And why had it not transformed the satisfaction attached to that train of thought into severe displeasure? The explanation was, I think, that other, unobjectionable, trains of thought in connection with the same people found simultaneous satisfaction and screened with *their* affect the affect which arose from the forbidden infantile source. In another stratum of my thoughts, during the ceremonial unveiling of the memorial, I had reflected thus: 'What a number of valued friends I have lost, some through death, some through a breach of our friendship! How fortunate that I have found a substitute for them and that I have gained one who means more to me than ever the others could, and that, at a time of life when new friendships cannot easily be formed, I shall never lose his!' My satisfaction at having found a substitute for these lost friends could be allowed to enter the dream without interference; but there slipped in, along with it, the hostile satisfaction derived from the infantile source. It is no doubt true that infantile affection served to reinforce my contemporary and justified affection. But infantile hatred, too, succeeded in getting itself represented.

In addition to this, however, the dream contained a clear allusion to another train of thought which could legitimately lead to satisfaction. A short time before, after long expectation, a daughter had been born to my friend. I was aware of how deeply he had mourned the sister he had so early lost and I wrote and told him I was sure he would transfer the love he felt for her on to the child, and that the baby girl would allow him at last to forget his irreparable loss.

Thus this group of thoughts was connected once again with the intermediate thought in the latent content of the dream from which the associative paths diverged in contrary directions: 'No one is irreplaceable!' 'There are nothing but *revenants*: all those we have lost come back!' And now the associative links between the contradictory components of the dream-thoughts were drawn closer by the chance fact that my friend's baby daughter had the same name as the little girl I used to play with as a child, who was of my age and the sister of my earliest friend and opponent. It gave me great *satisfaction* when I heard that the baby was to be called 'Pauline.' And as an allusion to this coincidence, I had replaced one Josef by another in the dream and found it impossible to suppress the similarity between the opening letters of the names 'Fleischl' and 'Fl.' From here my thoughts went on to the subject of the names of my own children. I had insisted on their names being chosen, not according to the fashion of the moment, but in memory of people I have been fond of. Their names made the children into *revenants*. And after all, I reflected, was not having children our only path to immortality?

I have only a few more remarks to add on the subject of affect in dreams from another point of view. A dominating element in a sleeper's mind may be constituted by what we call a 'mood' - or *tendency* to some affect - and this may then have a determining influence upon his dreams. A mood of this kind may arise from his experiences or thoughts during the preceding day, or its sources may be somatic. In either case it will be accompanied by the trains of thought appropriate to it. From the point of view of dream-construction it is a matter of indifference whether, as sometimes happens, these ideational contents of the dream-thoughts determine the mood in a primary fashion, or whether they are themselves aroused secondarily by the dreamer's emotional disposition which is in its turn to be explained on a somatic basis. In any case the construction of dreams is subject to the condition that it can only represent something which is the fulfilment of a wish and that it is only from wishes that it can derive its psychical motive force. A currently active mood is treated in the same way as a sensation arising and becoming currently active during sleep (cf. p. 714), which can be either disregarded or given a fresh interpretation in the sense of a wish-fulfilment. Distressing moods during sleep can become the motive force of a dream by arousing energetic wishes which the dream is supposed to fulfil. The material to which moods are attached is worked over until it can be used to express the fulfilment of a wish. The more intense and dominating a part is played in the dream-thoughts by the distressing mood, the more certain it becomes that the most strongly suppressed wishful impulses will make use of the opportunity in order to achieve representation. For, since the unpleasure which they would otherwise necessarily produce themselves is already present, they find the harder part of their task - the task of forcing their way through to representation - already accomplished for them. Here once more we are brought up against the problem of anxiety-dreams; and these, as we shall find, form a marginal case in the function of dreaming.

(I)

SECONDARY REVISION

And now at last we can turn to the fourth of the factors concerned in the construction of dreams. If we pursue our investigation of the content of dreams in the manner in which we have begun it - that is, by comparing conspicuous events in the dream-content with their sources in the dream-thoughts, we shall come upon elements the explanation of which calls for an entirely new assumption. What I have in mind are cases in which the dreamer is surprised, annoyed or repelled in the dream, and, moreover, by a piece of the dream-content itself. As I have shown in a number of instances, the majority of these critical feelings in dreams are not in fact directed against the content of the dream, but turn out to be portions of the dream-thoughts which have been taken over and used to an appropriate end. But some material of this kind does not lend itself to this explanation; its correlate in the material of the dream-thoughts is nowhere to be found. What, for instance, is the meaning of a critical remark found so often in dreams: 'This is only a dream'? Here we have a genuine piece of criticism of the dream, such as might be made in waking life. Quite frequently, too, it is actually a prelude to waking up; and still more frequently it has been preceded by some distressing feeling which is set at rest by the recognition that the state is one of dreaming. When the thought 'this is only a dream' occurs during a dream, it has the same purpose in view as when the words are pronounced on the stage by *la belle Hélène* in Offenbach's comic opera of that name: it is aimed at reducing the importance of what has just been experienced and at making it possible to tolerate what is to follow. It serves to lull a particular agency to sleep which would have every reason at that moment to bestir itself and forbid the continuance of the dream - or the scene in the opera. It is more comfortable, however, to go on sleeping and tolerate the dream, because, after all, 'it is only a dream.' In my view the contemptuous critical judgement, 'it's only a dream', appears in a dream when the censorship, which is never quite asleep, feels that it has been taken unawares by a dream which has already been allowed through. It is too late to suppress it, and accordingly the censorship uses these words to meet the anxiety or the distressing feeling aroused by it. The phrase is an example of *esprit d'escalier* on the part of the psychical censorship.

This instance, however, provides us with convincing evidence that not everything contained in a dream is derived from the dream-thoughts, but that contributions to its content may be made by a psychical function which is indistinguishable from our waking thoughts. The question now arises whether this only occurs in exceptional cases, or whether the psychical agency which otherwise operates only as a censorship plays a *habitual* part in the construction of dreams.

We can have no hesitation in deciding in favour of the second alternative. There can be no doubt that the censoring agency, whose influence we have so far only recognized in limitations and omissions in the dream-content, is also responsible for interpolations and additions in it. The interpolations are easy to recognize. They are often reported with hesitation, and introduced by an 'as though'; they are not in themselves particularly vivid and are always introduced at points at which they can serve as links between two portions of the dream-content or to bridge a gap between two parts of the dream. They are less easily retained in the memory than genuine derivatives of the material of the dream-thoughts; if the dream is to be forgotten they are the first part of it to disappear, and I have a strong suspicion that the common complaint of having dreamt a lot, but of having forgotten most of it and of having only retained fragments, is based upon the rapid disappearance precisely of these connecting thoughts. In a complete analysis these interpolations are sometimes betrayed by the fact that no material connected with them is to be found in the dream-thoughts. But careful examination leads me to regard this as the less frequent case; as a rule the connecting thoughts lead back nevertheless to material in the dream-thoughts, but to material which could have no claim to acceptance in the dream either on its own account or owing to its being over-determined. Only in extreme cases, it seems, does the psychical function in dream-formation which we are now considering proceed to make new creations. So long as possible, it employs anything appropriate that it can find in the material of the dream-thoughts.

The thing that distinguishes and at the same time reveals this part of the dream-work is its *purpose*. This function behaves in the manner which the poet maliciously ascribes to philosophers: it fills up the gaps in the dream-structure with shreds and patches. As a result of its efforts, the dream loses its appearance of absurdity and disconnectedness and approximates to the model of an intelligible experience. But its efforts are not always crowned with success. Dreams occur which, at a superficial view, may seem faultlessly logical and reasonable; they start from a possible situation, carry it on through a chain of consistent modifications and - though far less frequently - bring it to a conclusion which causes no surprise. Dreams which are of such a kind have been subjected to a far-reaching revision by this psychical function that is akin to waking thought; they appear to have a meaning, but that meaning is as far removed as possible from their true significance. If we analyse them, we can convince ourselves that it is in these dreams that the secondary revision has played about with the material the most freely, and has retained the relations present in that material to the least extent. They are dreams which might be said to have been already interpreted once, before being submitted to waking interpretation. In other dreams this tendentious revision has only partly succeeded; coherence seems to rule for a certain distance, but the dream then becomes senseless or confused, while perhaps later on in its course it may for a second time present an appearance of rationality. In yet other dreams the revision has failed altogether; we find ourselves hopelessly face to face with a heap of fragmentary material.

I do not wish to deny categorically that this fourth power in dream-construction - which we shall soon recognize as all old acquaintance, since in fact it is the only one of the four with which we are familiar in other connections - I do not wish to deny that this fourth factor has the capacity to create new contributions to dreams. It is certain, however, that, like the others, it exerts its influence principally by its preferences and selections from psychical material in the dream-thoughts that has already been formed. Now there is one case in which it is to a great extent spared the labour of, as it were, building up a façade for the dream - the case, namely, in which a formation of that kind already exists, available for use in the material of the dream-thoughts. I am in the habit of describing the element in the dream-thoughts which I have in mind as a 'phantasy.' I shall perhaps avoid misunderstanding if I mention the 'day-dream' as something analogous to it in waking life.¹ The part played in our mental life by these structures has not yet been fully recognized and elucidated by psychiatrists, though M. Benedikt has made what seems to me a very promising start in that direction. The importance of day-dreams has not escaped the unerring vision of imaginative writers; there is, for instance, a well-known account by Alphonse Daudet in *Le Nabab* of the day-dreams of one of the minor characters in that story. The study of the psychoneuroses leads to the surprising discovery that these phantasies or day-dreams are the immediate forerunners of hysterical symptoms, or at least of a whole number of them. Hysterical symptoms are not attached to actual memories, but to phantasies erected on the basis of the basis of memories. The frequent occurrence of conscious daytime phantasies brings these structures to our knowledge; but just as there are phantasies of this kind which are conscious, so, too, there are unconscious ones in great numbers, which have to remain unconscious on account of their content and of their origin from repressed material. Closer investigation of the characteristics of these day-time phantasies shows us how right it is that these formations should bear the same name as we give to the products of our thought during the night - the name, that is, of 'dreams.' They share a large number of their properties with night-dreams, and their investigation might, in fact, have served as the shortest and best approach to an understanding of night-dreams.

¹ 'Rêve', '*petit roman*', - 'day-dream', '[continuous] story'.

Like dreams, they are wish-fulfilments; like dreams, they are based to a great extent on impressions of infantile experiences; like dreams, they benefit by a certain degree of relaxation of censorship. If we examine their structure, we shall perceive the way in which the wishful purpose that is at work in their production has mixed up the material of which they are built, has rearranged it and has formed it into a new whole. They stand in much the same relation to the childhood memories from which they are derived as do some of the Baroque palaces of Rome to the ancient ruins whose pavements and columns have provided the material for the more recent structures.

The function of 'secondary revision', which we have attributed to the fourth of the factors concerned in shaping the content of dreams, shows us in operation once more the activity which is able to find free vent in the creation of day-dreams without being inhibited by any other influences. We might put it simply by saying that this fourth factor of ours seeks to mould the material offered to it into something like a day-dream. If, however, a day-dream of this kind has already been formed within the nexus of the dream-thoughts, this fourth factor in the dream-work will prefer to take possession of the ready-made day-dream and seek to introduce it into the content of the dream. There are some dreams which consist merely in the repetition of a day-time phantasy which may perhaps have remained unconscious: such, for instance, as the boy's dream of driving in a war-chariot with the heroes of the Trojan War. In my 'Autodidasker' dream the second part at all events was a faithful reproduction of a daytime phantasy, innocent in itself, of a conversation with Professor N. In view of the complicated conditions which a dream has to satisfy when it comes into existence, it happens more frequently that the ready-made phantasy forms only a portion of the dream, or that only a portion of the phantasy forces its way into the dream. Thereafter, the phantasy is treated in general like any other portion of the latent material, though it often remains recognizable as an entity in the dream. There are often parts of my dreams which stand out as producing a different impression from the rest. They strike me as being, as it were, more fluent, more connected and at the same time more fleeting than other parts of the same dream. These, I know, are unconscious phantasies which have found their way into the fabric of the dream, but I have never succeeded in pinning down a phantasy of this kind. Apart from this, these phantasies, like any other component of the dream-thoughts, are compressed, condensed, superimposed on one another, and so on. There are, however, transitional cases, between the case in which they constitute the content (or at least the façade) of the dream unaltered and the extreme opposite in which they are represented in the content of the dream only by one of their elements or by a distant allusion. What happens to phantasies present in the dream-thoughts is evidently also determined by any advantages they may have to offer the requirements of the censorship and of the urge towards condensation.

In selecting examples of dream-interpretation I have so far as possible avoided dreams in which unconscious phantasies play any considerable part, because the introduction of this particular psychical element would have necessitated lengthy discussions on the psychology of unconscious thinking. Nevertheless, I cannot completely escape a consideration of phantasies in this connection, since they often make their way complete into dreams and since still more often clear glimpses of them can be seen behind the dream. I will therefore quote one more dream, which seems to be composed of two different and opposing phantasies which coincide with each other at a few points and of which one is superficial while the second is, as it were, an interpretation of the first.¹

The dream - it is the only one of which I possess no careful notes - ran roughly as follows. The dreamer, a young unmarried man, was sitting in the restaurant at which he usually ate and which was presented realistically in the dream. Several people then appeared, in order to fetch him away, and one of them wanted to arrest him. He said to his companions at table: 'I'll pay later; I'll come back.' But they exclaimed with derisive smiles: 'We know all about that; that's what they all say!' One of the guests called out after him: 'There goes another one!' He was then led into a narrow room in which he found a female figure carrying a child. One of the people accompanying him said: 'This is Herr Müller.' A police inspector, or some such official, was turning over a bundle of cards or papers and as he did so repeated 'Müller, Müller, Müller.' Finally he asked the dreamer a question, which he answered with an 'I will.' He then turned round to look at the female figure and observed that she was now wearing a big beard.

¹ [Footnote added 1909:] In my 'Fragment of an Analysis of a Case of Hysteria' (1905e), I have analysed a good specimen of a dream of this sort, made up of a number of superimposed phantasies. Incidentally, I underestimated the importance of the part played by these phantasies in the formation of dreams so long as I was principally working on my own dreams, which are usually based on discussions and conflict of thought and comparatively rarely on day-dreams. In the case of other people it is often much easier to demonstrate the complete analogy between night-dreams and day-dreams. With hysterical patients, a hysterical attack can often be replaced by a dream; and it is then easy to convince oneself that the immediate forerunner of *both* these psychical structures was a day-dream phantasy.

Here there is no difficulty in separating the two components. The superficial one was a *phantasy of arrest* which appears as though it had been freshly constructed by the dream-work. But behind it some material is visible which had been only slightly re-shaped by the dream-work: a *phantasy of marriage*. Those features which were common to both phantasies emerge with special clarity, in the same way as in one of Galton's composite photographs. The promise made by the young man (who up till then had been a bachelor) that he would come back and join his fellow-diners at their table, the scepticism of his boon-companions (whom experience had taught better), the exclamation 'there goes another one' - all of these features fitted in easily with the alternative interpretation. So, too, did the 'I will' with which he replied to the official's question. The turning over the bundle of papers, with the constant repetition of the same name corresponded to a less important but recognizable feature of wedding festivities, namely the reading out of a bundle of telegrams of congratulation, all of them with addresses bearing the same names. The phantasy of marriage actually scored a victory over the covering phantasy of arrest in the fact of the bride's making a personal appearance in the dream. I was able to discover from an enquiry - the dream was not analysed - why it was that at the end of it the bride wore a beard. On the previous day the dreamer had been walking in the street with a friend who was as shy of marrying as he was himself, and he had drawn his friend's attention to a darkhaired beauty who had passed them. 'Yes', his friend had remarked, 'if only women like that didn't grow beards like their fathers' in a few years' time.' This dream did not, of course, lack elements in which dream-distortion had been carried deeper. It may well be, for instance, that the words 'I'll pay later' referred to what he feared might be his father-in-law's attitude on the subject of a dowry. In fact, all kinds of qualms were evidently preventing the dreamer from throwing himself into the phantasy of marriage with any enjoyment. One of these qualms, a fear that marriage might cost him his freedom, was embodied in the transformation into a scene of arrest.

If we return for a moment to the point that the dream-work is glad to make use of a ready-made phantasy instead of putting one together out of the material of the dream-thoughts, we may perhaps find ourselves in a position to solve one of the most interesting puzzles connected with dreams. On pp. 568 f. I told the well-known anecdote of how Maury, having been struck in his sleep on the back of his neck by a piece of wood, woke up from a long dream which was like a full-length story set in the days of the French Revolution. Since the dream, as reported, was a coherent one and was planned entirely with an eye to providing an explanation of the stimulus which woke him and whose occurrence he could not have anticipated, the only possible hypothesis seems to be that the whole elaborate dream must have been composed and must have taken place in the short period of time between the contact of the board with Maury's cervical vertebrae and his consequent awakening. We should never dare to attribute such rapidity to thought-activity in waking life, and we should therefore be driven to conclude that the dream-work possesses the advantage of accelerating our thought-processes to a remarkable degree.

Strong objections have been raised to what quickly became a popular conclusion by some more recent writers (Le Lorrain, 1894 and 1895, Egger, 1895, and others). On the one hand they throw doubts upon the accuracy of Maury's account of his dream; and on the other hand they attempt to show that the rapidity of the operations of our waking thoughts is no less than in this dream when exaggerations have been discounted. The discussion raised questions of principle which do not seem to me immediately soluble. But I must confess that the arguments brought forward (by Egger, for instance), particularly against Maury's guillotine dream, leave me unconvinced. I myself would propose the following explanation of this dream. Is it so highly improbable that Maury's dream represents a phantasy which had been stored up ready-made in his memory for many years and which was aroused - or I would rather say 'alluded to' - at the moment at which he became aware of the stimulus which woke him? If this were so, we should have escaped the whole difficulty of understanding how such a long story with all its details could have been composed in the extremely short period of time which was at the dreamer's disposal - for the story would have been composed already. If the piece of wood had struck the back of Maury's neck while he was awake, there would have been an opportunity for some such thought as: 'That's just like being guillotined.' But since it was in his sleep that he was struck by the board, the dream-work made use of the impinging stimulus in order rapidly to produce a wish-fulfilment; it was *as though* it thought (this is to be taken purely figuratively): 'Here's a good opportunity of realizing a wishful phantasy which was formed at such and such a time in the course of reading.' It can hardly be disputed, I think, that the dream-story was precisely of a sort likely to be constructed by a young man under the influence of powerfully exciting impressions. Who - least of all what Frenchman or student of the history of civilization - could fail to be gripped by narratives of the Reign of Terror, when the men and women of the aristocracy, the flower of the nation, showed that they could die with a cheerful mind and could retain the liveliness of their wit and the elegance of their manners till the very moment of the fatal summons? How tempting for a young man to plunge into all this in his imagination - to picture himself bidding a lady farewell - kissing her hand and mounting the scaffold unafraid! Or, if ambition were the prime motive of the phantasy, how tempting for him to take the place of one of those formidable figures who, by the power alone of their thoughts and flaming eloquence, ruled the city in which the heart of humanity beat convulsively in those days - who were led by their convictions to send thousands of men to their death and who prepared the way for the transformation of Europe, while all the time their own heads were insecure and destined to fall one day beneath the knife of the guillotine - how tempting to picture himself as one of the Girondists, perhaps, or as the heroic Danton! There is one feature in Maury's recollection of the dream, his being 'led to the place of execution, surrounded by an immense mob', which seems to suggest that his phantasy was in fact of this ambitious type.

Nor is it necessary that this long-prepared phantasy should have been gone through during sleep; it would have been sufficient for it to be merely touched on. What I mean is this. If a few bars of music are played and someone comments that it is from Mozart's *Figaro* (as happens in *Don Giovanni*) a number of recollections are roused in me all at once, none of which can enter my consciousness singly at the first moment. The key-phrase serves as a port of entry through which the whole network is simultaneously put in a state of excitation. It may well be the same in the case of unconscious thinking. The rousing stimulus excites the psychical port of entry which allows access to the whole guillotine phantasy. But the phantasy is not gone through during sleep but only in the recollection of the sleeper after his awakening. After waking he remembers in all its details the phantasy which was stirred up as a whole in his dream. One has no means of assuring oneself in such a case that one is really remembering something one has dreamt. This same explanation - that it is a question of ready-made phantasies which are brought into excitation as a whole by the rousing stimulus - can be applied to other dreams which are focused upon a rousing stimulus, such, for instance, as Napoleon's battle dream before the explosion of the infernal machine.

Among the dreams collected by Justine Tobowolska in her dissertation on the apparent passage of time in dreams, the most informative seems to me to be the one reported by Macario (1857) as having been dreamt by a dramatic author, Casimir Bonjour. One evening Bonjour wanted to attend the first performance of one of his pieces; but he was so fatigued that as he was sitting behind the scenes he dozed off just at the moment the curtain went up. During his sleep he went through the whole five acts of the play, and observed all the various signs of emotion shown by the audience during the different scenes. At the end of the performance he was delighted to hear his name being shouted with the liveliest demonstrations of applause. Suddenly he woke up. He could not believe either his eyes or his ears, for the performance had not gone beyond the first few lines of the first scene; he could not have been asleep for longer than two minutes. It is surely not too rash to suppose in the case of this dream that the dreamer's going through all five acts of the play and observing the attitude of the public to different passages in it need not have arisen from any fresh production of material during his sleep, but may have reproduced a piece of phantasy-activity (in the sense I have described) which had already been completed. Tobowolska, like other writers, emphasizes the fact that dreams with an accelerated passage of ideas have the common characteristic of seeming specially coherent, quite unlike other dreams, and that the recollection of them is summary far more than detailed. This would indeed be a characteristic which ready-made phantasies of this kind, touched upon by the dream-work, would be bound to possess, though this is a conclusion which the writers in question fail to draw. I do not assert, however, that *all* arousal dreams admit of this explanation, or that the problem of the accelerated passage of ideas in dreams can be entirely dismissed in this fashion.

At this point it is impossible to avoid considering the relation between this secondary revision of the content of dreams and the remaining factors of the dream-work. Are we to suppose that what happens is that in the first instance the dream-constructing factors - the tendency towards condensation, the necessity for evading the censorship, and considerations of representability by the psychical means open to dreams - put together a provisional dream-content out of the material provided, and that this content is subsequently re-cast so as to conform so far as possible to the demands of a second agency! This is scarcely probable. We must assume rather that from the very first the demands of this second factor constitute one of the conditions which the dream must satisfy and that this condition, like those laid down by condensation, the censorship imposed by resistance, and representability, operates simultaneously in a conducive and selective sense upon the mass of material present in the dream-thoughts. In any case, however, of the four conditions for the formation of dreams, the one we have come to know last is the one whose demands appear to have the least cogent influence on dreams.

The following consideration makes it highly probable that the psychical function which carries out what we have described as the secondary revision of the content of dreams is to be identified with the activity of our waking thought. Our waking (preconscious) thinking behaves towards any perceptual material with which it meets in just the same way in which the function we are considering behaves towards the content of dreams. It is the nature of our waking thought to establish order in material of that kind, to set up relations in it and to make it conform to our expectations of an intelligible whole. In fact, we go too far in that direction. An adept in sleight of hand can trick us by relying upon this intellectual habit of ours. In our efforts at making an intelligible pattern of the sense-impressions that are offered to us, we often fall into the strangest errors or even falsify the truth about the material before us.

The evidences of this are too universally known for there to be any need to insist upon them further. In our reading we pass over misprints which destroy the sense, and have the illusion that what we are reading is correct. The editor of a popular French periodical is said to have made a bet that he would have the words 'in front' or 'behind' inserted by the printer in every sentence of a long article without a single one of his readers noticing it. He won his bet. Many years ago I read in a newspaper a comic instance of a false connection. On one occasion during a sitting of the French Chamber a bomb thrown by an anarchist exploded in the Chamber itself and Dupuy subdued the consequent panic with the courageous words: '*La séance continue.*' The visitors in the gallery were asked to give their impressions as witnesses of the outrage. Among them were two men from the provinces. One of these said that it was true that he had heard a detonation at the close of one of the speeches but had assumed that it was a parliamentary usage to fire a shot each time a speaker sat down. The second one, who had probably already heard *several* speeches, had come to the same conclusion, except that he supposed that a shot was only fired as a tribute to a particularly successful speech.

There is no doubt, then, that it is our normal thinking that is the psychical agency which approaches the content of dreams with a demand that it must be intelligible, which subjects it to a first interpretation and which consequently produces a complete misunderstanding of it. For the purposes of *our* interpretation it remains an essential rule invariably to leave out of account the ostensible continuity of a dream as being of suspect origin, and to follow the same path back to the material of the dream-thoughts, no matter whether the dream itself is clear or confused.

We now perceive, incidentally, on what it is that the range in the quality of dreams between confusion and clarity which was discussed on [p. 779 f.](#) depends. Those parts of a dream on which the secondary revision has been able to produce some effect are clear, while those parts on which its efforts have failed are confused. Since the confused parts of a dream are so often at the same time the less vivid parts, we may conclude that the secondary dream-work is also to be held responsible for a contribution to the plastic intensity of the different dream-elements.

If I look around for something with which to compare the final form assumed by a dream as it appears after normal thought has made its contribution, I can think of nothing better than the enigmatic inscriptions with which *Fliegende Blätter* has for so long entertained its readers. They are intended to make the reader believe that a certain sentence - for the sake of contrast, a sentence in dialect and as scurrilous as possible - is a Latin inscription. For this purpose the letters contained in the words are torn out of their combination into syllables and arranged in a new order. Here and there a genuine Latin word appears; at other points we seem to see abbreviations of Latin words before us; and at still other points in the inscription we may allow ourselves to be deceived into overlooking the senselessness of isolated letters by parts of the inscription seeming to be defaced or showing lacunae. If we are to avoid being taken in by the joke, we must disregard everything that makes it seem like an inscription, look firmly at the letters, pay no attention to their ostensible arrangement, and so combine them into words belonging to our own mother tongue.

Secondary revision is the one factor in the dream-work which has been observed by the majority of writers on the subject and of which the significance has been appreciated. Havelock Ellis (1911, 10-11) has given an amusing account of its functioning: 'Sleeping consciousness we may even imagine as saying to itself in effect: "Here comes our master, Waking Consciousness, who attaches such mighty importance to reason and logic and so forth. Quick! gather things up, put them in order - any order will do - before he enters to take possession."'

The identity of its method of working with that of waking thought has been stated with particular clarity by Delacroix (1904, 926): 'Cette fonction d'interprétation n'est pas particulière au rêve; c'est le même travail de coordination logique que nous faisons sur nos sensations pendant la veille.'¹ James Sully is of the same opinion. So, too, is Tobowolska (1900, 93): 'Sur ces successions incohérentes d'hallucinations, l'esprit s'efforce de faire le même travail de coordination logique qu'il fait pendant la veille sur les sensations. Il relie entre elles par un lien imaginaire toutes ces images décousues et bouche les écarts trop grands qui se trouvaient entre elles.'²

¹ ['This interpretative function is not peculiar to dreams. It is the same work of logical co-ordination which we carry out upon our sensations while we are awake.']

² ['The mind endeavours to carry out upon these incoherent trains of hallucinations the same work of logical co-ordination that it carries out upon sensations during the daytime. It connects up all these detached images by an imaginary link and stops up any excessively wide gaps between them.']

According to some writers, this process of arranging and interpreting begins during the dream itself and is continued after waking. Thus Paulhan (1894, 546): 'Cependant j'ai souvent pensé qu'il pouvait y avoir une certaine déformation, ou plutôt reformation, du rêve dans le souvenir. . . . La tendance systématisante de l'imagination pourrait fort bien achever après le réveil ce qu'elle a ébauché pendant le sommeil. De la sorte, la rapidité réelle de la pensée serait augmentée en apparence par les perfectionnements dus à l'imagination éveillée.'¹ Bernard-Leroy and Tobowolska (1901, 592): 'Dans le rêve, au contraire, l'interprétation et la coordination se font non seulement à l'aide des données du rêve, mais encore à l'aide de celles de la veille. . . .'²

Inevitably, therefore, this one recognized factor in the formation of dreams has had its importance overestimated, so that it has been credited with the whole achievement of the creation of dreams. This act of creation, as Goblots (1896, 280 f.) and still more Foucault (1906) suppose, is performed at the moment of waking; for these two writers attribute to waking thought an ability to construct a dream out of the thoughts that emerge during sleep. Bernard-Leroy and Tobowolska (1901) comment on this view: 'On a cru pouvoir placer le rêve au moment du réveil, et ils ont attribué à la pensée de la veille la fonction de construire le rêve avec les images présentes dans la pensée du sommeil.'³

¹ ['I have often thought, however, that dreams may be to some extent misshaped, or rather reshaped, in memory. . . . The tendency of the imagination towards systematization might very well complete after waking what it had started upon in sleep. In that way the real speed of thought would be given an apparent increase by the improvements due to the waking imagination.']

² ['In a dream, on the contrary, interpretation and co-ordination are carried out by the help not only of the data presented in the dream, but of the data available in waking life. . . .']

³ ['It has been thought possible to locate dreams at the moment of waking, and have ascribed to waking thought the function of constructing dreams out of the images present in sleeping thought.']

From this discussion of secondary revision I will go on to consider a further factor in the dream-work which has recently been brought to light by some finely perceptive observations carried out by Herbert Silberer. As I have mentioned earlier (p. 814 ff.), Silberer has, as it were, caught in the very act the process of transforming thoughts into images, by forcing himself into intellectual activity while he was in a state of fatigue and drowsiness. At such moments the thought with which he was dealing vanished and was replaced by a vision which turned out to be a substitute for what were as a rule abstract thoughts, (Cf. the examples in the passage just referred to.) Now it happened during these experiments that the image which arose, and which might be compared to an element of a dream, sometimes represented something other than the thought that was being dealt with - namely, the fatigue itself, the difficulty and unpleasure involved in the work. It represented, that is to say, the subjective state and mode of functioning of the person making the effort instead of the object of his efforts. Silberer described occurrences of this kind, which were very frequent in his case, as a 'functional phenomenon' in contrast to the 'material phenomenon' which would have been expected.

For instance: 'One afternoon I was lying on my sofa feeling extremely sleepy; nevertheless I forced myself to think over a philosophical problem. I wanted to compare the views of Kant and Schopenhauer upon Time. As a result of my drowsiness I was unable to keep the arguments of both of them before my mind at once, which was necessary in order to make the comparison. After a number of vain attempts, I once more impressed Kant's deductions upon my mind with all the strength of my will, so that I might apply them to Schopenhauer's statement of the problem. I then directed my attention to the latter; but when I tried to turn back again to Kant, I found that his argument had once more escaped me and I tried vainly to pick it up once more. This vain effort at recovering the Kant *dossier* which was stored away somewhere in my head was suddenly represented before my closed eyes as a concrete and plastic symbol, as though it were a dream-picture: *I was asking for information from a disobliging secretary who was bent over his writing-table and refused to put himself out at my insistent demand. He half straightened himself and gave me a disagreeable and uncomplying look*'. (Silberer, 1909, 513 f.)

Here are some other instances, which relate to the oscillation between sleeping and waking:

'Example No. 2. - Circumstances: In the morning, at waking. While I was at a certain depth of sleep (a twilight state) and reflecting over a previous dream and in a sort of way continuing to dream it, I felt myself approaching nearer to waking consciousness but wanted to remain in the twilight state.

'Scene: *I was stepping across a brook with one foot but drew it back again at once with the intention of remaining on this side.*' (Silberer, 1912, 625.)

'Example No. 6. - Conditions as in example No. 4' (in which he had wanted to lie in bed a little longer, though without oversleeping). 'I wanted to give way to sleep for a little longer.

'Scene: *I was saying good-bye to someone and was arranging with him (or her) to meet him (or her) again soon.*' (Ibid., 627.)

The 'functional' phenomenon, 'the representation of a state instead of an object', was observed by Silberer principally in the two conditions of falling asleep and waking up. It is obvious that dream-interpretation is only concerned with the latter case. Silberer has given examples which show convincingly that in many dreams the last pieces of the manifest content, which are immediately followed by waking, represent nothing more nor less than an intention to wake or the process of waking. The representation may be in terms of such images as crossing a threshold ('threshold symbolism'), leaving one room and entering another, departure, home-coming, parting with a companion, diving into water, etc. I cannot, however, refrain from remarking that I have come across dream-elements which can be related to threshold symbolism, whether in my own dreams or in those of subjects whom I have analysed, far less frequently than Silberer's communications would have led one to expect.

It is by no means inconceivable or improbable that this threshold symbolism might throw light upon some elements in the middle of the texture of dreams - in places, for instance, where there is a question of oscillations in the depth of sleep and of an inclination to break off the dream. Convincing instances of this, however, have not been produced. What seem to occur more frequently are cases of overdetermination, in which a part of a dream which has derived its material content from the nexus of dream-thoughts is employed to represent *in addition* some state of mental activity.

This very interesting functional phenomenon of Silberer's has, through no fault of its discoverer's, led to many abuses; for it has been regarded as lending support to the old inclination to give abstract and symbolic interpretations to dreams. The preference for the 'functional category' is carried so far by some people that they speak of the functional phenomenon wherever intellectual activities or emotional processes occur in the dream-thoughts, although such material has neither more nor less right than any other kind to find its way into a dream as residues of the previous day.

We are ready to recognize the fact that Silberer's phenomena constitute a second contribution on the part of waking thought to the construction of dreams; though it is less regularly present and less significant than the first one, which has already been introduced under the name of 'secondary revision.' It has been shown that a part of the attention which operates during the day continues to be directed towards dreams during the state of sleep, that it keeps a check on them and criticizes them and reserves the power to interrupt them. It has seemed plausible to recognize in the mental agency which thus remains awake the censor to whom we have had to attribute such a powerful restricting influence upon the form taken by dreams. What Silberer's observations have added to this is the fact that in certain circumstances a species of self-observation plays a part in this and makes a contribution to the content of the dream. The probable relations of this self-observing agency, which may be particularly prominent in philosophical minds, to endopsychic perception, to delusions of observation, to conscience and to the censor of dreams can be more appropriately treated elsewhere.¹

¹ [Footnote added 1914:] 'On Narcissism' (Freud, 1914c).

I will now try to sum up this lengthy disquisition on the dream-work. We were faced by the question whether the mind employs the whole of its faculties without reserve in constructing dreams or only a functionally restricted fragment of them. Our investigations led us to reject entirely the form in which the question was framed as being inadequate to the circumstances. If, however, we had to reply to the question on the basis of the terms in which it was stated, we should be obliged to reply in the affirmative to *both* the alternatives, mutually exclusive though they appear to be. Two separate functions may be distinguished in mental activity during the construction of a dream: the production of the dream-thoughts, and their transformation into the content of the dream. The dream-thoughts are entirely rational and are constructed with an expenditure of all the psychical energy of which we are capable. They have their place among thought-processes that have not become conscious - processes from which, after some modification, our conscious thoughts, too, arise. However many interesting and puzzling questions the dream-thoughts may involve, such questions have, after all, no special relation to dreams and do not call for treatment among the problems of dreams.¹ On the other hand, the second function of mental activity during dream-construction, the transformation of the unconscious thoughts into the content of the dream, is peculiar to dream-life and characteristic of it. This dream-work proper diverges further from our picture of waking thought than has been supposed even by the most determined depreciator of psychical functioning during the formation of dreams. The dream-work is not simply more careless, more irrational, more forgetful and more incomplete than waking thought; it is completely different from it qualitatively and for that reason not immediately comparable with it. It does not think, calculate or judge in any way at all; it restricts itself to giving things a new form. It is exhaustively described by an enumeration of the conditions which it has to satisfy in producing its result. That product, the dream, has above all to evade the censorship, and with that end in view the dream-work makes use of a *displacement of psychical intensities* to the point of a transvaluation of all psychical values. The thoughts have to be reproduced exclusively or predominantly in the material of visual and acoustic memory-traces, and this necessity imposes upon the dream-work *considerations of representability* which it meets by carrying out fresh displacements. Greater intensities have probably to be produced than are available in the dream-thoughts at night, and this purpose is served by the extensive *condensation* which is carried out with the constituents of the dream-thoughts. Little attention is paid to the logical relations between the thoughts; those relations are ultimately given a disguised representation in certain *formal* characteristics of dreams. Any affect attached to the dream-thoughts undergoes less modification than their ideational content. Such affects are as a rule suppressed; when they are retained, they are detached from the ideas that properly belong to them, affects of a similar character being brought together. Only a single portion of the dream-work and one which operates to an irregular degree, the working over of the material by partly aroused waking thought, tallies to some extent with the view which other writers have sought to apply to the entire activity of dream-construction.

¹ [Footnote added 1925:] I used at one time to find it extraordinarily difficult to accustom readers to the distinction between the manifest content of dreams and the latent dream-thoughts. Again and again arguments and objections would be brought up based upon some uninterpreted dream in the form in which it had been retained in the memory, and the need to interpret it would be ignored. But now that analysts at least have become reconciled to replacing the manifest dream by the meaning revealed by its interpretation, many of them have become guilty of falling into another confusion which they cling to with equal obstinacy. They seek to find the essence of dreams in their latent content and in so doing they overlook the distinction between the latent dream-thoughts and the dream-work. At bottom, dreams are nothing other than a particular *form* of thinking, made possible by the conditions of the state of sleep. It is the *dream-work* which creates that form, and it alone is the essence of dreaming - the explanation of its peculiar nature. I say this in order to make it possible to assess the value of the notorious 'prospective purpose' of dreams. The fact that dreams concern themselves with attempts at solving the problems by which our mental life is faced is no more strange than that our conscious waking life should do so; beyond this it merely tells us that that activity can also be carried on in the preconscious - and this we already knew.

CHAPTER VII

THE PSYCHOLOGY OF THE DREAM PROCESSES

Among the dreams which have been reported to me by other people, there is one which has special claims upon our attention at this point. It was told to me by a woman patient who had herself heard it in a lecture on dreams: its actual source is still unknown to me. Its content made an impression on the lady, however, and she proceeded to 're-dream' it, that is, to repeat some of its elements in a dream of her own, so that, by taking it over in this way, she might express her agreement with it on one particular point.

The preliminaries to this model dream were as follows. A father had been watching beside his child's sick-bed for days and nights on end. After the child had died, he went into the next room to lie down, but left the door open so that he could see from his bedroom into the room in which his child's body was laid out, with tall candles standing round it. An old man had been engaged to keep watch over it, and sat beside the body murmuring prayers. After a few hours' sleep, the father had a dream that *his child was standing besides his bed, caught him by the arm and whispered to him reproachfully: 'Father, don't you see I'm burning?'* He woke up, noticed a bright glare of light from the next room, hurried into it and found that the old watchman had dropped off to sleep and that the wrappings and one of the arms of his beloved child's dead body had been burned by a lighted candle that had fallen on them.

The explanation of this moving dream is simple enough and, so my patient told me, was correctly given by the lecturer. The glare of light shone through the open door into the sleeping man's eyes and led him to the conclusion which he would have arrived at if he had been awake, namely that a candle had fallen over and set something alight in the neighbourhood of the body. It is even possible that he had felt some concern when he went to sleep as to whether the old man might not be incompetent to carry out his task.

Nor have I any changes to suggest in this interpretation except to add that the content of the dream must have been overdetermined and that the words spoken by the child must have been made up of words which he had actually spoken in his lifetime and which were connected with important events in the father's mind. For instance, '*I'm burning*' may have been spoken during the fever of the child's last illness, and '*Father, don't you see?*' may have been derived from some other highly emotional situation of which we are in ignorance.

But, having recognized that the dream was a process with a meaning, and that it can be inserted into the chain of the dreamer's psychical experiences, we may still wonder why it was that a dream occurred at all in such circumstances, when the most rapid possible awakening was called for. And here we shall observe that this dream, too, contained the fulfilment of a wish. The dead child behaved in the dream like a living one: he himself warned his father, came to his bed, and caught him by the arm, just as he had probably done on the occasion from the memory of which the first part of the child's words in the dream were derived. For the sake of the fulfilment of this wish the father prolonged his sleep by one moment. The dream was preferred to a waking reflection because it was able to show the child as once more alive. If the father had woken up first and then made the inference that led him to go into the next room, he would, as it were, have shortened his child's life by that moment of time.

There can be no doubt what the peculiar feature is which attracts our interest to this brief dream. Hitherto we have been principally concerned with the secret meaning of dreams and the method of discovering it and with the means employed by the dream-work for concealing it. The problems of dream-interpretation have hitherto occupied the centre of the picture. And now we come upon a dream which raises no problem of interpretation and the meaning of which is obvious, but which, as we see, nevertheless retains the essential characteristics that differentiate dreams so strikingly from waking life and consequently call for explanation. It is only after we have disposed of everything that has to do with the work of interpretation that we can begin to realize the incompleteness of our psychology of dreams.

But before starting off along this new path, it will be well to pause and look around, to see whether in the course of our journey up to this point we have overlooked anything of importance. For it must be clearly understood that the easy and agreeable portion of our journey lies behind us. Hitherto, unless I am greatly mistaken, all the paths along which we have travelled have led us towards the light - towards elucidation and fuller understanding. But as soon as we endeavour to penetrate more deeply into the mental process involved in dreaming, every path will end in darkness. There is no possibility of *explaining* dreams as a psychical process, since to explain a thing means to trace it back to something already known, and there is at the present time no established psychological knowledge under which we could subsume what the psychological examination of dreams enables us to infer as a basis for their explanation. On the contrary, we shall be obliged to set up a number of fresh hypotheses which touch tentatively upon the structure of the apparatus of the mind and upon the play of forces operating in it. We must be careful, however, not to pursue these hypotheses too far beyond their first logical links, or their value will be lost in uncertainties. Even if we make no false inferences and take all the logical possibilities into account, the probable incompleteness of our premises threatens to bring our calculation to a complete miscarriage. No conclusions upon the construction and working methods of the mental instrument can be arrived at or at least fully proved from even the most painstaking investigation of dreams or of any other mental function taken *in isolation*. To achieve this result, it will be necessary to correlate all the established implications derived from a comparative study of a whole series of such functions. Thus the psychological hypotheses to which we are led by an analysis of the processes of dreaming must be left, as it were, in suspense, until they can be related to the findings of other enquiries which seek to approach the kernel of the same problem from another angle.

(A)

THE FORGETTING OF DREAMS

I suggest, therefore, that we should first turn to a topic that raises a difficulty which we have not hitherto considered but which is nevertheless capable of cutting the ground from under all our efforts at interpreting dreams. It has been objected on more than one occasion that we have in fact no knowledge of the dreams that we set out to interpret, or, speaking more correctly, that we have no guarantee that we know them as they actually occurred. (See p. 555 ff.)

In the first place, what we remember of a dream and what we exercise our interpretative arts upon has been mutilated by the untrustworthiness of our memory, which seems quite especially incapable of retaining a dream and may well have lost precisely the most important parts of its content. It quite frequently happens that when we seek to turn our attention to one of our dreams we find ourselves regretting the fact that, though we dreamt far more, we can remember nothing but a single fragment which is itself recollected with peculiar uncertainty.

Secondly, there is every reason to suspect that our memory of dreams is not only fragmentary but positively inaccurate and falsified. On the one hand it may be doubted whether what we dreamt was really as disconnected and hazy as our recollection of it; and on the other hand it may also be doubted whether a dream was really as connected as it is in the account we give of it, whether in attempting to reproduce it we do not fill in what was never there, or what has been forgotten, with new and arbitrarily selected material, whether we do not add embellishments and trimmings and round it off so that there is no possibility of deciding what its original content may have been. Indeed one author, Spitta (1882),¹ goes to the point of suggesting that in so far as a dream shows any kind of order or coherence, these qualities are only introduced into it when we try to recall it to mind. Thus there seems to be a danger that the very thing whose value we have undertaken to assess may slip completely through our fingers.

¹ So too Foucault and Talmery.

Hitherto in interpreting dreams we have disregarded such warnings. On the contrary, we have accepted it as being just as important to interpret the smallest, least conspicuous and most uncertain constituents of the content of dreams as those that are most clearly and certainly preserved. The dream of Irma's injection contained the phrase 'I *at once* called in Dr. M.'; and we assumed that even this detail would not have found its way into the dream unless it had had some particular origin. It was thus that we came upon the story of the unfortunate patient to whose bedside I had 'at once' called in my senior colleague. In the apparently absurd dream which treated the difference between 51 and 56 as a negligible quantity, the number 51 was mentioned several times. Instead of regarding this as a matter of course or as something indifferent, we inferred from it that there was a *second* line of thought in the latent content of the dream leading to the number 51; and along this track we arrived at my fears of 51 years being the limit of my life, in glaring contrast to the dream's dominant train of thought which was lavish in its boasts of a long life. In the '*Non vixit*' dream there was an inconspicuous interpolation which I overlooked at first: '*As P. failed to understand him, Fl. asked me*', etc. When the interpretation was held up, I went back to these words and it was they that led me on to the childhood phantasy which turned out to be an intermediate nodal point in the dream-thoughts. This was arrived at by way of the lines:

Selten habt ihr mich *verstanden*,
 Selten auch verstand ich Euch,
 Nur wenn wir im *Kot* uns fanden,
 So verstanden wir uns gleich.¹

Examples could be found in every analysis to show that precisely the most trivial elements of a dream are indispensable to its interpretation and that the work in hand is held up if attention is not paid to these elements until too late. We have attached no less importance in interpreting dreams to every shade of the form of words in which they were laid before us. And even when it happened that the text of the dream as we had it was meaningless or inadequate - as though the effort to give a correct account of it had been unsuccessful - we have taken this defect into account as well. In short, we have treated as Holy Writ what previous writers have regarded as an arbitrary improvisation, hurriedly patched together in the embarrassment of the moment. This contradiction stands in need of an explanation.

¹ [Literally: 'Rarely have you *understood* me, and rarely too have I understood you. Not until we both found ourselves in the *mud* did we promptly understand each other.' Heine, *Buch der Lieder*, 'Die Heimkehr', LXXVIII.]

The explanation is in our favour, though without putting the other writers in the wrong. In the light of our newly-won understanding of the origin of dreams the contradiction disappears completely. It is true that we distort dreams in attempting to reproduce them; here we find at work once more the process which we have described as the secondary (and often ill-conceived) revision of the dream by the agency which carries out normal thinking. But this distortion is itself no more than a part of the revision to which the dream-thoughts are regularly subjected as a result of the dream-censorship. The other writers have at this point noticed or suspected the part of dream-distortion which operates manifestly; we are less interested, since we know that a much more far-reaching process of distortion, though a less obvious one, has already developed the dream out of the hidden dream-thoughts. The only mistake made by previous writers has been in supposing that the modification of the dream in the course of being remembered and put into words is an *arbitrary* one and cannot be further resolved and that it is therefore calculated to give us a misleading picture of the dream. They have underestimated the extent to which psychical events are determined. There is nothing arbitrary about them. It can be shown quite generally that if an element is left undetermined by one train of thought, its determination is immediately effected by a second one. For instance. I may try to think of a number arbitrarily. But this is impossible: the number that occurs to me will be unambiguously and necessarily determined by thoughts of mine, though they may be remote from my immediate intention.¹ The modifications to which dreams are submitted under the editorship of waking life are just as little arbitrary. They are associatively linked to the material which they replace, and serve to show us the way to that material, which may in its turn be a substitute for something else.

In analysing the dreams of my patients I sometimes put this assertion to the following test, which has never failed me. If the first account given me by a patient of a dream is too hard to follow I ask him to repeat it. In doing so he rarely uses the same words. But the parts of the dream which he describes in different terms are by that fact revealed to me as the weak spot in the dream's disguise: they serve my purpose just as Hagen's was served by the embroidered mark on Siegfried's cloak. That is the point at which the interpretation of the dream can be started. My request to the patient to repeat his account of the dream has warned him that I was proposing to take special pains in solving it; under pressure of the resistance, therefore, he hastily covers the weak spots in the dream's disguise by replacing any expressions that threaten to betray its meaning by other less revealing ones. In this way he draws my attention to the expression which he has dropped out. The trouble taken by the dreamer in preventing the solution of the dream gives me a basis for estimating the care with which its cloak has been woven.

¹ [Footnote added 1909:] See my *Psychopathology of Everyday Life*.

Previous writers have had less justification in devoting so much space to the *doubt* with which our judgement receives accounts of dreams. For this doubt has no intellectual warrant. There is in general no guarantee of the correctness of our memory; and yet we yield to the compulsion to attach belief to its data far more often than is objectively justified. Doubt whether a dream or certain of its details have been correctly reported is once more a derivative of the dream-censorship, of resistance to the penetration of the dream-thoughts into consciousness. This resistance has not been exhausted even by the displacements and substitutions it has brought about; it persists in the form of doubt attaching to the material which has been allowed through. We are especially inclined to misunderstand this doubt since it is careful never to attack the more intense elements of a dream but only the weak and indistinct ones. As we already know, however, a complete reversal of all psychical values takes place between the dream-thoughts and the dream. Distortion is only made possible by a withdrawal of psychical value; it habitually expresses itself by that means and is occasionally content to require nothing more. If, then, an indistinct element of a dream's content is in addition attacked by doubt, we have a sure indication that we are dealing with a comparatively direct derivative of one of the proscribed dream-thoughts. The state of things is what it was after some sweeping revolution in one of the republics of antiquity or the Renaissance. The noble and powerful families which had previously dominated the scene were sent into exile and all the high offices were filled by newcomers. Only the most impoverished and powerless members of the vanquished families, or their remote dependants, were allowed to remain in the city; and even so they did not enjoy full civic rights and were viewed with distrust. The distrust in this analogy corresponds to the doubt in the case we are considering. That is why in analysing a dream I insist that the whole scale of estimates of certainty shall be abandoned and that the faintest possibility that something of this or that sort may have occurred in the dream shall be treated as complete certainty. In tracing any element of a dream it will be found that unless this attitude is firmly adopted the analysis will come to a standstill. If any doubt is thrown upon the value of the element in question, the psychical result in the patient is that none of the involuntary ideas underlying that element comes into his head. This result is not a self-evident one. It would not make nonsense if someone were to say: 'I don't know for certain whether such and such a thing came into the dream, but here is what occurs to me in connection with it.' But in fact no one ever does say this; and it is precisely the fact that doubt produces this interrupting effect upon an analysis that reveals it as a derivative and tool of psychical resistance. Psycho-analysis is justly suspicious. One of its rules is that *whatever interrupts the progress of analytic work is a resistance*.¹

¹ [Footnote added 1925:] The proposition laid down in these peremptory terms - 'whatever interrupts the progress of analytic work is a resistance' is easily open to misunderstanding. It is of course only to be taken as a technical rule, as a warning to analysts. It cannot be disputed that in the course of an analysis various events may occur the responsibility for which cannot be laid upon the patient's intentions. His father may die without his having murdered him; or a war may break out which brings the analysis to an end. But behind its obvious exaggeration the proposition is asserting something both true and new. Even if the interrupting event is a real one and independent of the patient, it often depends on him how great an interruption it causes; and resistance shows itself unmistakably in the readiness with which he accepts an occurrence of this kind or the exaggerated use which he makes of it.

The *forgetting* of dreams, too, remains inexplicable unless the power of the psychical censorship is taken into account. In a number of cases the feeling of having dreamt a great deal during the night and of only having retained a little of it may in fact have some other meaning, such as that the dream-work has been perceptibly proceeding all through the night but has only left a short dream behind. It is no doubt true that we forget dreams more and more as time passes after waking; we often forget them in spite of the most painstaking efforts to recall them. But I am of opinion that the extent of this forgetting is as a rule overestimated; and there is a similar overestimation of the extent to which the gaps in a dream limit our knowledge of it. It is often possible by means of analysis to restore all that has been lost by the forgetting of the dream's content; at least, in quite a number of cases one can reconstruct from a single remaining fragment not, it is true, the dream - which is in any case a matter of no importance - but all the dream-thoughts. This demands a certain amount of attention and self-discipline in carrying out the analysis; that is all - but it shows that there was no lack of a hostile purpose at work in the forgetting of the dream.¹

¹ [Footnote added 1919:] I may quote the following dream from my *Introductory Lectures* as an example of the meaning of doubt and uncertainty in a dream and of its content being at the same time shrunk down to a single element; in spite of this the dream was successfully analysed after a short delay:

'A sceptical woman patient had a longish dream in the course of which some people told her about my book on jokes and praised it highly. Something came in then about a "channel", *perhaps it was another book that mentioned a channel, or something else about a channel . . . she didn't know . . . it was all so indistinct.*

'No doubt you will be inclined to expect that the element "channel," since it was so indistinct, would be inaccessible to interpretation. You are right in suspecting a difficulty; but the difficulty did not arise from the indistinctness: both the difficulty and the indistinctness arose from another cause. Nothing occurred to the dreamer in connection with "channel," and I could of course throw no light on it. A little later - it was the next day, in point of fact - she told me that she had thought of something that *might* have something to do with it. It was a joke, too - a joke she had heard. On the steamer between Dover and Calais a well-known author fell into conversation with an Englishman. The latter had occasion to quote the phrase: "Du sublime au ridicule il n'y a qu'un pas. [It is only a step from the sublime to the ridiculous.]" Yes, replied the author, "*le Pas de Calais*" - meaning that he thought France sublime and England ridiculous. But the *Pas de Calais* is a channel - the English Channel. You will ask whether I think this had anything to do with the dream. Certainly I think so; and it provides the solution of the puzzling element of the dream. Can you doubt that this joke was already present before the dream occurred, as the unconscious thought behind the element "channel"? Can you suppose that it was introduced as a subsequent invention? The association betrayed the scepticism which lay concealed behind the patient's ostensible admiration; and her resistance against revealing this was no doubt the common cause both of her delay in producing the association and of the indistinctness of the dream-element concerned. Consider the relation of the dream-element to its unconscious background: it was, as it were, a fragment of that background, an allusion to it, but it was made quite incomprehensible by being isolated.'

Convincing evidence of the fact that the forgetting of dreams is tendentious and serves the purpose of resistance¹ is afforded when it is possible to observe in analyses a preliminary stage of forgetting. It not infrequently happens that in the middle of the work of interpretation an omitted portion of the dream comes to light and is described as having been forgotten till that moment. Now a part of a dream that has been rescued from oblivion in this way is invariably the most important part; it always lies on the shortest road to the dream's solution and has for that reason been exposed to resistance more than any other part. Among the specimen dreams scattered through this volume, there is one in which a part of its content was added like this as an after-thought. It is the travel dream in which I revenged myself on two disagreeable fellow-travellers and which I had to leave almost uninterpreted on account of its gross indecency. The omitted portion ran as follows: *'I said, referring to one of Schiller's works: "It is from . . ." but, noticing the mistake, I corrected myself: "It is by . . ." "Yes", the man commented to his sister, "he said that right."'*²

¹ On the purposes of forgetting in general see my short paper on the psychical mechanism of forgetting (Freud, 1898*b*). [Added 1909:] Later included as the first chapter in my *Psychopathology of Everyday Life* (Freud, 1901*b*)

² [Footnote added 1914:] Corrections such as this in the usages of foreign languages are not infrequent in dreams but are more often attributed to other people. Maury (1878, 143) once dreamt, at a time when he was learning English, that, in telling someone that he had visited him the day before, he used the words 'I called for you yesterday.' Whereupon the other answered correctly: 'You should have said "I called on you yesterday".'

Self-corrections in dreams, which seem so marvellous to some writers, need not occupy our attention. I will indicate instead the recollection which served as the model for my verbal error in this dream. When I was nineteen years old I visited England for the first time and spent a whole day on the shore of the Irish Sea. I naturally revelled in the opportunity of collecting the marine animals left behind by the tide and I was occupied with a starfish - the words '*Hollthurn*' and '*holothurians* [sea-slugs]' occurred at the beginning of the dream - when a charming little girl came up to me and said: 'Is it a starfish? Is it alive?' 'Yes', I replied, 'he is alive', and at once, embarrassed at my mistake, repeated the sentence correctly ['It is alive']. The dream replaced the verbal error which I then made by another into which a German is equally liable to fall. '*Das Buch ist von Schiller*' should be translated not with a 'from' but with a 'by.' After all that we have heard of the purposes of the dream-work and its reckless choice of methods for attaining them, we shall not be surprised to hear that it effected this replacement because of the magnificent piece of condensation that was made possible by the identity of sound of the English 'from' and the German adjective '*fromm*' ['pious']. But how did my blameless memory of the sea-shore come to be in the dream? It served as the most innocent possible example of my using a word indicating gender or sex in the wrong place - of my bringing in sex (the word 'he') where it did not belong. This, incidentally, was one of the keys to the solution of the dream. No one who has heard, furthermore, the origin attributed to the title of Clerk-Maxwell's '*Matter and Motion*' will have any difficulty in filling in the gaps: *Moliere's 'Le Malade Imaginaire' - 'La matière est-elle laudable?'*¹ - A *motion* of the bowels.

¹ ['Is the matter laudable?' - Old medical terminology for 'Is the excretion healthy?' - The next phrase is in English in the original.]

Moreover I am in a position to offer an ocular demonstration of the fact that the forgetting of dreams is to a great extent a product of resistance. One of my patients will tell me he has had a dream but has forgotten every trace of it: it is therefore just as though it had never happened. We proceed with our work. I come up against a resistance; I therefore explain something to the patient and help him by encouragement and pressure to come to terms with some disagreeable thought. Hardly have I succeeded in this than he exclaims: 'Now I remember what it was I dreamt.' The same resistance which interfered with our work that day also made him forget the dream. By overcoming this resistance I have recalled the dream to his memory.

In just the same way, when a patient reaches some particular point in his work, he may be able to remember a dream which he had dreamt three or four or even more days before and which had hitherto remained forgotten.¹

Psycho-analytic experience has provided us with yet an other proof that the forgetting of dreams depends far more upon resistance than upon the fact, stressed by the authorities, that the waking and sleeping states are alien to each other. It not infrequently happens to me, as well as to other analysts and to patients under treatment, that, having been woken up, as one might say, by a dream, I immediately afterwards, and in full possession of my intellectual powers, set about interpreting it. In such cases I have often refused to rest till I have arrived at a complete understanding of the dream; yet it has sometimes been my experience that after finally waking up in the morning I have entirely forgotten both my interpretative activity and the content of the dream, though knowing that I have had a dream and interpreted it. It happens far more often that the dream draws the findings of my interpretative activity back with it into oblivion than that my intellectual activity succeeds in preserving the dream in my memory. Yet there is no such psychical gulf between my interpretative activity and my waking thoughts as the authorities suppose to account for the forgetting of dreams.

¹ [*Footnote added 1914:*] Ernest Jones has described an analogous case which often occurs: while a dream is being analysed the patient may recollect a second one which was dreamt during the same night but whose very existence had not been suspected.

Morton Prince (1910) has objected to my explanation of the forgetting of dreams on the ground that that forgetting is only a special case of the amnesia attaching to dissociated mental states, that it is impossible to extend my explanation of this special amnesia to other types and that my explanation is consequently devoid of value even for its immediate purpose. His readers are thus reminded that in the course of all his descriptions of these dissociated states he has never attempted to discover a dynamic explanation of such phenomena. If he had, he would inevitably have found that repression (or, more precisely, the resistance created by it) is the cause both of the dissociations and of the amnesia attaching to their psychical content.

An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysteric, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in *Studies on Hysteria* of the first hysterical attack which a woman of over forty had had in her fifteenth year.¹

¹ [Added in the text in 1919 and transferred to a footnote in 1930:] Dreams which occur in the earliest years of childhood and are retained in the memory for dozens of years, often with complete sensory vividness, are almost always of great importance in enabling us to understand the history of the subject's mental development and of his neurosis. Analysis of such dreams protects the physician from errors and uncertainties which may lead, among other things, to theoretical confusion.

And here I will mention a number of further, somewhat disconnected, points on the subject of interpreting dreams, which may perhaps help to give readers their bearings should they feel inclined to check my statements by subsequent work upon their own dreams.

No one should expect that an interpretation of his dreams will fall into his lap like manna from the skies. Practice is needed even for perceiving endoptic phenomena or other sensations from which our attention is normally withheld; and this is so even though there is no psychical motive fighting against such perceptions. It is decidedly more difficult to get hold of 'involuntary ideas.' Anyone who seeks to do so must familiarize himself with the expectations raised in the present volume and must, in accordance with the rules laid down in it, endeavour during the work to refrain from any criticism, any *parti pris*, and any emotional or intellectual bias. He must bear in mind Claude Bernard's advice to experimenters in a physiological laboratory: 'travailler comme une bête' - he must work, that is, with as much persistence as an animal and with as much disregard of the result. If this advice is followed, the task will no longer be a hard one.

The interpretation of a dream cannot always be accomplished at a single sitting. When we have followed a chain of associations, it not infrequently happens that we feel our capacity exhausted; nothing more is to be learnt from the dream that day. The wisest plan then is to break off and resume our work another day: another part of the dream's content may then attract our attention and give us access to another stratum of dream-thoughts. This procedure might be described as 'fractional' dream-interpretation.

It is only with the greatest difficulty that the beginner in the business of interpreting dreams can be persuaded that his task is not at an end when he has a complete interpretation in his hands - an interpretation which makes sense, is coherent and throws light upon every element of the dream's content. For the same dream may perhaps have another interpretation as well, an 'over-interpretation', which has escaped him. It is, indeed, not easy to form any conception of the abundance of the unconscious trains of thought, all striving to find expression, which are active in our minds. Nor is it easy to credit the skill shown by the dream-work in always hitting upon forms of expression that can bear several meanings - like the Little Tailor in the fairy story who hit seven flies at a blow. My readers will always be inclined to accuse me of introducing an unnecessary amount of ingenuity into my interpretations; but actual experience would teach them better.

On the other hand, I cannot confirm the opinion, first stated by Silberer, that all dreams (or many dreams, or certain classes of dreams) require two different interpretations, which are even stated to bear a fixed relation to each other. One of these interpretations, which Silberer calls the 'psycho-analytic' one, is said to give the dream some meaning or other, usually of an infantile-sexual kind; the other and more important interpretation, to which he gives the name of 'anagogic', is said to reveal the more serious thoughts, often of profound import, which the dream-work has taken as its material. Silberer has not given evidence in support of this opinion by reporting a series of dreams analysed in the two directions. And I must object that the alleged fact is non-existent. In spite of what he says, the majority of dreams require no 'over-interpretation' and, more particularly, are insusceptible to an anagogic interpretation. As in the case of many other theories put forward in recent years, it is impossible to overlook the fact that Silberer's views are influenced to some extent by a purpose which seeks to disguise the fundamental circumstances in which dreams are formed and to divert interest from their instinctual roots. In a certain number of cases I have been able to confirm Silberer's statements. Analysis showed that in such cases the dream-work found itself faced with the problem of transforming into a dream a series of highly abstract thoughts from waking life which were incapable of being given any direct representation. It endeavoured to solve the problem by getting hold of another group of intellectual material, somewhat loosely related (often in a manner which might be described as 'allegorical') to the abstract thoughts, and at the same time capable of being represented with fewer difficulties. The *abstract* interpretation of a dream that has arisen in this way is given by the dreamer without any difficulty; the *correct* interpretation of the material that has been interpolated must be looked for by the technical methods which are now familiar to us.

The question whether it is possible to interpret every dream must be answered in the negative. It must not be forgotten that in interpreting a dream we are opposed by the psychical forces which were responsible for its distortion. It is thus a question of relative strength whether our intellectual interest, our capacity for self-discipline, our psychological knowledge and our practice in interpreting dreams enable us to master our internal resistances. It is always possible to go *some* distance: far enough, at all events, to convince ourselves that the dream is a structure with a meaning, and as a rule far enough to get a glimpse of what that meaning is. Quite often an immediately succeeding dream allows us to confirm and carry further the interpretation we have tentatively adopted for its predecessor. A whole series of dreams, continuing over a period of weeks or months, is often based upon common ground and must accordingly be interpreted in connection with one another. In the case of two consecutive dreams it can often be observed that one takes as its central point something that is only on the periphery of the other and *vice versa*, so that their interpretations too are mutually complementary. I have already given instances which show that different dreams dreamt on the same night are, as a quite general rule, to be treated in their interpretation as a single whole.

There is often a passage in even the most thoroughly interpreted dream which has to be left obscure; this is because we become aware during the work of interpretation that at that point there is a tangle of dream-thoughts which cannot be unravelled and which moreover adds nothing to our knowledge of the content of the dream. This is the dream's navel, the spot where it reaches down into the unknown. The dream-thoughts to which we are led by interpretation cannot, from the nature of things, have any definite endings; they are found to branch out in every direction into the intricate network of our world of thought. It is at some point where this meshwork is particularly close that the dream-wish grows up, like a mushroom out of its mycelium.

But we must return to the facts concerning the forgetting of dreams, for we have failed to draw one important conclusion from them. We have seen that waking life shows an unmistakable inclination to forget any dream that has been formed in the course of the night - whether as a whole directly after waking, or bit by bit in the course of the day; and we have recognized that the agent chiefly responsible for this forgetting is the mental resistance to the dream which has already done what it could against it during the night. But if all this is so, the question arises how it comes about that a dream can be formed at all in the face of this resistance. Let us take the most extreme case, in which waking life has got rid of a dream as though it had never occurred. A consideration of the interplay of psychical forces in this case must lead us to infer that the dream would in fact not have occurred at all if the resistance had been as strong during the night as during the day. We must conclude that during the night the resistance loses some of its power, though we know it does not lose the whole of it, since we have shown the part it plays in the formation of dreams as a distorting agent. But we are driven to suppose that its power may be diminished at night and that this makes the formation of dreams possible. This makes it easy to understand how, having regained its full strength at the moment of waking, it at once proceeds to get rid of what it was obliged to permit while it was weak. Descriptive psychology tells us that the principal *sine qua non* for the formation of dreams is that the mind shall be in a state of sleep; and we are now able to explain this fact: *the state of sleep makes the formation of dreams possible because it reduces the power of the endopsychic censorship.*

It is no doubt tempting to regard this as the only possible inference that can be drawn from the facts of the forgetting of dreams, and to make it the basis for further conclusions as to the conditions of energy prevailing during sleeping and waking. For the moment, however, we will stop at this point. When we have entered a little more deeply into the psychology of dreams we shall find that the factors making possible the formation of dreams can be viewed in another way as well. It may be that the resistance against the dream-thoughts becoming conscious can be evaded without any reduction having taken place in its power. And it seems a plausible idea that *both* of the two factors favouring the formation of dreams - the reduction and the evasion of the resistance - are simultaneously made possible by the state of sleep. I will break off here, though I shall pick up the argument again presently.

There is another set of objections to our method of interpreting dreams with which we must now deal. Our procedure consists in abandoning all those purposive ideas which normally govern our reflections, in focusing our attention on a single element of the dream and in then taking note of whatever involuntary thoughts may occur to us in connection with it. We then take the next portion of the dream and repeat the process with *it*. We allow ourselves to be led on by our thoughts regardless of the direction in which they carry us and drift on in this way from one thing to another. But we cherish a confident belief that in the end, without any active intervention on our part, we shall arrive at the dream-thoughts from which the dream originated.

Our critics argue against this along the following lines. There is nothing wonderful in the fact that a single element of the dream should lead us *somewhere*; every idea can be associated with *something*. What is remarkable is that such an aimless and arbitrary train of thought should happen to bring us to the dream-thoughts. The probability is that we are deceiving ourselves. We follow a chain of associations from one element, till, for one reason or another, it seems to break off. If we then take up a second element, it is only to be expected that the originally unrestricted character of our associations will be narrowed. For we still have the earlier chain of thoughts in our memory, and for that reason, in analysing the second dream-idea, we are more likely to hit upon associations which have something in common with associations from the first chain. We then delude ourselves into thinking that we have discovered a thought which is a connecting point between two elements of the dream. Since we give ourselves complete liberty to connect thoughts as we please and since in fact the only transitions from one idea to another which we exclude are those which operate in normal thinking, we shall find no difficulty in the long run in concocting out of a number of 'intermediate thoughts' something which we describe as the dream-thoughts and which - though without any guarantee, since we have no other knowledge of what the dream-thoughts are - we allege to be the psychical substitute for the dream. But the whole thing is completely arbitrary; we are merely exploiting chance connections in a manner which gives an effect of ingenuity. In this way anyone who cares to take such useless pains can worry out any interpretation he pleases from any dream.

If we were in fact met by objections such as these, we might defend ourselves by appealing to the impression made by our interpretations, to the surprising connections with other elements of the dream which emerge in the course of our pursuing a single one of its ideas, and to the improbability that anything which gives such an exhaustive account of the dream could have been arrived at except by following up psychical connections which had already been laid down. We might also point out in our defence that our procedure in interpreting dreams is identical with the procedure by which we resolve hysterical symptoms;; and there the correctness of our method is warranted by the coincident emergence and disappearance of the symptoms, or, to use a simile, the assertions made in the text are borne out by the accompanying illustrations. But we have no reason for evading the problem of how it is possible to reach a pre-existing goal by following the drift of an arbitrary and purposeless chain of thoughts; since, though we may not be able to solve the problem, we can completely cut the ground from under it.

For it is demonstrably untrue that we are being carried along a purposeless stream of ideas when, in the process of interpreting a dream, we abandon reflection and allow involuntary ideas to emerge. It can be shown that all that we can ever get rid of are purposive ideas that are *known* to us; as soon as we have done this, *unknown* - or, as we inaccurately say, 'unconscious' - purposive ideas take charge and thereafter determine the course of the involuntary ideas. No influence that we can bring to bear upon our mental processes can ever enable us to think without purposive ideas; nor am I aware of any states of psychical confusion which can do so.¹ Psychiatrists have been far too ready in this respect to abandon their belief in the connectedness of psychical processes. I know for a fact that trains of thought without purposive ideas no more occur in hysteria and paranoia than they do in the formation or resolution of dreams. It may be that they do not occur in any of the endogenous psychical disorders. Even the deliria of confusional states may have a meaning, if we are to accept Leuret's brilliant suggestion that they are only unintelligible to us owing to the gaps in them. I myself have formed the same opinion when I have had the opportunity of observing them. Deliria are the work of a censorship which no longer takes the trouble to conceal its operation; instead of collaborating in producing a new version that shall be unobjectionable, it ruthlessly deletes whatever it disapproves of, so that what remains becomes quite disconnected. This censorship acts exactly like the censorship of newspapers at the Russian frontier, which allows foreign journals to fall into the hands of the readers whom it is its business to protect only after a quantity of passages have been blacked out.

¹ [Footnote added 1914:] It was not until later that my attention was drawn to the fact that Eduard von Hartmann takes the same view on this important matter of psychology: 'In discussing the part played by the unconscious in artistic creation, Eduard von Hartmann (1890, 1, Section B, Chapter V) made a clear statement of the law in accordance with which the association of ideas is governed by unconscious purposive ideas, though he was unaware of the scope of the law. He set out to prove that "every combination of sensuous presentations, when it is not left purely to chance, but is led to a definite end, requires the help of the unconscious", and that the part played by conscious interest is to stimulate the unconscious to select the most appropriate idea among the countless possible ones. It is the unconscious which makes the appropriate selection of a purpose for the interest and this "holds good of the association of ideas in abstract thinking as well as in sensuous imagining and artistic combination" and in the production of jokes. For this reason a limitation of the association of ideas to an exciting idea and an excited idea (in the sense of a pure association psychology) can not be upheld. Such a limitation could be justified "only if there are conditions in human life in which man is free not only from every conscious purpose, but also from the sway or co-operation of every unconscious interest, every passing mood. This is, however, a condition hardly ever occurring, for even if one in appearance completely abandons his train of thought to accident, or if one abandons oneself entirely to the involuntary dreams of fancy, yet always other leading interests, dominant feelings and moods prevail at one time rather than at another, and these will always exert an influence on the association of ideas." "In semi-conscious dreams always only such ideas as correspond to the main interest of the moment occur." The emphasis thus laid upon the influence of feelings and moods on the free sequence of thoughts make it possible to justify the methodological procedure of psycho-analysis completely from the standpoint of Hartmann's psychology.' (Pohorilles, 1913.) - Du Prel (1885, 107) refers to the fact that after we have vainly tried to recall a name, it often comes into our heads again suddenly and without any warning. He concludes from this that unconscious but none the less purposeful thinking has taken place and that its result has suddenly entered consciousness.

It may be that free play of ideas with a fortuitous chain of associations is to be found in destructive organic cerebral processes; what is regarded as such in the psychoneuroses can always be explained as an effect of the censorship's influence upon a train of thought which has been pushed into the foreground by purposive ideas that have remained hidden.¹ It has been regarded as an unfailing sign of an association being uninfluenced by purposive ideas if the associations (or images) in question seem to be interrelated in what is described as a 'superficial' manner - by assonance, verbal ambiguity, temporal coincidence without connection in meaning, or by any association of the kind that we allow in jokes or in play upon words. This characteristic is present in the chains of thought which lead from the elements of a dream to the intermediate thoughts and from these to the dream-thoughts proper; we have seen instances of this - not without astonishment - in many dream-analyses. No connection was too loose, no joke too bad, to serve as a bridge from one thought to another. But the true explanation of this easy-going state of things is soon found. *Whenever one psychical element is linked with another by an objectionable or superficial association, there is also a legitimate and deeper link between them which is subjected to the resistance of the censorship.*

The real reason for the prevalence of superficial associations is not the abandonment of purposive ideas but the pressure of the censorship. Superficial associations replace deep ones if the censorship makes the normal connecting paths impassable. We may picture, by way of analogy, a mountain region, where some general interruption of traffic (owing to floods, for instance) has blocked the main, major roads, but where communications are still maintained over inconvenient and steep footpaths normally used only by the hunter.

¹ [Footnote added 1909:] This assertion has received striking confirmation from C. G. Jung's analyses in cases of dementia praecox. (Jung, 1907.)

Two cases may here be distinguished, though in essence they are the same. In the first of these, the censorship is directed only against the *connection* between two thoughts, which are unobjectionable separately. If so, the two thoughts will enter consciousness in succession; the connection between them will remain concealed, but, instead, a superficial link between them will occur to us, of which we should otherwise never have thought. This link is usually attached to some part of the complex of ideas quite other than that on which the suppressed and essential connection is based. The second case is where the two thoughts are in themselves subject to censorship on account of their content. If so, neither of them appears in its true shape but only in a modified one which replaces it; and the two replacing thoughts are chosen in such a way that they have a superficial association that repeats the essential connection which relates the two thoughts that have been replaced. *In both these cases the pressure of the censorship has resulted in a displacement from a normal and serious association to a superficial and apparently absurd one.*

Since we are aware that displacements of this kind occur, we have no hesitation when we are interpreting dreams in relying upon superficial associations as much as upon others.¹

In the psycho-analysis of neuroses the fullest use is made of these two theorems - that, when conscious purposive ideas are abandoned, concealed purposive ideas assume control of the current of ideas, and that superficial associations are only substitutes by displacement for suppressed deeper ones. Indeed, these theorems have become basic pillars of psycho-analytic technique. When I instruct a patient to abandon reflection of any kind and to tell me whatever comes into his head, I am relying firmly on the presumption that he will not be able to abandon the purposive ideas inherent in the treatment and I feel justified in inferring that what seem to be the most innocent and arbitrary things which he tells me are in fact related to his illness. There is another purposive idea of which the patient has no suspicion - one relating to myself. The full estimate of the importance of these two theorems, as well as more detailed information about them, fall within the province of an account of the technique of psycho-analysis. Here, then, we have reached one of the frontier posts at which, in accordance with our programme, we must drop the subject of dream-interpretation.²

¹ The same considerations apply equally, of course, to cases in which the superficial associations appear openly in the content of the dream, as, for instance, in the two dreams of Maury's quoted above on page 59. (*Pélerinage* - *Pelletier* - *pelle*; *kilomètre* - *kilogramme* - *Gilolo* - *Lobelia* - *Lopez* - *lotto*.) My work with neurotic patients has taught me the nature of the memories of which this is a favourite method of representation. They are occasions on which the subject has turned over the pages of encyclopaedias or dictionaries in order (like most people at the inquisitive age of puberty) to satisfy their craving for an answer to the riddles of sex.

² [Footnote added 1909:] These two theorems, which sounded most unpalatable at the time they were made, have since been experimentally employed and confirmed by Jung and his pupils in their studies in word association.

There is one true conclusion that we may glean from these objections, namely that we need not suppose that every association that occurs during the work of interpretation had a place in the dream-work during the night. It is true that in carrying out the interpretation in the waking state we follow a path which leads back from the elements of the dream to the dream-thoughts and that the dream-work followed one in the contrary direction. But it is highly improbable that these paths are passable both ways. It appears, rather, that in the daytime we drive shafts which follow along fresh chains of thought and that these shafts make contact with the intermediate thoughts and the dream-thoughts now at one point and now at another. We can see how in this manner fresh daytime material inserts itself into the interpretative chains. It is probable, too, that the increase in resistance that has set in since the night makes new and more devious detours necessary. The number and nature of the collaterals that we spin in this way during the day is of no psychological importance whatever, so long as they lead us to the dream-thoughts of which we are in search.

(B)

REGRESSION

Having now repelled the objections that have been raised against us, or having at least indicated where our defensive weapons lie, we must no longer postpone the task of setting about the psychological investigations for which we have so long been arming ourselves. Let us summarize the principal findings of our enquiry so far as it has gone. Dreams are psychical acts of as much significance as any others; their motive force is in every instance a wish seeking fulfilment; the fact of their not being recognizable as wishes and their many peculiarities and absurdities are due to the influence of the psychical censorship to which they have been subjected during the process of their formation; apart from the necessity of evading this censorship, other factors which have contributed to their formation are a necessity for the condensation of their psychical material, a regard for the possibility of its being represented in sensory images and - though not invariably - a demand that the structure of the dream shall have a rational and intelligible exterior. Each of these propositions opens a way to fresh psychological postulates and speculations; the mutual relations between the wish which is the dream's motive force and the four conditions to which the dream's formation is subject, as well as the interrelations between the latter, require to be investigated; and the place of dreams in the nexus of mental life has to be assigned.

It was with a view to reminding us of the problems which have still to be solved that I opened the present chapter with an account of a dream. There was no difficulty in interpreting that dream - the dream of the burning child - even though its interpretation was not given fully in our sense. I raised the question of why the dreamer dreamt it at all instead of waking up, and recognized that one of his motives was a wish to represent his child as still alive. Our further discussions will show us that yet another wish also played a part. Thus it was in the first instance for the sake of fulfilling a wish that the process of thought during sleep was transformed into a dream.

If we eliminate the wish-fulfilment, we shall see that only one feature is left to distinguish the two forms of psychical event. The dream-thought would have run: 'I see a glare coming from the room where the dead body is lying. Perhaps a candle has fallen over and my child may be burning.' The dream repeated these reflections unaltered, but it represented them in a situation which was actually present and which could be perceived through the senses like a waking experience. Here we have the most general and the most striking psychological characteristic of the process of dreaming: a thought, and as a rule a thought of something that is wished, is objectified in the dream, is represented as a scene, or, as it seems to us, is experienced.

How, then, are we to explain this characteristic peculiarity of the dream-work, or, to put the question more modestly, how are we to find a place for it in the nexus of psychical processes?

If we look into the matter more closely we shall observe that two almost independent features stand out as characteristic of the form taken by this dream. One is the fact that the thought is represented as an immediate situation with the 'perhaps' omitted, and the other is the fact that the thought is transformed into visual images and speech.

In this particular dream the change made in the thoughts by the conversion of the expectation expressed by them into the present tense may not seem particularly striking. This is because of what can only be described as the unusually subordinate part played in this dream by wish-fulfilment. Consider instead another one, in which the dream-wish was not detached from the waking thoughts that were carried over into sleep - for instance, the dream of Irma's injection. There the dream-thought that was represented was in the optative: 'If only Otto were responsible for Irma's illness!' The dream repressed the optative and replaced it by a straightforward present: 'Yes, Otto is responsible for Irma's illness.' This, then, is the first of the transformations which is brought about in the dream-thoughts even by a distortionless dream. We need not linger long over this first peculiarity of dreams. We can deal with it by drawing attention to conscious phantasies - to day-dreams - which treat their ideational content in just the same manner. While Daudet's Monsieur Joyeuse was wandering, out of work, through the streets of Paris (though his daughters believed that he had a job and was sitting in an office), he was dreaming of developments that might bring him influential help and lead to his finding employment - and he was dreaming in the present tense. Thus dreams make use of the present tense in the same manner and by the same right as day-dreams. The present tense is the one in which wishes are represented as fulfilled.

But dreams differ from day-dreams in their second characteristic: namely, in the fact of their ideational content being transformed from thoughts into sensory images, to which belief is attached and which appear to be experienced. I must add at once that not every dream exhibits this transformation from idea into sensory image. There are dreams which consist only of thoughts but which cannot on that account be denied the essential nature of dreams. My 'Autodidasker' dream was of that kind; it included scarcely more sensory elements than if I had thought its content in the daytime. And in every dream of any considerable length there are elements which have not, like the rest, been given a sensory form, but which are simply thought or known, in the kind of way in which we are accustomed to think or know things in waking life. It should also be remembered here that it is not only in dreams that such transformations of ideas into sensory images occur: they are also found in hallucinations and visions, which may appear as independent entities, so to say, in health or as symptoms in the psychoneuroses. In short, the relation which we are examining now is not in any respect an exclusive one. Nevertheless it remains true that it would be impossible for us to imagine the dream-world without it. But in order to arrive at an understanding of it we must embark upon a discussion that will take us far afield.

As the starting-point for our enquiry, I should like to pick out one from among many remarks made upon the theory of dreaming by those who have written on the subject. In the course of a short discussion on the topic of dreams, the great Fechner (1889, 2, 520-1) puts forward the idea that *the scene of action of dreams is different from that of waking ideational life*. This is the only hypothesis that makes the special peculiarities of dream-life intelligible.

What is presented to us in these words is the idea of *psychical locality*. I shall entirely disregard the fact that the mental apparatus with which we are here concerned is also known to us in the form of an anatomical preparation, and I shall carefully avoid the temptation to determine psychical locality in any anatomical fashion. I shall remain upon psychological ground, and I propose simply to follow the suggestion that we should picture the instrument which carries out our mental functions as resembling a compound microscope or a photographic apparatus, or something of the kind. On that basis, psychical locality will correspond to a point inside the apparatus at which one of the preliminary stages of an image comes into being. In the microscope and telescope, as we know, these occur in part at ideal points, regions in which no tangible component of the apparatus is situated. I see no necessity to apologize for the imperfections of this or of any similar imagery. Analogies of this kind are only intended to assist us in our attempt to make the complications of mental functioning intelligible by dissecting the function and assigning its different constituents to different component parts of the apparatus. So far as I know, the experiment has not hitherto been made of using this method of dissection in order to investigate the way in which the mental instrument is put together, and I can see no harm in it. We are justified, in my view, in giving free rein to our speculations so long as we retain the coolness of our judgement and do not mistake the scaffolding for the building. And since at our first approach to something unknown all that we need is the assistance of provisional ideas, I shall give preference in the first instance to hypotheses of the crudest and most concrete description.

Accordingly, we will picture the mental apparatus as a compound instrument, to the components of which we will give the name of 'agencies', or (for the sake of greater clarity) 'systems.' It is to be anticipated, in the next place, that these systems may perhaps stand in a regular spatial relation to one another, in the same kind of way in which the various systems of lenses in a telescope are arranged behind one another. Strictly speaking there is no need for the hypothesis that the psychical systems are actually arranged in a *spatial* order. It would be sufficient if a fixed order were established by the fact that in a given psychical process the excitation passes through the systems in a particular *temporal* sequence. In other processes the sequence may perhaps be a different one; that is a possibility that we shall leave open. For the sake of brevity we will in future speak of the components of the apparatus as ' Ψ -systems.'

The first thing that strikes us is that this apparatus, compounded of Ψ -systems, has a sense or direction. All our psychical activity starts from stimuli (whether internal or external) and ends in innervations. Accordingly, we shall ascribe a sensory and a motor end to the apparatus. At the sensory end there lies a system which receives perceptions; at the motor end there lies another, which opens the gateway to motor activity. Psychical processes advance in general from the perceptual end to the motor end. Thus the most general schematic picture of the psychical apparatus may be represented thus (Fig. 1):

Fig. 1.

This, however, does no more than fulfil a requirement with which we have long been familiar, namely that the psychical apparatus must be constructed like a reflex apparatus. Reflex processes remain the model of every psychical function.

Next, we have grounds for introducing a first differentiation at the sensory end. A trace is left in our psychical apparatus of the perceptions which impinge upon it. This we may describe as a 'memory-trace'; and to the function relating to it we give the name of 'memory.' If we are in earnest over our plan of attaching psychical processes to systems, memory-traces can only consist in permanent modifications of the elements of the systems. But, as has already been pointed out elsewhere, there are obvious difficulties involved in supposing that one and the same system can accurately retain modifications of its elements and yet remain perpetually open to the reception of fresh occasions for modification. In accordance, therefore, with the principle which governs our experiment, we shall distribute these two functions on to different systems. We shall suppose that a system in the very front of the apparatus receives the perceptual stimuli but retains no trace of them and thus has no memory, while behind it there lies a second system which transforms the momentary excitations of the first system into permanent traces. The schematic picture of our psychical apparatus would then be as follows (Fig. 2):

Fig. 2.

It is a familiar fact that we retain permanently something more than the mere *content* of the perceptions which impinge upon the system *Pcpt.* Our perceptions are linked with one another in our memory - first and foremost according to simultaneity of occurrence. We speak of this fact as 'association.' It is clear, then, that, if the *Pcpt.* system has no memory whatever it cannot retain any associative traces; the separate *Pcpt.* elements would be intolerably obstructed in performing their function if the remnant of an earlier connection were to exercise an influence upon a fresh perception. We must therefore assume the basis of association lies in the mnemic systems. Association would thus consist in the fact that, as a result of a diminution in resistances and of the laying down of facilitating paths, an excitation is transmitted from a given *Mnem.* element more readily to one *Mnem.* element than to another.

Closer consideration will show the necessity for supposing the existence not of one but of several such *Mnem.* elements, in which one and the same excitation, transmitted by the *Pcpt.* elements, leaves a variety of different permanent records. The first of these *Mnem.* systems will naturally contain the record of association in respect to *simultaneity in time*; while the same perceptual material will be arranged in the later systems in respect to other kinds of coincidence, so that one of these later systems, for instance, will record relations of similarity, and so on with the others. It would of course be a waste of time to try to put the psychical significance of a system of this kind into words. Its character would lie in the intimate details of its relations to the different elements of the raw material of memory, that is - if we may hint at a theory of a more radical kind - in the degrees of conductive resistance which it offered to the passage of excitation from those elements.

At this point I will interpolate a remark of a general nature which may perhaps have important implications. It is the *Pcpt.* system, which is without the capacity to retain modifications and is thus without memory, that provides our consciousness with the whole multiplicity of sensory qualities. On the other hand, our memories - not excepting those which are most deeply stamped on our minds - are in themselves unconscious. They can be made conscious; but there can be no doubt that they can produce all their effects while in an unconscious condition. What we describe as our 'character' is based on the memory-traces of our impressions; and, moreover, the impressions which have had the greatest effect on us - those of our earliest youth - are precisely the ones which scarcely ever become conscious. But if memories become conscious once more they exhibit no sensory quality or a very slight one in comparison with perceptions. A most promising light would be thrown on the conditions governing the excitation of neurone if it could be confirmed that *the Ψ -systems of memory and the quality that characterizes consciousness are mutually exclusive.*¹

¹ [Footnote added 1925:] I have since suggested that consciousness actually arises *instead of* the memory-trace. See my 'Note upon the "Mystic Writing-Pad"' (1925a).

The assumptions we have so far put forward as to the construction of the psychical apparatus at its sensory end have been made without reference to dreams or to the psychological information that we have been able to infer from them. Evidence afforded by dreams will, however, help us towards understanding another portion of the apparatus. We have seen that we were only able to explain the formation of dreams by venturing upon the hypothesis of there being two psychical agencies, one of which submitted the activity of the other to a criticism which involved its exclusion from consciousness. The critical agency, we concluded, stands in a closer relation to consciousness than the agency criticized: it stands like a screen between the latter and consciousness. Further we found reasons for identifying the critical agency with the agency which directs our waking life and determines our voluntary, conscious actions. If, in accordance with our assumptions, we replace these agencies by systems, then our last conclusion must lead us to locate the critical system at the motor end of the apparatus. We will now introduce the two system into our schematic picture and give them names to express their relation to consciousness (Fig. 3):

Fig. 3.

We will describe the last of the systems at the motor end as 'the preconscious', to indicate that the excitatory processes occurring in it can enter consciousness without further impediment provided that certain other conditions are fulfilled: for instance, that they reach a certain degree of intensity, that the function which can only be described as 'attention' is distributed in a particular way, and so on. This is at the same time the system which holds the key to voluntary movement. We will describe the system that lies behind it as 'the unconscious', because it has no access to consciousness *except via the preconscious*, in passing through which its excitatory process is obliged to submit to modifications.¹

In which of these systems, then, are we to locate the impetus to the construction of dreams? For simplicity's sake, in the system *Ucs*. It is true that in the course of our future discussion we shall learn that this is not entirely accurate, and that the process of forming dreams is obliged to attach itself to dream-thoughts belonging to the preconscious system. But when we consider the dream-wish, we shall find that the motive force for producing dreams is supplied by the *Ucs*.; and owing to this latter factor we shall take the unconscious system as the starting-point of dream-formation. Like all other thought structures, this dream-instigator will make an effort to advance into the *Pcs*. and from there to obtain access to consciousness.

¹ [*Footnote added 1919:*] If we attempted to proceed further with this schematic picture, in which the systems are set out in linear succession, we should have to reckon with the fact that the system next beyond the *Pcs*. is the one to which consciousness must be ascribed - in other words, that *Pcpt.* = *Cs*.

Experience shows us that this path leading through the preconscious to consciousness is barred to the dream-thoughts during the daytime by the censorship imposed by resistance. During the night they are able to obtain access to consciousness; but the question arises as to how they do so and thanks to what modification. If what enabled the dream-thoughts to achieve this were the fact that at night there is a lowering of the resistance which guards the frontier between the unconscious and the preconscious, we should have dreams which were in the nature of ideas and which were without the hallucinatory quality in which we are at the moment interested. Thus the lowering of the censorship between the two systems *Ucs.* and *Pcs.* can only explain dreams formed like 'Autodidasker' and not dreams like that of the burning child which we took as the starting-point of our investigations.

The only way in which we can describe what happens in hallucinatory dreams is by saying that the excitation moves in a *backward* direction. Instead of being transmitted towards the *motor* end of the apparatus it moves towards the *sensory* end and finally reaches the perceptual system. If we describe as 'progressive' the direction taken by psychical processes arising from the unconscious during waking life, then we may speak of dreams as having a 'regressive' character.¹

¹ [Footnote added 1914:] The first hint at the factor of regression is to be found as far back as in Albertus Magnus. The '*imaginatio*', he tells us, constructs dreams out of the stored-up images of sensory objects; and the process is carried out in a reverse direction to that in waking life. (Quoted by Diepgen, 1912, 14.) - Hobbes writes in the *Leviathan* (1651, Pt. I, Chapter 2): 'In sum, our dreams are the reverse of our waking imaginations, the motion, when we are awake, beginning at one end, and when we dream at another.' (Quoted by Havelock Ellis, 1911, 109.)

This regression, then, is undoubtedly one of the psychological characteristics of the process of dreaming; but we must remember that it does not occur only in dreams. Intentional recollection and other constituent processes of our normal thinking involve a retrogressive movement in the psychical apparatus from a complex ideational act back to the raw material of the memory-traces underlying it. In the waking state, however, this backward movement never extends beyond the mnemonic images; it does not succeed in producing a hallucinatory revival of the *perceptual* images. Why is it otherwise in dreams? When we were considering the work of condensation in dreams we were driven to suppose that the intensities attaching to ideas can be completely transferred by the dream-work from one idea to another. It is probably this alteration in the normal psychical procedure which makes possible the cathexis of the system *Pcpt.* in the reverse direction, starting from thoughts, to the pitch of complete sensory vividness.

We must not delude ourselves into exaggerating the importance of these considerations. We have done no more than give a name to an inexplicable phenomenon. We call it 'regression' when in a dream an idea is turned back into the sensory image from which it was originally derived. But even this step requires justification. What is the point of this nomenclature if it teaches us nothing new? I believe the name 'regression' is of help to us in so far as it connects a fact that was already known to us with our schematic picture, in which the mental apparatus was given a sense or direction. And it is at this point that that picture begins to repay us for having constructed it. For an examination of it, without any further reflection, reveals a further characteristic of dream-formation. If we regard the process of dreaming as a regression occurring in our hypothetical mental apparatus, we at once arrive at the explanation of the empirically established fact that all the logical relations belonging to the dream-thoughts disappear during the dream-activity or can only find expression with difficulty. According to our schematic picture, these relations are contained not in the *first Mnem.* systems but in *later* ones; and in case of regression they would necessarily lose any means of expression except in perceptual images. *In regression the fabric of the dream-thoughts is resolved into its raw material.*

What modification is it that renders possible a regression which cannot occur in daytime? We must be content with some conjectures on this point. No doubt it is a question of changes in the cathexes of energy attaching to the different systems, changes which increase or diminish the facility with which those systems can be passed through by the excitatory process. But in any apparatus of this kind the same results upon the passage of excitations might be produced in more than one way. Our first thoughts will of course be of the state of sleep and the changes in cathexis which it brings about at the sensory end of the apparatus. During the day there is a continuous current from the *Pcpt. Ψ* -system flowing in the direction of motor activity; but this current ceases at night and could no longer form an obstacle to a current of excitation flowing in the opposite sense. Here we seem to have the 'shutting-out of the external world', which some authorities regard as the theoretical explanation of the psychological characteristics of dreams. (See p. 560.)

In explaining regression in dreams, however, we must bear in mind the regressions which also occur in pathological waking states; and here the explanation just given leaves us in the lurch. For in those cases regression occurs in spite of a sensory current flowing without interruption in a forward direction. My explanation of hallucinations in hysteria and paranoia and of visions in mentally normal subjects is that they are in fact regressions - that is, thoughts transformed into images - but that the only thoughts that undergo this transformation are those which are intimately linked with memories that have been suppressed or have remained unconscious.

For instance, one of my youngest hysterical patients, a twelve-year-old boy, was prevented from falling asleep by '*green faces with red eyes*' which terrified him. The source of this phenomenon was a suppressed, though at one time conscious, memory of a boy whom he had often seen four years earlier. This boy had presented him with an alarming picture of the consequences of bad habits in children, including masturbation - a habit with which my patient was now reproaching himself in retrospect. His mother had pointed out at the time that the ill-behaved boy had a *greenish face* and *red* (i.e. red-rimmed) eyes. Here was the origin of his bogey, whose only purpose, incidentally, was to remind him of another of his mother's predictions - that boys of that sort grow into idiots, can learn nothing at school and die young. My little patient had fulfilled one part of the prophecy, for he was making no progress at his school, and, as was shown from his account of the involuntary thoughts that occurred to him, he was terrified of the other part. I may add that after a short time the treatment resulted in his being able to sleep, in his nervousness disappearing and his being awarded a mark of distinction at the end of his school-year.

In the same connection I will give the explanation of a vision that was described to me by another hysterical patient (a woman of forty) as having happened before she fell ill. One morning she opened her eyes and saw her brother in the room, though, as she knew, he was in fact in an insane asylum. Her small son was sleeping in the bed beside her. To save the child from having a *fright* and *falling into convulsions* when he saw his *uncle*, she pulled the *sheet* over his face, whereupon the apparition vanished. This vision was a modified version of a memory from the lady's childhood; and, though it was conscious, it was intimately related to all the unconscious material in her mind. Her nurse had told her that her mother (who had died very young, when my patient was only eighteen months old) had suffered from epileptic or hysterical *convulsions*, which went back to a *fright* caused by her brother (my patient's uncle) appearing to her disguised as a ghost with a *sheet* over his head. Thus the vision contained the same elements as the memory: the brother's appearance, the sheet, the fright and its results. But the elements had been arranged in a different context and transferred on to other figures. The obvious motive of the vision, or of the thoughts which it replaced, was her concern lest her little boy might follow in the footsteps of his uncle, whom he greatly resembled physically.

The two instances that I have quoted are neither of them entirely devoid of connection with the state of sleep and for that reason are perhaps not well chosen for what I want them to prove. I will therefore refer the reader to my analysis of a woman suffering from hallucinatory paranoia (Freud, 1896*b*) as well as to the findings in my still unpublished studies on the psychology of the psychoneuroses, for evidence that in such instances of the regressive transformation of thoughts we must not overlook the influence of memories, mostly from childhood, which have been suppressed or have remained unconscious. The thoughts which are connected with a memory of this kind and which are forbidden expression by the censorship are, as it were, attracted by the memory into regression as being the form of representation in which the memory itself is couched. I may also recall that one of the facts arrived at in the *Studies on Hysteria* was that when it was possible to bring infantile scenes (whether they were memories or phantasies) into consciousness, they were seen like hallucinations and lost that characteristic only in the process of being reported. It is moreover a familiar observation that, even in those whose memory is not normally of a visual type, the earliest recollections of childhood retain far into life the quality of sensory vividness.

If we now bear in mind how great a part is played in the dream-thoughts by infantile experiences or by phantasies based upon them, how frequently portions of them re-emerge in the dream-content and how often the dream-wishes themselves are derived from them, we cannot dismiss the probability that in dreams too the transformation of thoughts into visual images may be in part the result of the attraction which memories couched in visual form and eager for revival bring to bear upon thoughts cut off from consciousness and struggling to find expression. On this view a dream might be described as *a substitute for an infantile scene modified by being transferred on to a recent experience*. The infantile scene is unable to bring about its own revival and has to be content with returning as a dream.

This indication of the way in which infantile scenes (or their reproductions as phantasies) function in a sense as models for the content of dreams, removes the necessity for one of the hypotheses put forward by Scherner and his followers in regard to internal sources of stimulation. Scherner supposes that, when dreams exhibit particularly vivid or particularly copious visual elements, there is present a state of 'visual stimulation', that is, of internal excitation in the organ of vision. We need not dispute this hypothesis, but can content ourselves with assuming that this state of excitation applies merely to the *psychical* perceptual system of the visual organ; we may, however, further point out that the state of excitation has been set up by a *memory*, that it is a *revival* of a visual excitation which was originally an immediate one. I cannot produce any good example from my own experience of an *infantile* memory producing this kind of result. My dreams are in general less rich in sensory elements than I am led to suppose is the case in other people. But in the case of my most vivid and beautiful dream of the last few years I was easily able to trace back the hallucinatory clarity of the dream's content to the sensory qualities of recent or fairly recent impressions. On p. 907 ff. I recorded a dream in which the deep blue colour of the water, the brown of the smoke coming from the ship's funnels, and the dark brown and red of the buildings left behind a profound impression on me. This dream, if any, should be traceable, to a visual stimulus. What was it that had brought my visual organ into this state of stimulation? A recent impression, which attached itself to a number of earlier ones. The colours which I saw were in the first instance those of a box of toy bricks with which, on the day before the dream, my children had put up a fine building and shown it off for my admiration. The big bricks were of the same dark red and the small ones were of the same blue and brown. This was associated with colour impressions from my last travels in Italy: the beautiful blue of the Isonzo and the lagoons and the brown of the Carso. The beauty of the colours in the dream was only a repetition of something seen in my memory.

Let us bring together what we have found out about the peculiar propensity of dreams to recast their ideational content into sensory images. We have not explained this feature of the dream-work, we have not traced it back to any known psychological laws; but we have rather picked it out as something that suggests unknown implications and we have characterized it with the word 'regressive.' We have put forward the view that in all probability this regression, wherever it may occur, is an effect of a resistance opposing the progress of a thought into consciousness along the normal path, and of a simultaneous attraction exercised upon the thought by the presence of memories possessing great sensory force.¹ In the case of dreams, regression may perhaps be further facilitated by the cessation of the progressive current - which streams in during the daytime from the sense organs; in other forms of regression, the absence of this accessory factor must be made up for by a greater intensity of the other motives for regression. Nor must we forget to observe that in these pathological cases of regression as well as in dreams the process of transference of energy must differ from what it is in regressions occurring in normal mental life, since in the former cases that process makes possible a complete hallucinatory cathexis of the perceptual systems. What we have described, in our analysis of the dream-work, as 'regard for representability' might be brought into connection with the *selective attraction* exercised by the visually recollected scenes touched upon by the dream-thoughts.

¹ [Footnote added 1914:] In any account of the theory of repression it would have to be laid down that a thought become repressed as a result of the combined influence upon it of *two* factors. It is pushed from the one side (by the censorship of the Cs.) and pulled from the other (by the Ucs.), in the same kind of way in which people are conveyed to the top of the Great Pyramid. [Added 1919:] Cf. my paper on repression (Freud, 1915d).

It is further to be remarked that regression plays a no less important part in the theory of the formation of neurotic symptoms than it does in that of dreams. Three kinds of regression are thus to be distinguished: (a) *topographical* regression, in the sense of the schematic picture of the Ψ -systems which we have explained above; (b) *temporal* regression, in so far as what is in question is a harking back to older psychical structures; and (c) *formal* regression, where primitive methods of expression and representation take the place of the usual ones. All these three kinds of regression are, however, one at bottom and occur together as a rule; for what is older in time is more primitive in form and in psychical topography lies nearer to the perceptual end.

Nor can we leave the subject of regression in dreams without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psycho-neuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the instinctual impulses which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood - a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's assertion that in dreams 'some primeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psycho-analysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race.

It may well be that this first portion of our psychological study of dreams will leave us with a sense of dissatisfaction. But we can console ourselves with the thought that we have been obliged to build our way out into the dark. If we are not wholly in error, other lines of approach are bound to lead us into much the same region and the time may then come when we shall find ourselves more at home in it.

(C)

WISH-FULFILMENT

The dream of the burning child at the beginning of this chapter gives us a welcome opportunity of considering the difficulties with which the theory of wish-fulfilment is faced. It will no doubt have surprised all of us to be told that dreams are nothing other than fulfilments of wishes, and not only on account of the contradiction offered by anxiety-dreams. When analysis first revealed to us that a meaning and a psychical value lay concealed behind dreams, we were no doubt quite unprepared to find that that meaning was of such a uniform character. According to Aristotle's accurate but bald definition, a dream is thinking that persists (in so far as we are asleep) in the state of sleep. Since, then, our daytime thinking produces psychical acts of such various sorts - judgements, inferences, denials, expectations, intentions, and so on - why should it be obliged during the night to restrict itself to the production of wishes alone? Are there not, on the contrary, numerous dreams which show us psychical acts of other kinds - worries, for instance - transformed into dream-shape? And was not the dream with which we began this chapter (a quite particularly transparent one) precisely a dream of this sort? When the glare of light fell on the eyes of the sleeping father, he drew the worrying conclusion that a candle had fallen over and might have set the dead body on fire. He turned this conclusion into a dream by clothing it in a sensory situation and in the present tense. What part was played in this by wish-fulfilment? Can we fail to see in it the predominating influence of a thought persisting from waking life or stimulated by a new sense-impression? All this is quite true and compels us to enter more closely into the part played by wish-fulfilment in dreams and into the importance of waking thoughts which persist into sleep.

We have already been led by wish-fulfilment itself to divide dreams into two groups. We have found some dreams which appeared openly as wish-fulfilments, and others in which the wish-fulfilment was unrecognizable and often disguised by every possible means. In the latter we have perceived the dream censorship at work. We found the undistorted wishful dreams principally in children; though *short*, frankly wishful dreams *seemed* (and I lay emphasis upon this qualification) to occur in adults as well.

We may next ask where the wishes that come true in dreams originate. What contrasting possibilities or what alternatives have we in mind in raising this question? It is the contrast, I think, between the consciously perceived life of daytime and a psychical activity which has remained unconscious and of which we can only become aware at night. I can distinguish three possible origins for such a wish. (1) It may have been aroused during the day and for external reasons may not have been satisfied; in that case an acknowledged wish which has not been dealt with is left over for the night. (2) It may have arisen during the day but been repudiated; in that case what is left over is a wish which has not been dealt with but has been suppressed. (3) It may have no connection with daytime life and be one of those wishes which only emerge from the suppressed part of the mind and become active in us at night. If we turn again to our schematic picture of the psychical apparatus, we shall localize wishes of the first kind in the system *Pcs.*; we shall suppose that wishes of the second kind have been driven out of the system *Pcs.* into the *Ucs.*, where, if at all, they continue to exist; and we shall conclude that wishful impulses of the third kind are altogether incapable of passing beyond the system *Ucs.* The question then arises whether wishes derived from these different sources are of equal importance for dreams and have equal power to instigate them.

If we cast our minds over the dreams that are at our disposal for answering this question, we shall at once be reminded that we must add a fourth source of dream-wishes, namely the current wishful impulses that arise during the night (e.g. those stimulated by thirst or sexual needs). In the next place, we shall form the opinion that the place of origin of a dream-wish probably has no influence on its capacity for instigating dreams. I may recall the little girl's dream which prolonged a trip on the lake that had been interrupted during the day and the other children's dreams which I have recorded. They were explained as being due to unfulfilled, but unsuppressed, wishes from the previous day. Instances of a wish that has been suppressed in the daytime finding its way out in a dream are exceedingly numerous. I will add a further very simple example of this class. The dreamer was a lady who was rather fond of making fun of people and one of whose friends, a woman younger than herself, had just become engaged. All day long she had been asked by her acquaintances whether she knew the young man and what she thought of him. She had replied with nothing but praises, with which she had silenced her real judgement; for she would have liked to tell the truth - that he was a '*Dutzendmensch*' [literally a 'dozen man', a very commonplace sort of person - people like him are turned out by the *dozen*]. She dreamt that night that she was asked the same question, and replied with the formula: '*In the case of repeat orders it is sufficient to quote the number.*' We have learnt, lastly, from numerous analyses that wherever a dream has undergone distortion the wish has arisen from the unconscious and was one which could not be perceived during the day. Thus it seems at a first glance as though all wishes are of equal importance and equal power in dreams.

I cannot offer any proof here that the truth is nevertheless otherwise; but I may say that I am strongly inclined to suppose that dream-wishes are more strictly determined. It is true that children's dreams prove beyond a doubt that a wish that has not been dealt with during the day can act as a dream-instigator. But it must not be forgotten that it is a *child's* wish, a wishful impulse of the strength proper to children. I think it is highly doubtful whether in the case of an adult a wish that has not been fulfilled during the day would be strong enough to produce a dream. It seems to me, on the contrary, that, with the progressive control exercised upon our instinctual life by our thought-activity, we are more and more inclined to renounce as unprofitable the formation or retention of such intense wishes as children know. It is possible that there are individual differences in this respect, and that some people retain an infantile type of mental process longer than others, just as there are similar differences in regard to the diminution of visual imagery, which is so vivid in early years. But in general, I think, a wish that has been left over unfulfilled from the previous day is insufficient to produce a dream in the case of an adult. I readily admit that a wishful impulse originating in the conscious will *contribute* to the instigation of a dream, but it will probably not do more than that. The dream would not materialize if the preconscious wish did not succeed in finding reinforcement from elsewhere.

From the unconscious, in fact. *My supposition is that a conscious wish can only become a dream-instigator if it succeeds in awakening an unconscious wish with the same tenor and in obtaining reinforcement from it.* From indications derived from the psycho-analysis of the neuroses, I consider that these unconscious wishes are always on the alert, ready at any time to find their way to expression when an opportunity arises for allying themselves with an impulse from the conscious and for transferring their own great intensity on to the latter's lesser one.¹ It will then *appear* as though the conscious wish alone had been realized in the dream; only some small peculiarity in the dream's configuration will serve as a finger-post to put us on the track of the powerful ally from the unconscious. These wishes in our unconscious, ever on the alert and, so to say, immortal, remind one of the legendary Titans, weighed down since primaeval ages by the massive bulk of the mountains which were once hurled upon them by the victorious gods and which are still shaken from time to time by the convulsion of their limbs. But these wishes, held under repression, are themselves of infantile origin, as we are taught by psychological research into the neuroses. I would propose, therefore, to set aside the assertion made just now, that the place of origin of dream-wishes is a matter of indifference and replace it by another one to the following effect: *a wish which is represented in a dream must be an infantile one.* In the case of adults it originates from the *Ucs.*, in the case of children, where there is as yet no division or censorship between the *Ucs.* and the *Pcs.*, or where that division is only gradually being set up, it is an unfulfilled, unrepressed wish from waking life. I am aware that this assertion cannot be proved to hold universally; but it can be proved to hold frequently, even in unsuspected cases, and it cannot be *contradicted* as a general proposition.

¹ They share this character of indestructibility with all other mental acts which are truly unconscious, i.e. which belong to the system *Ucs.* only. These are paths which have been laid down once and for all, which never fall into disuse and which, whenever an unconscious excitation re-cathects them, are always ready to conduct the excitatory process to discharge. If I may use a simile, they are only capable of annihilation in the same sense as the ghosts in the underworld of the *Odyssey* - ghosts which awoke to new life as soon as they tasted blood. Processes which are dependent on the preconscious system are destructible in quite another sense. The psychotherapy of the neuroses is based on this distinction.

In my view, therefore, wishful impulses left over from conscious waking life must be relegated to a secondary position in respect to the formation of dreams. I cannot allow that, as contributors to the content of dreams, they play any other part than by the material of sensations which become currently active during sleep. (See pp. 707-708.) I shall follow the same line of thought in now turning to consider those psychical instigations to dreaming, left over from waking life, which are other than wishes. When we decide to go to sleep, we may succeed in temporarily bringing to an end the cathexes of energy attaching to our waking thoughts. Anyone who can do this easily is a good sleeper; the first Napoleon seems to have been a model of this class. But we do not always succeed in doing so, nor do we always succeed completely. Unsolved problems, tormenting worries, overwhelming impressions - all these carry thought-activity over into sleep and sustain mental processes in the system that we have named the preconscious. If we wish to classify the thought-impulses which persist in sleep, we may divide them into the following groups: (1) what has not been carried to a conclusion during the day owing to some chance hindrance; (2) what has not been dealt with owing to the insufficiency of our intellectual power - what is unsolved; (3) what has been rejected and suppressed during the daytime. To these we must add (4) a powerful group consisting of what has been set in action in our *Ucs.* by the activity of the preconscious in the course of the day; and finally (5) the group of daytime impressions which are indifferent and have for that reason not been dealt with.

There is no need to underestimate the importance of the psychical intensities which are introduced into the state of sleep by these residues of daytime life, and particularly of those in the group of unsolved problems. It is certain that these excitations continue to struggle for expression during the night; and we may assume with equal certainty that the state of sleep makes it impossible for the excitatory process to be pursued in the habitual manner in the preconscious and brought to an end by becoming conscious. In so far as our thought-processes are able to become conscious in the normal way at night, we are simply not asleep. I am unable to say what modification in the system *Pcs.* is brought about by the state of sleep;¹ but there can be no doubt that the psychological characteristics of sleep are to be looked for essentially in modifications in the cathexis of this particular system - a system that is also in control of access to the power of movement, which is paralysed during sleep. On the other hand, nothing in the psychology of dreams gives me reason to suppose that sleep produces any modifications other than secondary ones in the state of things prevailing in the *Ucs.* No other course, then, lies open to excitations occurring at night in the *Pcs.* than that followed by wishful excitations arising from the *Ucs.*; the preconscious excitations must find reinforcement from the *Ucs.* and must accompany the unconscious excitations along their circuitous paths. But what is the relation of the preconscious residues of the previous day to *dreams*? There is no doubt that they find their way into dreams in great quantity, and that they make use of the content of dreams in order to penetrate into consciousness even during the night. Indeed they occasionally dominate the content of a dream and force it to carry on the activity of daytime. It is certain, too, that the day's residues may be of any other character just as easily as wishes; but it is highly instructive in this connection, and of positively decisive importance for the theory of wish-fulfilment, to observe the condition to which they must submit in order to be received into a dream.

¹ [*Footnote added 1919:*] I have tried to penetrate further into an understanding of the state of things prevailing during sleep and of the determining conditions of hallucination in a paper entitled 'A Metapsychological Supplement to the Theory of Dreams'.

Let us take one of the dreams I have already recorded - for instance, the one in which my friend Otto appeared with the signs of Graves' disease. (See p. 746 ff.) I had been worried during the previous day by Otto's looks; and, like everything else concerned with him, this worry affected me closely. And it pursued me, as I may assume, into my sleep. I was probably anxious to discover what could be wrong with him. This worry found expression during the night in the dream I have described, the content of which was in the first place nonsensical and in the second place was in no respect the fulfilment of a wish. I then began to investigate the origin of this inappropriate expression of the worry I had felt during the day, and by means of analysis I found a connection through the fact of my having identified my friend with a certain Baron L. and myself with Professor R. There was only one explanation of my having been obliged to choose this particular substitute for my daytime thought. I must have been prepared at all times in my *Ucs.* to identify myself with Professor R., since by means of that identification one of the immortal wishes of childhood - the megalomaniac wish - was fulfilled. Ugly thoughts hostile to my friend, which were certain to be repudiated during the day, had seized the opportunity of slipping through with the wish and getting themselves represented in the dream; but my daytime worry had also found some sort of expression in the content of the dream by means of a substitute. The daytime thought, which was not in itself a wish but on the contrary a worry, was obliged to find a connection in some way or other with an infantile wish which was now unconscious and suppressed, and which would enable it - suitably decocted, it is true - to 'originate' in consciousness. The more dominating was the worry, the more far-fetched a link could be established; there was no necessity for there being any connection whatever between the content of the wish and that of the worry, and in fact no such connection existed in our example.

It may perhaps be useful to continue our examination of the same question by considering how a dream behaves when the dream-thoughts present it with material which is the complete reverse of a wish-fulfilment - well-justified worries, painful reflections, distressing realizations. The many possible outcome can be classed under the two following groups. (A) The dream-work may succeed in replacing all the distressing ideas by contrary ones and in suppressing the unpleasurable affects attaching to them. The result will be a straightforward dream of satisfaction, a palpable 'wish-fulfilment', about which there seems no more to be said. (B) The distressing ideas may make their way, more or less modified but none the less quite recognizable, into the manifest content of the dream. This is the case which raises doubts as to the validity of the wish theory of dreams and needs further investigation. Dreams of this sort with a distressing content may either be experienced with indifference, or they may be accompanied by the whole of the distressing affect which their ideational content seems to justify, or they may even lead to the development of anxiety and to awakening.

Analysis is able to demonstrate that these unpleasurable dreams are wish-fulfilments no less than the rest. An unconscious and repressed wish, whose fulfilment the dreamer's ego could not fail to experience as something distressing, has seized the opportunity offered to it by the persisting cathexis of the distressing residues of the previous day; it has lent them its support and by that means rendered them capable of entering a dream. But whereas in Group A the unconscious wish coincided with the conscious one, in Group B the gulf between the unconscious and the conscious (between the repressed and the ego) is revealed and the situation in the fairy tale of the three wishes which were granted by the fairy to the husband and wife is realized. (See below, p. 1009 f. n.) The satisfaction at the fulfilment of the repressed wish may turn out to be so great that it counterbalances the distressing feelings attaching to the day's residues; in that case the feeling-tone of the dream is indifferent, in spite of its being on the one hand the fulfilment of a wish and on the other the fulfilment of a fear. Or it may happen that the sleeping ego takes a still larger share in the construction of the dream, that it reacts to the satisfying of the repressed wish with violent indignation and itself puts an end to the dream with an outburst of anxiety. Thus there is no difficulty in seeing that unpleasurable dreams and anxiety-dreams are just as much wish-fulfilments in the sense of our theory as are straightforward dreams of satisfaction.

Unpleasurable dreams may also be 'punishment-dreams'. It must be admitted that their recognition means in a certain sense a new addition to the theory of dreams. What is fulfilled in them is equally an unconscious wish, namely a wish that the dreamer may be punished for a repressed and forbidden wishful impulse. To that extent dreams of this kind fall in with the condition that has been laid down here that the motive force for constructing a dream must be provided by a wish belonging to the unconscious. A closer psychological analysis, however, shows how they differ from other wishful dreams. In the cases forming Group B the dream-constructing wish is an unconscious one and belongs to the repressed, while in punishment-dreams, though it is equally an unconscious one, it must be reckoned as belonging not to the repressed but to the 'ego.' Thus punishment-dreams indicate the possibility that the ego may have a greater share than was supposed in the construction of dreams. The mechanism of dream-formation would in general be greatly clarified if instead of the opposition between 'conscious' and 'unconscious' we were to speak of that between the 'ego' and the 'repressed.' This cannot be done, however, without taking account of the processes underlying the psychoneuroses, and for that reason it has not been carried out in the present work. I will only add that punishment-dreams are not in general subject to the condition that the day's residues shall be of a distressing kind. On the contrary, they occur most easily where the opposite is the case - where the day's residues are thoughts of a satisfying nature but the satisfaction which they express is a forbidden one. The only trace of these thoughts that appears in the manifest dream is their diametric opposite, just as in the case of dreams belonging to Group A. The essential characteristic of punishment-dreams would thus be that in their case the dream-constructing wish is not an unconscious wish derived from the repressed (from the system *Ucs.*), but a punitive one reacting against it and belonging to the ego, though at the same time an unconscious (that is to say, preconscious) one.¹

¹ [*Footnote added 1930:*] This would be the appropriate point for a reference to the 'super-ego', one of the later findings of psycho-analysis.

I will report a dream of my own in order to illustrate what I have just said, and in particular the way in which the dream-work deals with a residue of distressing anticipations from the previous day.

'Indistinct beginning. *I said to my wife that I had a piece of news for her, something quite special. She was alarmed and refused to listen. I assured her that on the contrary it was something that she would be very glad to hear, and began to tell her that our son's officer's mess had sent a sum of money (5000 Kronen?) . . . something about distinction . . . distribution. . . . Meanwhile I had gone with her into a small room, like a storeroom, to look for something. Suddenly I saw my son appear. He was not in uniform but in tight-fitting sports clothes (like a seal?), with a little cap. He climbed up on to a basket that was standing beside a cupboard, as though he wanted to put something on the cupboard. I called out to him: no reply. It seemed to me that his face or forehead was bandaged. He was adjusting something in his mouth, pushing something into it. And his hair was flecked with grey. I thought: "Could he be as exhausted as all that? And has he got false teeth?"* Before I could call out again I woke up, feeling no anxiety but with my heart beating rapidly. My bedside clock showed that it was two thirty.'

Once again it is impossible for me to present a complete analysis. I must restrict myself to bringing out a few salient points. Distressing anticipations from the previous day were what gave rise to the dream: we had once more been without news of our son at the front for over a week. It is easy to see that the content of the dream expressed a conviction that he had been wounded or killed. Energetic efforts were clearly being made at the beginning of the dream to replace the distressing thoughts by their contrary. I had some highly agreeable news to communicate - something about money being sent . . . distinction . . . distribution. (The sum of money was derived from an agreeable occurrence in my medical practice; it was an attempt at a complete diversion from the topic.) But these efforts failed. My wife suspected something dreadful and refused to listen to me. The disguises were too thin and references to what it was sought to repress pierced through them everywhere. If my son had been killed, his fellow-officers would send back his belongings and I should have to distribute what he left among his brothers and sisters and other people. A 'distinction' is often awarded to an officer who has fallen in battle. Thus the dream set about giving direct expression to what it had first sought to deny, though the inclination towards wish-fulfilment was still shown at work in the distortions. (The change of locality during the dream is no doubt to be understood as what Silberer has described as 'threshold symbolism'. We cannot tell, it is true, what it was that provided the dream with the motive force for thus giving expression to my distressing thoughts. My son did not appear as someone 'falling' but as someone 'climbing.' He had in fact been a keen mountaineer. He was not in uniform but in sports clothes; this meant that the place of the accident that I *now* feared had been taken by an *earlier*, sporting one; for he had had a fall during a skiing expedition and broken his thigh. The way in which he was dressed, on the other hand, which made him look like a seal, at once recalled someone younger - our funny little grandson; while the grey hair reminded me of the latter's father, our son-in-law, who had been hard hit by the war. What could this mean? . . . but I have said enough of it. - The locality in a store-closet and the cupboard from which he wanted to take something ('on which he wanted to put something' in the dream) - these allusions reminded me unmistakably of an accident of my own which I had brought on myself when I was between two and three years old. I had climbed up on to a stool in the store-closet to get something nice that was lying on a cupboard or table. The stool had tipped over and its corner had struck me behind my lower jaw; I might easily, I reflected, have knocked out all my teeth. The recollection was accompanied by an admonitory thought: 'that serves you right'; and this seemed as though it was a hostile impulse aimed at the gallant soldier. Deeper analysis at last enabled me to discover what the concealed impulse was which might have found satisfaction in the dreaded accident to my son: it was the envy which is felt for the young by those who have grown old, but which they believe they have completely stifled. And there can be no question that it was precisely the *strength* of the painful emotion which would have arisen if such a misfortune had really happened that caused that emotion to seek out a repressed wish-fulfilment of this kind in order to find some consolation.

I am now in a position to give a precise account of the part played in dreams by the unconscious wish. I am ready to admit that there is a whole class of dreams the *instigation* to which arises principally or even exclusively from the residues of daytime life; and I think that even my wish that I might at long last become a Professor Extraordinarius might have allowed me to sleep through the night in peace if my worry over my friend's health had not still persisted from the previous day. But the worry alone could not have made a dream. The *motive force* which the dream required had to be provided by a wish; it was the business of the worry to get hold of a wish to act as the motive force of the dream.

The position may be explained by an analogy. A daytime thought may very well play the part of *entrepreneur* for a dream; but the *entrepreneur*, who, as people say, has the idea and the initiative to carry it out, can do nothing without capital; he needs a *capitalist* who can afford the outlay, and the capitalist who provides the psychical outlay for the dream is invariably and indisputably, whatever may be the thoughts of the previous day, *a wish from the unconscious*.

Sometimes the capitalist is himself the *entrepreneur*, and indeed in the case of dreams this is the commoner event: an unconscious wish is stirred up by daytime activity and proceeds to construct a dream. So, too, the other possible variations in the economic situation that I have taken as an analogy have their parallel in dream-processes. The *entrepreneur* may himself make a small contribution to the capital; several *entrepreneurs* may apply to the same capitalist; several capitalists may combine to put up what is necessary for the *entrepreneur*. In the same way, we come across dreams that are supported by more than one dream-wish; and so too with other similar variations, which could easily be run through, but which would be of no further interest to us. We must reserve until later what remains to be said of the dream-wish.

The *tertium comparationis* in the analogy that I have just used - the quantity put at the disposal of the *entrepreneur* in an appropriate amount - is capable of being applied in still greater detail to the purpose of elucidating the structure of dreams. In most dreams it is possible to detect a central point which is marked by peculiar sensory intensity, as I have shown on p. 778. This central point is as a rule the direct representation of the wish-fulfilment, for, if we undo the displacements brought about by the dream-work, we find that the *psychical* intensity of the elements in the dream-thoughts has been replaced by the *sensory* intensity of the elements in the content of the actual dream. The elements in the *neighbourhood* of the wish-fulfilment often have nothing to do with its meaning, but turn out to be derivatives of distressing thoughts that run contrary to the wish. But owing to their being in what is often an artificially established connection with the central element, they have acquired enough intensity to become capable of being represented in the dream. Thus the wish-fulfilment's power of bringing about representation is diffused over a certain sphere surrounding it, within which all the elements - including even those possessing no means of their own - become empowered to obtain representation. In the case of dreams that are actuated by *several* wishes, it is easy to delimit the spheres of the different wish-fulfilments, and gaps in the dream may often be understood as frontier zones between those spheres.

Though the preceding considerations have reduced the importance of the part played by the day's residues in dreams, it is worth while devoting a little more attention to them. It must be that they are essential ingredients in the formation of dreams, since experience has revealed the surprising fact that in the content of every dream some link with a recent daytime impression - often of the most insignificant sort - is to be detected. We have not hitherto been able to explain the necessity for this addition to the mixture that constitutes a dream (see p. 669). And it is only possible to do so if we bear firmly in mind the part played by the unconscious wish and then seek for information from the psychology of the neuroses. We learn from the latter that an unconscious idea is as such quite incapable of entering the preconscious and that it can only exercise any effect there by establishing a connection with an idea which already belongs to the preconscious, by transferring its intensity on to it and by getting itself 'covered' by it. Here we have the fact of 'transference', which provides an explanation of so many striking phenomena in the mental life of neurotics. The preconscious idea, which thus acquires an undeserved degree of intensity may either be left unaltered by the transference, or it may have a modification forced upon it, derived from the content of the idea which effects the transference. I hope I may be forgiven for drawing analogies from everyday life, but I am tempted to say that the position of a repressed idea resembles that of an American dentist in this country: he is not allowed to set up in practice unless he can make use of a legally qualified medical practitioner to serve as a stalking-horse and to act as a 'cover' in the eyes of the law. And just as it is not exactly the physicians with the largest practices who form alliances of this kind with dentists, so in the same way preconscious or conscious ideas which have already attracted a sufficient amount of the attention that is operating in the preconscious will not be the ones to be chosen to act as covers for a repressed idea. The unconscious prefers to weave its connections round preconscious impressions and ideas which are either indifferent and have thus had no attention paid to them, or have been rejected and have thus had attention promptly withdrawn from them. It is a familiar article in the doctrine of association, and one that is entirely confirmed by experience, that an idea which is bound by a very intimate tie in one direction, tends, as it were, to repel whole groups of new ties. I once attempted to base a theory of hysterical paralyses on this proposition.

If we assume that the same need for transference on the part of repressed ideas which we have discovered in analysing the neuroses is also at work in dreams, two of the riddles of the dream are solved at a blow: the fact, namely, that every analysis of a dream shows some recent impression woven into its texture and that this recent element is often of the most trivial kind. I may add that (as we have already found elsewhere) the reason why these recent and indifferent elements so frequently find their way into dreams as substitutes for the most ancient of all the dream-thoughts is that they have least to fear from the censorship imposed by resistance. But while the fact that *trivial* elements are preferred is explained by their freedom from censorship, the fact that *recent* elements occur with such regularity points to the existence of a need for transference. Both groups of impressions satisfy the demand of the repressed for material that is still clear of associations - the indifferent ones because they have given no occasion for the formation of many ties, and the recent ones because they have not yet had time to form them.

It will be seen, then, that the day's residues, among which we may now class the indifferent impressions, not only *borrow* something from the *Ucs.* when they succeed in taking a share in the formation of a dream - namely the instinctual force which is at the disposal of the repressed wish - but that they also *offer* the unconscious something indispensable - namely the necessary point of attachment for a transference. If we wished to penetrate more deeply at this point into the processes of the mind, we should have to throw more light upon the interplay of excitations between the preconscious and the unconscious a subject towards which the study of the psychoneuroses draws us, but upon which, as it happens, dreams have no help to offer.

I have only one thing more to add about the day's residues. There can be no doubt that it is they that are the true disturbers of sleep and not dreams, which, on the contrary are concerned to guard it. I shall return to this point later.

We have so far been studying dream-wishes: we have traced them from their origin in the region of the *Ucs.* and have analysed their relations to the day's residues, which in their turn may either be wishes or psychical impulses of some other kind or simply recent impressions. In this way we have allowed room for every claim that may be raised by any of the multifarious waking thought-activities on behalf of the importance of the part played by them in the process of constructing dreams. It is not impossible, even, that our account may have provided an explanation of the extreme cases in which a dream, pursuing the activities of daytime, arrives at a happy solution of some unsolved problem of waking life. All we need is an example of this kind, so that we might analyse it and trace the source of the infantile or repressed wishes whose help has been enlisted and has reinforced the efforts of preconscious activity with such success. But all this has not brought us a step nearer to solving the riddle of why it is that the unconscious has nothing else to offer during sleep but the motive force for the fulfilment of a *wish*. The answer to this question must throw light upon the psychical nature of wishes, and I propose to give the answer by reference to our schematic picture of the psychical apparatus.

There can be no doubt that that apparatus has only reached its present perfection after a long period of development. Let us attempt to carry it back to an earlier stage of its functioning capacity. Hypotheses, whose justification must be looked for in other directions, tell us that at first the apparatus's efforts were directed towards keeping itself so far as possible free from stimuli; consequently its first structure followed the plan of a reflex apparatus, so that any sensory excitation impinging on it could be promptly discharged along a motor path. But the exigencies of life interfere with this simple function, and it is to them, too, that the apparatus owes the impetus to further development. The exigencies of life confront it first in the form of the major somatic needs. The excitations produced by internal needs seek discharge in movement, which may be described as an 'internal change' or an 'expression of emotion.' A hungry baby screams or kicks helplessly. But the situation remains unaltered, for the excitation arising from an internal need is not due to a force producing a *momentary* impact but to one which is in continuous operation. A change can only come about if in some way or other (in the case of the baby, through outside help) an 'experience of satisfaction' can be achieved which puts an end to the internal stimulus. An essential component of this experience of satisfaction is a particular perception (that of nourishment, in our example) the mnemonic image of which remains associated thenceforward with the memory trace of the excitation produced by the need. As a result of the link that has thus been established, next time this need arises a psychical impulse will at once emerge which will seek to re-cathect the mnemonic image of the perception and to re-evoke the perception itself, that is to say, to re-establish the situation of the original satisfaction. An impulse of this kind is what we call a wish; the reappearance of the perception is the fulfilment of the wish; and the shortest path to the fulfilment of the wish is a path leading direct from the excitation produced by the need to a complete cathexis of the perception. Nothing prevents us from assuming that there was a primitive state of the psychical apparatus in which this path was actually traversed, that is, in which wishing ended in hallucinating. Thus the aim of this first psychical activity was to produce a 'perceptual identity' - a repetition of the perception which was linked with the satisfaction of the need.

The bitter experience of life must have changed this primitive thought-activity into a more expedient secondary one. The establishment of a perceptual identity along the short path of regression within the apparatus does not have the same result elsewhere in the mind as does the cathexis of the same perception from without. Satisfaction does not follow; the need persists. An internal cathexis could only have the same value as an external one if it were maintained unceasingly, as in fact occurs in hallucinatory psychoses and hunger phantasies, which exhaust their whole psychical activity in clinging to the object of their wish. In order to arrive at a more efficient expenditure of psychical force, it is necessary to bring the regression to a halt before it becomes complete, so that it does not proceed beyond the mnemic image, and is able to seek out other paths which lead eventually to the desired perceptual identity being established from the direction of the external world.¹ This inhibition of the regression and the subsequent diversion of the excitation become the business of a second system, which is in control of voluntary movement - which for the first time, that is, makes use of movement for purposes remembered in advance. But all the complicated thought-activity which is spun out from the mnemic image to the moment at which the perceptual identity is established by the external world - all this activity of thought merely constitutes a roundabout path to wish-fulfilment which has been made necessary by experience.² Thought is after all nothing but a substitute for a hallucinatory wish; and it is self-evident that dreams must be wish-fulfilments, since nothing but a wish can set our mental apparatus at work. Dreams, which fulfil their wishes along the short path of regression, have merely preserved for us in that respect a sample of the psychical apparatus's primary method of working, a method which was abandoned as being inefficient. What once dominated waking life, while the mind was still young and incompetent, seems now to have been banished into the night - just as the primitive weapons, the bows and arrows, that have been abandoned by adult men, turn up once more in the nursery. *Dreaming is a piece of infantile mental life that has been superseded.* These methods of working on the part of the psychical apparatus, which are normally suppressed in waking hours, become current once more in psychosis and then reveal their incapacity for satisfying our needs in relation to the external world.³

¹ [Footnote added 1919:] In other words, it becomes evident that there must be a means of 'reality-testing'.

² The wish-fulfilling activity of dreams is justly extolled by Le Lorrain, who speaks of it as 'sans fatigue sérieuse, sans être obligé de recourir à cette lutte opiniâtre et longue qui use et corrode les jouissances poursuivies [incurring no serious fatigue and not being obliged to embark upon the long and obstinate struggle that wears away and spoils enjoyments that have to be pursued].'

³ [Footnote added 1914:] I have elsewhere carried this train of thought further in a paper on the two principles of mental functioning (Freud 1911*b*) - the pleasure principle and the reality principle, as I have proposed calling them.

The unconscious wishful impulses clearly try to make themselves effective in daytime as well, and the fact of transference, as well as the psychoses, show us that they endeavour to force their way by way of the preconscious system into consciousness and to obtain control of the power of movement. Thus the censorship between the *Ucs.* and the *Pcs.*, the assumption of whose existence is positively forced upon us by dreams, deserves to be recognized and respected as the watchman of our mental health. Must we not regard it, however, as an act of carelessness on the part of that watchman that it relaxes its activities during the night, allows the suppressed impulses in the *Ucs.* to find expression, and makes it possible for hallucinatory regression to occur once more? I think not. For even though this critical watchman goes to rest - and we have proof that its slumbers are not deep - it also shuts the door upon the power of movement. No matter what impulses from the normally inhibited *Ucs.* may prance upon the stage, we need feel no concern; they remain harmless, since they are unable to set in motion the motor apparatus by which alone they might modify the external world. The state of sleep guarantees the security of the citadel that must be guarded. The position is less harmless when what brings about the displacement of forces is not the nightly relaxation in the critical censorship's output of force, but a pathological reduction in that force or a pathological intensification of the unconscious excitations while the preconscious is still cathected and the gateway to the power of movement stands open. When this is so, the watchman is overpowered, the unconscious excitations overwhelm the *Pcs.*, and thence obtain control over our speech and actions; or they forcibly bring about hallucinatory regression and direct the course of the apparatus (which was not designed for their use) by virtue of the attraction exercised by perceptions on the distribution of our psychical energy. To this state of things we give the name of psychosis.

We are now well on the way to proceeding further with the erection of the psychological scaffolding, which we stopped at the point at which we introduced the two systems *Ucs.* and *Pcs.* But there are reasons for continuing a little with our consideration of wishes as the sole psychical motive force for the construction of dreams. We have accepted the idea that the reason why dreams are invariably wish-fulfilments is that they are products of the system *Ucs.*, whose activity knows no other aim than the fulfilment of wishes and which has at its command no other forces than wishful impulses. If we insist, for even a moment longer, upon our right to base such far-reaching psychological speculations upon the interpretation of dreams, we are in duty bound to prove that those speculations have enabled us to insert dreams into a nexus which can include other psychical structures as well. If such a thing as a system *Ucs.* exists (or something analogous to it for the purposes of our discussion), dreams cannot be its only manifestation; every dream may be a wish-fulfilment, but apart from dreams there must be other forms of abnormal wish-fulfilments. And it is a fact that the theory governing all psychoneurotic symptoms culminates in a single proposition, which asserts that *they too are to be regarded as fulfilments of unconscious wishes.*¹ Our explanation makes the dream only the first member of a class which is of the greatest significance to psychiatrists and an understanding of which implies the solution of the purely psychological side of the problem of psychiatry.²

¹ [Footnote added 1914:] Or more correctly, one portion of the symptom corresponds to the unconscious wish-fulfilment and another portion to the mental structure reacting against the wish.

² [Footnote added 1914:] As Hughlings Jackson said: 'Find out all about dreams and you will have found out all about insanity.'

The other members of this class of wish-fulfilments - hysterical symptoms, for instance - possess one essential characteristic, however, which I cannot discover in dreams. I have learnt from the researches which I have mentioned so often in the course of this work that in order to bring about the formation of a hysterical symptom *both* currents of our mind must converge. A symptom is not merely the expression of a realized unconscious wish; a wish from the preconscious which is fulfilled by the same symptom must also be present. So that the symptom will have of *at least* two determinants, one arising from each of the systems involved in the conflict. As in the case of dreams, there are no limits to the further determinants that may be present - to the 'overdetermination' of the symptoms. The determinant which does not arise from the *Ucs.* is invariably, so far as I know, a train of thought reacting against the unconscious wish - a self-punishment, for instance. I can therefore make the quite general assertion that *a hysterical symptom develops only where the fulfilments of two opposing wishes, arising each from a different psychical system, are able to converge in a single expression.* (Compare in this connection my most recent formulations on the origin of hysterical symptoms in my paper on hysterical phantasies and their relation to bisexuality.) Examples would serve very little purpose here, since nothing but an exhaustive elucidation of the complications involved could carry conviction. I will therefore leave my assertion to stand for itself and only quote an example in order to make the point clear, and not to carry conviction. In one of my women patients, then, hysterical vomiting turned out to be on the one hand the fulfilment of an unconscious phantasy dating from her puberty - of a wish, that is, that she might be continuously pregnant and have innumerable children, with a further wish, added later, that she might have them by as many men as possible. A powerful defensive impulse had sprung up against this unbridled wish. And, since the patient might lose her figure and her good looks as a result of her vomiting, and so might cease to be attractive to anyone, the symptom was acceptable to the punitive train of thought as well; and since it was permitted by both sides it could become a reality. This was the same method of treating a wish-fulfilment as was adopted by the Parthian queen towards the Roman triumvir Crassus. Believing that he had embarked on his expedition out of love of gold, she ordered molten gold to be poured down his throat when he was dead: 'Now', she said, 'you have what you wanted.' But all that we so far know about dreams is that they express the fulfilment of a wish from the unconscious; it seems as though the dominant, preconscious system acquiesces in this after insisting upon a certain number of distortions. Nor is it possible as a general rule to find a train of thought opposed to the dream-wish and, like its counterpart, realized in the dream. Only here and there in dream-analyses do we come upon signs of reactive creations, like, for instance, my affectionate feelings for my friend R. in the dream of my uncle (cf. p. 637 ff.). But we can find the missing ingredient from the preconscious elsewhere. Whereas the wish from the *Ucs.* is able to find expression in the dream after undergoing distortions of every kind, the dominant system withdraws into a *wish to sleep*, realizes that wish by bringing about the modifications which it is able to produce in the cathexes within the psychical apparatus, and persists in that wish throughout the whole duration of sleep.¹

¹ I have borrowed this idea from the theory of sleep put forward by Liébeault (1889), to whom is due the revival in modern times of research into hypnotism.

This determined wish on the part of the preconscious to sleep exercises a generally facilitating effect on the formation of dreams. Let me recall the dream dreamt by the man who was led to infer from the glare of light coming out of the next room that his child's body might be on fire. The father drew this inference in a dream instead of allowing himself to be woken up by the glare; and we have suggested that one of the psychical forces responsible for this result was a wish which prolonged by that one moment the life of the child whom he pictured in the dream. Other wishes, originating from the repressed, probably escape us, since we are unable to analyse the dream. But we may assume that a further motive force in the production of the dream was the father's need to sleep; his sleep, like the child's life, was prolonged by one moment by the dream. 'Let the dream go on' - such was his motive - 'or I shall have to wake up.' In every other dream, just as in this one, the wish to sleep lends its support to the unconscious wish. On p. 624 f. I described some dreams which appeared openly as dreams of convenience. But in fact all dreams can claim a right to the same description. The operation of the wish to continue sleeping is most easily to be seen in arousal dreams, which modify external sensory stimuli in such a way as to make them compatible with a continuance of sleep; they weave them into a dream in order to deprive them of any possibility of acting as reminders of the external world. That same wish must, however, play an equal part in allowing the occurrence of all other dreams, though it may only be from *within* that they threaten to shake the subject out of his sleep. In some cases, when a dream carries things too far, the *Ucs.* says to consciousness: 'Never mind! go on sleeping! after all it's only a dream!' But this describes in general the attitude of our dominant mental activity towards dreams, though it may not be openly expressed. I am driven to conclude that *throughout our whole sleeping state we know just as certainly that we are dreaming as we know that we are sleeping.* We must not pay too much attention to the counter-argument that our consciousness is never brought to bear on the latter piece of knowledge and that it is only brought to bear on the former on particular occasions when the censorship feels that it has, as it were, been taken off its guard.

On the other hand, there are some people who are quite clearly aware during the night that they are asleep and dreaming and who thus seem to possess the faculty of consciously directing their dreams. If, for instance, a dreamer of this kind is dissatisfied with the turn taken by a dream, he can break it off without waking up and start it again in another direction - just as a popular dramatist may under pressure give his play a happier ending. Or another time, if his dream has led him into a sexually exciting situation, he can think to himself: 'I won't go on with this dream any further and exhaust myself with an emission; I'll hold it back for a real situation instead.'

The Marquis d'Hervey de Saint-Denys, quoted by Vaschide (1911, 139), claimed to have acquired the power of accelerating the course of his dreams just as he pleased, and of giving them any direction he chose. It seems as though in his case the wish to sleep had given place to another preconscious wish, namely to observe his dreams and enjoy them. Sleep is just as compatible with a wish of this sort as it is with a mental reservation to wake up if some particular condition is fulfilled (e.g. in the case of a nursing mother or wet-nurse). Moreover, it is a familiar fact that anyone who takes an interest in dreams remembers a considerably greater number of them after waking.

Ferenczi (1911), in the course of a discussion of some other observations upon the directing of dreams, remarks: 'Dreams work over the thoughts which are occupying the mind at the moment from every angle; they will drop a dream-image if it threatens the success of a wish-fulfilment and will experiment with a fresh solution, till at last they succeed in constructing a wish-fulfilment which satisfies both agencies of the mind as a compromise.'

(B)

AROUSAL BY DREAMS - THE FUNCTION OF DREAMS - ANXIETY-DREAMS

Now that we know that all through the night the preconscious is concentrated upon the wish to sleep, we are in a position to carry our understanding of the process of dreaming a stage further. But first let us summarize what we have learnt so far.

The situation is this. Either residues of the previous day have been left over from the activity of waking life and it has not been possible to withdraw the whole cathexis of energy from them; or the activity of waking life during the course of the day has led to the stirring up of an unconscious wish; or these two events have happened to coincide. (We have already discussed the various possibilities in this connection.) The unconscious wish links itself up with the day's residues and effects a transference on to them; this may happen either in the course of the day or not until a state of sleep has been established. A wish now arises which has been transferred on to the recent material; or a recent wish, having been suppressed, gains fresh life by being reinforced from the unconscious. This wish seeks to force its way along the normal path taken by thought processes, though the *Pcs.* (to which, indeed, it in part belongs) to consciousness. But it comes up against the censorship, which is still functioning and to the influence of which it now submits. At this point it takes on the distortion for which the way has already been paved by the transference of the wish on to recent material. So far it is on the way to becoming an obsessive idea or a delusion or something of the kind - that is, a *thought* which has been intensified by transference and distorted in its expression by censorship. Its further advance is halted, however, by the sleeping state of the preconscious. (The probability is that that system has protected itself against the invasion by diminishing its own excitations.) The dream-process consequently enters on a regressive path, which lies open to it precisely owing to the peculiar nature of the state of sleep, and it is led along that path by the attraction exercised on it by groups of memories; some of these memories themselves exist only in the form of visual cathexes and not as translations into the terminology of the later systems. In the course of its regressive path the dream-process acquires the attribute of representability. (I shall deal later with the question of compression.) It has now completed the second portion of its zigzag journey. The first portion was a progressive one, leading from the unconscious scenes or phantasies to the preconscious; the second portion led from the frontier of the censorship back again to perceptions. But when the content of the dream process has become perceptual, by that fact it has, as it were, found a way of evading the obstacle put in its way by the censorship and the state of sleep in the *Pcs.* It succeeds in drawing attention to itself and in being noticed by consciousness.

For consciousness, which we look upon in the light of a sense organ for the apprehension of psychical qualities, is capable in waking life of receiving excitations from two directions. In the first place, it can receive excitations from the periphery of the whole apparatus, the perceptual system; and in addition to this, it can receive excitations of pleasure and unpleasure, which prove to be almost the only psychical quality attaching to transpositions of energy in the inside of the apparatus. All other processes in the Ψ -systems, including the *Pcs.*, are lacking in any psychical quality and so cannot be objects of consciousness, except in so far as they bring pleasure or unpleasure to perception. We are thus driven to conclude that *these releases of pleasure and unpleasure automatically regulate the course of cathectic processes*. But, in order to make more delicately adjusted performances possible, it later became necessary to make the course of ideas less dependent upon the presence or absence of unpleasure. For this purpose the *Pcs.* system needed to have qualities of its own which could attract consciousness; and it seems highly probable that it obtained them by linking the preconscious processes with the mnemonic system of indications of speech, a system which was not without quality. By means of the qualities of that system, consciousness, which had hitherto been a sense organ for perceptions alone. Now, therefore, there are, as it were, *two* sensory surfaces, one directed towards perception and the other towards the preconscious thought-processes.

I must assume that the state of sleep makes the sensory surface of consciousness which is directed towards the *Pcs.* far more insusceptible to excitation than the surface directed towards the *Pcpt.* systems. Moreover, this abandonment of interest in thought-processes during the night has a purpose: thinking is to come to a standstill, for the *Pcs.* requires sleep. Once, however, a dream has become a *perception*, it is in a position to excite consciousness, by means of the qualities it has now acquired. This sensory excitation proceeds to perform what is its essential function: it directs a part of the available cathectic energy in the *Pcs.* into attention to what is causing the excitation. It must therefore be admitted that every dream has an *arousing* effect, that it sets a part of the quiescent force of the *Pcs.* in action. The dream is then submitted by this force to the influence which we have described as secondary revision with an eye to consecutiveness and intelligibility. That is to say, the dream is treated by it just like any other perceptual content; it is met by the same anticipatory ideas, in so far as its subject-matter allows. So far as this third portion of the dream-process has any direction it is once again a progressive one.

To avoid misunderstandings, a word about the chronological relations of these dream-processes will not be out of place. A very attractive conjecture has been put forward by Goblots, suggested, no doubt, by the riddle of Maury's guillotine dream. He seeks to show that a dream occupies no more than the transition period between sleeping and waking. The process of awakening takes a certain amount of time, and during that time the dream occurs. We imagine that the final dream-image was so powerful that it compelled us to wake; whereas in fact it was only so powerful because at that moment we were already on the point of waking. 'Un rêve c'est un réveil qui commence.'¹

It has already been pointed out by Dugas that Goblots would have to disregard many facts before he could assert his thesis generally. Dreams occur from which we do not awaken for instance, some in which we dream that we are dreaming. With our knowledge of the dream-work, we could not possibly agree that it only covers the period of awakening. It seems probable, on the contrary, that the first portion of the dream-work has already begun during the day, under the control of the preconscious. Its second portion - the modification imposed by the censorship, the attraction exercised by unconscious scenes, and the forcing of its way to perception - no doubt proceeds all through the night; and in this respect we may perhaps always be right when we express a feeling of having been dreaming all night long, though we cannot say what.

¹ ['A dream is an awakening that is beginning.']

But it seems to me unnecessary to suppose that dream-processes really maintain, up to the moment of becoming conscious, the chronological order in which I have described them: that the first thing to appear is the transferred dream-wish, that distortion by the censorship follows, then the regressive change in direction, and so on. I have been obliged to adopt this order in my description; but what happens in reality is no doubt a simultaneous exploring of one path and another, a swinging of the excitation now this way and now that, until at last it accumulates in the direction that is most opportune and one particular grouping becomes the permanent one. Certain personal experiences of my own lead me to suspect that the dream-work often requires more than a day and a night in order to achieve its result; and if this is so, we need no longer feel any amazement at the extraordinary ingenuity shown in the construction of the dream. In my opinion even the demand for the dream to be made intelligible as a perceptual event may be put into effect before the dream attracts consciousness to itself. From then onwards, however, the pace is accelerated, for at that point a dream is treated in the same fashion as anything else that is perceived. It is like a firework, which takes hours to prepare but goes off in a moment.

The dream-process has by now either acquired sufficient intensity though the dream-work to attract consciousness to itself and arouse the preconscious, irrespectively of the time and depth of sleep; or its intensity is insufficient to achieve this and it must remain in a state of readiness until, just before waking, attention becomes more mobile and comes to meet it. The majority of dreams appear to operate with comparatively low psychical intensities, for they mostly wait until the moment of waking. But this also explains the fact that, if we are suddenly woken from deep sleep, we usually perceive something that we have dreamt. In such cases, just as when we wake of our own accord, the first thing we see is the perceptual content that has been constructed by the dream-work and immediately afterwards we see the perceptual content that is offered to us from outside ourselves.

Greater theoretical interest, however, attaches to the dreams which have the power to rouse us in the middle of our sleep. Bearing in mind the expediency which is everywhere else the rule, we may ask why a dream, that is, an unconscious wish, is given the power to interfere with sleep, that is, with the fulfilment of the preconscious wish. The explanation no doubt lies in relations of energy of which we have no knowledge. If we possessed such knowledge, we should probably find that allowing the dream to take its course and expending a certain amount of more or less detached attention on it is an economy of energy compared with holding the unconscious as tightly under control at night as in the daytime. Experience shows that dreaming is compatible with sleeping, even if it interrupts sleep several times during the night. One wakes up for an instant and then falls asleep again at once. It is like brushing away a fly in one's sleep: a case of *ad hoc* awakening. If one falls asleep again, the interruption has been disposed of. As is shown by such familiar examples as the sleep of a nursing mother or wet nurse, the fulfilment of the wish to sleep is quite compatible with maintaining a certain expenditure of attention in some particular direction.

At this point an objection arises, which is based on a better knowledge of unconscious processes. I myself have asserted that unconscious wishes are always active. But in spite of this they seem not to be strong enough to make themselves perceptible during the day. If, however, while a state of sleep prevails, an unconscious wish has shown itself strong enough to construct a dream and arouse the preconscious with it, why should this strength fail after the dream has been brought to knowledge? Should not the dream continue to recur perpetually, precisely as the vexatious fly keeps on coming back after it has been driven away? What right have we to assert that dreams get rid of the disturbance of sleep?

It is perfectly true that unconscious wishes always remain active. They represent paths which can always be traversed, whenever a quantity of excitation makes use of them. Indeed it is a prominent feature of unconscious processes that they are indestructible. In the unconscious nothing can be brought to an end, nothing is past or forgotten. This is brought most vividly home to one in studying the neuroses, and especially hysteria. The unconscious path of thoughts, which leads to discharge in a hysterical attack, immediately becomes traversable once more, when sufficient excitation has accumulated. A humiliation that was experienced thirty years ago acts exactly like a fresh one throughout the thirty years, as soon as it has obtained access to the unconscious sources of emotion. As soon as the memory of it is touched, it springs into life again and shows itself cathected with excitation which finds a motor discharge in an attack. This is precisely the point at which psychotherapy has to intervene. Its task is to make it possible for the unconscious processes to be dealt with finally and be forgotten. For the fading of memories and the emotional weakness of impressions which are no longer recent, which we are inclined to regard as self-evident and to explain as a primary effect of time upon mental memory-traces, are in reality secondary modifications which are only brought about by laborious work. What performs this work is the preconscious, and *psychotherapy can pursue no other course than to bring the Ucs. under the domination of the Pcs.*

Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being *discharged*, may be *bound* by the preconscious. *This second alternative is the one which occurs in the process of dreaming.* The cathexis from the Pcs. which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really *has* brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually *is* more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious work - rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the Ucs. which has been left free; in so doing, it discharges the Ucs. excitation, serves it as a safety valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise; it is in the service of both of the two systems since it fulfils the two wishes in so far as they are compatible with each other. If we turn back to the 'excretion theory' of dreams put forward by Robert, which I explained on p. 586 ff., we shall see at a glance that in its essence we must accept his account of the *function* of dreams, though differing from him in his premises and in his view of the dream-process itself.¹

¹ [Footnote added 1914:] Is this the only function that can be assigned to dreams? I know of no other. It is true that Maeder has attempted to show that dreams have other, 'secondary', functions. He started out from the correct observation that some dreams contain attempts at solving conflicts, attempts which are later carried out in reality and which thus behave as though they were trial practices for waking actions. He therefore drew a parallel between dreams and the play of animals and children, which may be regarded as practice in the operation of innate instincts and as preparation for serious activity later on, and put forward the hypothesis that dreams have a '*fonction ludique*' ['play function']. Shortly before Maeder, Alfred Adler, too, had insisted that dreams possessed a function of 'thinking ahead.' (In an analysis which I published in 1905, a dream, which could only be regarded as expressing an intention, was repeated every night until it was carried out.)

A little reflection will convince us, however, that this 'secondary' function of dreams has no claim to be considered as a part of the subject of dream-interpretation. Thinking ahead, forming intentions, framing attempted solutions which may perhaps be realized later in waking life, all these, and many other similar things, are products of the unconscious and preconscious activity of the mind; they may persist in the state of sleep as 'the day's residues' and combine with an unconscious wish (cf. p. 982 ff.) in forming a dream. Thus the dream's function of 'thinking ahead' is rather a function of preconscious waking thought, the products of which may be revealed to us by the analysis of dreams or of other phenomena. It has long been the habit to regard dreams as identical with their manifest content; but we must now beware equally of the mistake of confusing dreams with latent dream-thoughts.

The qualification 'in so far as the two wishes are compatible with each other' implies a hint at the possible case in which the function of dreaming may come to grief. The dream-process is allowed to begin as a fulfilment of an unconscious wish; but if this attempted wish-fulfilment jars upon the preconscious so violently that it is unable to continue sleeping, then the dream has made a breach in the compromise and has failed to carry out the second half of its task. In that case the dream is immediately broken off and replaced by a state of complete waking. Here again it is not really the fault of the dream if it has now to appear in the role of a *disturber* of sleep instead of in its normal one of a *guardian* of sleep; and this fact need not prejudice us against its having a useful purpose. This is not the only instance in the organism of a contrivance which is normally useful becoming useless and disturbing as soon as the conditions that give rise to it are somewhat modified; and the disturbance at least serves the new purpose of drawing attention to the modification and of setting the organism's regulative machinery in motion against it. What I have in mind is of course the case of anxiety-dreams, and in order that I may not be thought to be evading this evidence against the theory of wish-fulfilment whenever I come across it, I will at all events give some hints of their explanation.

There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the *Ucs.*, while it has been repudiated and suppressed by the other system, the *Pcs.*¹ Even where psychical health is perfect, the subjugation of the *Ucs.* by the *Pcs.* is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the *Ucs.* an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand they make it possible for the *Pcs.* to control the *Ucs.* to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

¹ [Footnote added 1919:] 'A second factor, which is much more important and far-reaching, but which is equally overlooked by laymen is the following. No doubt a wish-fulfilment must bring pleasure; but the question then arises "To whom?" To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them - he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream-wishes can only be compared to an amalgamation of two separate people who are linked by some important common element. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish-fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish-fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one - man and wife - the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.' (*Introductory Lectures on Psycho-Analysis*, Lecture XIV.)

Our discussion cannot be carried any further without examining the part played by the affects in these processes; but we can only do so imperfectly in the present connection. Let us assume, then, that the suppression of the *Ucs.* is necessary above all because, if the course of ideas in the *Ucs.* were left to itself, it would generate an affect which was originally of a pleasurable nature, but became unpleasurable after the process of 'repression' occurred. The purpose, and the result too, of suppression is to prevent this release of unpleasure. The suppression extends over the ideational content of the *Ucs.*, since the release of unpleasure might start from that content. This presupposes a quite specific assumption as to the nature of the generation of affect. It is viewed as a motor or secretory function, the key to whose innervation lies in the ideas in the *Ucs.* Owing to the domination established by the *Pcs.* these ideas are, as it were, throttled, and inhibited from sending out impulses which would generate affect. If, therefore, the cathexis from the *Pcs.* ceases, the danger is that the unconscious excitations may release affect of a kind which (as a result of the repression which has already occurred) can only be experienced as unpleasure, as anxiety.

This danger materializes if the dream-process is allowed to take its course. The conditions which determine its realization are that repressions must have occurred and that the suppressed wishful impulses shall be able to grow sufficiently strong. These determinants are thus quite outside the psychological framework of dream-formation. If it were not for the fact that our topic is connected with the subject of the generation of anxiety by the single factor of the liberation of the *Ucs.* during sleep, I should be able to omit any discussion of anxiety-dreams and avoid the necessity for entering in these pages into all the obscurities surrounding them.

The theory of anxiety-dreams, as I have already repeatedly declared, forms part of the psychology of the neuroses. We have nothing more to do with it when once we have indicated its point of contact with the topic of the dream-process. There is only one thing more that I can do. Since I have asserted that neurotic anxiety arises from sexual sources, I can submit some anxiety-dreams to analysis in order to show the sexual material present in their dream-thoughts.

I have good reasons for leaving on one side in the present discussion the copious examples afforded by my neurotic patients, and for preferring to quote some anxiety-dreams dreamt by young people.

It is dozens of years since I myself had a true anxiety-dream, but I remember one from my seventh or eighth year, which I submitted to interpretation some thirty years later. It was a very vivid one, and in it I saw *my beloved mother, with a peculiarly peaceful, sleeping expression on her features, being carried into the room by two (or three) people with bird's beaks and laid upon the bed*. I awoke in tears and screaming, and interrupted my parents' sleep. The strangely draped and unnaturally tall figures with birds' beaks were derived from the illustrations to Philippon's Bible. I fancy they must have been gods with falcons' heads from an ancient Egyptian funerary relief. Besides this, the analysis brought to mind an ill-mannered boy, a son of a *concierge*, who used to play with us on the grass in front of the house when we were children, and who I am inclined to think was called Philipp. It seems to me that it was from this boy that I first heard the vulgar term for sexual intercourse, instead of which educated people always use a Latin word, 'to copulate', and which was clearly enough indicated by the choice of the falcons' heads. I must have guessed the sexual significance of the word from the face of my young instructor, who was well acquainted with the facts of life. The expression on my mother's features in the dream was copied from the view I had had of any grandfather a few days before his death as he lay snoring in a coma. The interpretation carried out in the dream by the 'secondary revision' must therefore have been that my mother was dying; the funerary relief fitted in with this. I awoke in anxiety, which did not cease till I had woken my parents up. I remember that I suddenly grew calm when I saw my mother's face, as though I had needed to be reassured that she was not dead. But this 'secondary' interpretation of the dream had already been made under the influence of the anxiety which had developed. I was not anxious because I had dreamt that my mother was dying; but I interpreted the dream in that sense in my preconscious revision of it because I was already under the influence of the anxiety. The anxiety can be traced back, when repression is taken into account, to an obscure and evidently sexual craving that had found appropriate expression in the visual content of the dream.

A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that *a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot*. This is a good example of a very common sort of anxiety-dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often noticed blood in his mother's bed.

It is, I may say, a matter of daily experience that sexual intercourse between adults strikes any children who may observe it as something uncanny and that it arouses anxiety in them. I have explained this anxiety by arguing that what we are dealing with is a sexual excitation with which their understanding is unable to cope and which they also, no doubt, repudiate because their parents are involved in it, and which is therefore transformed into anxiety. At a still earlier period of life sexual excitations directed towards a parent of the opposite sex have not yet met with repression and, as we have seen, are freely expressed. (See p. 735 ff.)

I should have no hesitation in giving the same explanation of the attacks of night terrors accompanied by hallucinations (*pavor nocturnus*) which are so frequent in children. In this case too it can only be a question of sexual impulses which have not been understood and which have been repudiated. Investigation would probably show a periodicity in the occurrence of the attacks, since an increase in sexual libido can be brought about not only by accidental exciting impressions but also by successive waves of spontaneous developmental processes.

I lack a sufficiency of material based upon observation to enable me to confirm this explanation.¹

Paediatricians, on the other hand, seem to lack the only line of approach which can make this whole class of phenomena intelligible, whether from the somatic or from the psychical aspect. I cannot resist quoting an amusing instance of the way in which the blinkers of medical mythology can cause an observer to miss an understanding of such cases by a narrow margin. My instance is taken from a thesis on *pavor nocturnus* by Debacker (1881, 66):

A thirteen-year-old boy in delicate health began to be apprehensive and dreamy. His sleep became disturbed and was interrupted almost once a week by severe attacks of anxiety accompanied by hallucinations. He always retained a very clear recollection of these dreams. He said that the Devil had shouted at him: 'Now we've got you, now we've got you!' There was then a smell of pitch and brimstone and his skin was burnt by flames. He woke up from the dream in terror, and at first could not cry out. When he had found his voice he was clearly heard to say: 'No, no, not me; I've not done anything!' or 'Please not! I won't do it again!' or sometimes: 'Albert never did that!' Later, he refused to undress 'because the flames only caught him when he was undressed.' While he was still having these devil-dreams, which were a threat to his health, he was sent into the country. There he recovered in the course of eighteen months, and once, when he was fifteen, he confessed: 'Je n'osais pas l'avouer, mais j'éprouvais continuellement des picotements et des surexcitations aux parties; à la fin, cela m'énervait tant que plusieurs fois j'ai pensé me jeter par la fenêtre du dortoir.'³

¹ [Footnote added 1919:] Since I wrote this a great quantity of such material has been brought forward in psycho-analytic literature.

² I have italicized this word, but it is impossible to misunderstand it.

³ ['I didn't dare admit it; but I was continually having prickly feelings and overexcitement in my parts; in the end it got on my nerves so much that I often thought of jumping out of the dormitory window.']

There is really very little difficulty in inferring: (1) that the boy had masturbated when he was younger, that he had probably denied it, and that he had been threatened with severe punishment for his bad habit (cf. his admission: 'Je ne le ferais plus', and his denial: 'Albert n'a jamais fait ça'); (2) that with the onset of puberty the temptation to masturbate had revived with the tickling in his genitals; but (3) that a struggle for repression had broken out in him, which had suppressed his libido and transformed it into anxiety, and that the anxiety had taken over the punishments with which he had been threatened earlier.

And now let us see the inferences drawn by our author (*ibid.*, 69): 'The following conclusions can be drawn from this observation:

'(1) The influence of puberty upon a boy in delicate health can lead to a condition of great weakness and can result in a considerable degree of *cerebral anaemia*.¹

'(2) This cerebral anaemia produces character changes, demonomaniac hallucinations and very violent nocturnal (and perhaps also diurnal) anxiety-states.

'(3) The boy's demonomania and self-reproaches go back to the influences of his religious education, which affected him as a child.

'(4) All the symptoms disappeared in the course of a somewhat protracted visit to the country, as the result of physical exercise and the regaining of strength with the passage of puberty.

'(5) A predisposing influence upon the origin of the child's brain condition may perhaps be attributed to heredity and to a past syphilitic infection in his father.'

And here is the final conclusion: 'Nous avons fait entrer cette observation dans le cadre des délires apyrétiques d'inanition, car c'est à l'ischémie cérébrale que nous rattachons cet état particulier.'²

¹ The italics are mine.

² ['We have classified this case among the apyretic deliria of inanition, for we attribute this particular state to cerebral ischaemia.']

(E)

THE PRIMARY AND SECONDARY PROCESSES - REPRESSION

In venturing on an attempt to penetrate more deeply into the psychology of dream-processes, I have set myself a hard task and one to which my powers of exposition are scarcely equal. Elements in this complicated whole which are in fact simultaneous can only be represented successively in my description of them, while, in putting forward each point, I must avoid appearing to anticipate the grounds on which it is based: difficulties such as these it is beyond my strength to master. In all this I am paying the penalty for the fact that in my account of dream-psychology I have been unable to follow the historical development of my own views. Though my own line of approach to the subject of dreams was determined by my previous work on the psychology of the neuroses, I had not intended to make use of the latter as a basis of reference in the present work. Nevertheless I am constantly being driven to do so, instead of proceeding, as I should have wished, in the contrary direction and using dreams as a means of approach to the psychology of the neuroses. I am conscious of all the trouble in which my readers are thus involved, but I can see no means of avoiding it.

In my dissatisfaction at this state of things, I am glad to pause for a little over another consideration which seems to put a higher value on my efforts. I found myself faced by a topic on which, as has been shown in my first chapter, the opinions of the authorities were characterized by the sharpest contradictions. My treatment of the problems of dreams has found room for the majority of these contradictory views. I have only found it necessary to give a categorical denial of two of them - the view that dreaming is a meaningless process and the view that it is a somatic one. Apart from this, I have been able to find a justification for all these mutually contradictory opinions at one point or other of my complicated thesis and to show that they had lighted upon some portion of the truth.

The view that dreams carry on the occupations and interests of waking life has been entirely confirmed by the discovery of the concealed *dream-thoughts*. These are only concerned with what seems important to us and interests us greatly. Dreams are never occupied with minor details. But we have also found reason for accepting the contrary view, that dreams pick up indifferent refuse left over from the previous day and that they cannot get control of any major day time interest until it has been to some extent withdrawn from waking activity. We have found that this holds good of the dream's *content*, which gives expression to the dream-thoughts in a form modified by distortion. For reasons connected with the mechanism of association, as we have seen, the dream-process finds it easier to get control of recent or indifferent ideational material which has not yet been requisitioned by waking thought-activity; and for reasons of censorship it transfers psychical intensity from what is important but objectionable on to what is indifferent.

The fact that dreams are hypermnesic and have access to material from childhood has become one of the corner-stones of our teaching. Our theory of dreams regards wishes originating in infancy as the indispensable motive force for the formation of dreams.

It has naturally not occurred to us to throw any doubt on the significance, which has been experimentally demonstrated, of external sensory stimuli during sleep; but we have shown that such material stands in the same relation to the dream-wish as do the residues of thought left over from day time activity. Nor have we seen any reason to dispute the view that dreams interpret objective sensory stimuli just as illusions do; but we have found the motive which provides the reason for that interpretation, a reason which has been left unspecified by other writers. Interpretation is carried out in such a way that the object perceived shall not interrupt sleep and shall be usable for purposes of wish-fulfilment. As regards subjective states of excitation in the sense organs during sleep, the occurrence of which seems to have been proved by Trumbull Ladd, it is true that we have not accepted them as a particular source of dreams; but we have been able to explain them as resulting from the regressive revival of memories that are in operation behind the dream.

Internal organic sensations, which have commonly been taken as a cardinal point in explanations of dreaming, have retained a place, though a humbler one, in our theory. Such sensations - sensations of falling, for instance, or floating, or being inhibited - provide a material which is accessible at any time and of which the dream-work makes use, whenever it has need of it, for expressing the dream-thoughts.

The view that the dream-process is a rapid or instantaneous one is in our opinion correct as regards the perception by consciousness of the preconstructed dream-content; it seems probable that the preceding portions of the dream-process run a slow and fluctuating course. We have been able to contribute towards the solution of the riddle of dreams which contain a great amount of material compressed into the briefest moment of time; we have suggested that it is a question in such cases of getting hold of ready-made structures already present in the mind.

The fact that dreams are distorted and mutilated by memory is accepted by us but in our opinion constitutes no obstacle; for it is no more than the last and manifest portion of a distorting activity which has been in operation from the very start of the dream's formation.

As regards the embittered and apparently irreconcilable dispute as to whether the mind sleeps at night or is as much in command of all its faculties as it is by day, we have found that both parties are right but that neither is wholly right. We have found evidence in the dream-thoughts of a highly complex intellectual function, operating with almost the whole resources of the mental apparatus. Nevertheless it cannot be disputed that these dream-thoughts originated during the day, and it is imperative to assume that there is such a thing as a sleeping state of the mind. Thus even the theory of partial sleep has shown its value, though we have found that what characterizes the state of sleep is not the disintegration of mental bonds but the concentration of the psychical system which is in command during the day upon the wish to sleep. The factor of withdrawal from the external world retains its significance in our scheme; it helps, though not as the sole determinant, to make possible the regressive character of representation in dreams. The renunciation of voluntary direction of the flow of ideas cannot be disputed; but this does not deprive mental life of all purpose, for we have seen how, after voluntary purposive ideas have been abandoned, involuntary ones assume command. We have not merely accepted the fact of the looseness of associative connections in dreams, but we have shown that it extends far further than had been suspected; we have found, however, that these loose connections are merely obligatory substitutes for others which are valid and significant. It is quite true that we have described dreams as absurd; but examples have taught us how sensible a dream can be even when it appears to be absurd.

We have no difference of opinion over the functions that are to be assigned to dreams. The view that dreams act as a safety valve to the mind and that, in the words of Robert, all kinds of harmful things are made harmless by being presented in a dream - not only does this view coincide exactly with our theory of the double wish-fulfilment brought about by dreams, but the way in which it is phrased is more intelligible to us than to Robert himself. The view that the mind has free play in its functioning in dreams is represented in our theory by the fact of the preconscious activity allowing dreams to take their course. Such phrases as 'the return of the mind in dreams to an embryonic point of view' or the words used by Havelock Ellis to describe dreams - 'an archaic world of vast emotions and imperfect thoughts' - strike us as happy anticipations of our own assertions that primitive modes of activity which are suppressed during the day are concerned in the construction of dreams. We have been able to accept entirely as our own what Sully has written: 'Our dreams are a means of conserving these successive personalities. When asleep we go back to the old ways of looking at things and of feeling about them, to impulses and activities which long ago dominated us'. For us no less than for Delage what has been 'suppressed' has become 'the motive force of dreams.'

We have fully appreciated the importance of the part ascribed by Scherner to 'dream-imagination', as well as Scherner's own interpretations, but we have been obliged to transport them, as it were, to a different position in the problem. The point is not that dreams create the imagination, but rather that the unconscious activity of the imagination has a large share in the construction of the dream-thoughts. We remain in Scherner's debt for having indicated the source of the dream-thoughts; but nearly everything that he ascribes to the dream-work is really attributable to the activity of the unconscious during daytime, which is the instigating agent of dreams no less than of neurotic symptoms. We have been obliged to distinguish the 'dream-work' as something quite different and with a much narrower connotation.

Finally, we have by no means abandoned the relation between dreams and mental disorders, but have established it more firmly on fresh ground.

We have thus been able to find a place in our structure for the most various and contradictory findings of earlier writers, thanks to the novelty of our theory of dreams, which combines them, as it were, into a higher unity. Some of those findings we have put to other uses, but we have wholly rejected only a few. Nevertheless our edifice is still uncompleted. Apart from the many perplexing questions in which we have become involved in making our way into the obscurities of psychology, we seem to be troubled by a fresh contradiction. On the one hand we have supposed that the dream-thoughts arise through entirely normal mental activity; but on the other hand we have discovered a number of quite abnormal processes of thought among the dream-thoughts, which extend into the dream-content, and which we then repeat in the course of our dream-interpretation. Everything that we have described as the 'dream-work' seems to depart so widely from what we recognize as rational thought-processes that the most severe strictures passed by earlier writers on the low level of psychical functioning in dreams must appear fully justified.

It may be that we shall only find enlightenment and assistance in this difficulty by carrying our investigation still further. And I will begin by picking out for closer examination one of the conjunctures which may lead to the formation of a dream.

A dream, as we have discovered, takes the place of a number of thoughts which are derived from our daily life and which form a completely logical sequence. We cannot doubt, then, that these thoughts originate from our normal mental life. All the attributes which we value highly in our trains of thought, and which characterize them as complex achievements of a high order, are to be found once more in dream-thoughts. There is no need to assume, however, that this activity of thought is performed during sleep - a possibility which would gravely confuse what has hitherto been our settled picture of the psychical state of sleep. On the contrary, these thoughts may very well have originated from the previous day, they may have proceeded unobserved by our consciousness from their start, and may already have been completed at the onset of sleep. The most that we can conclude from this is that it proves that *the most complicated achievements of thought are possible without the assistance of consciousness* - a fact which we could not fail to learn in any case from every psycho-analysis of a patient suffering from hysteria or from obsessional ideas. These dream-thoughts are certainly not in themselves inadmissible to consciousness; there may have been a number of reasons for their not having become conscious to us during the day. Becoming conscious is connected with the application of a particular psychical function, that of attention - a function which, as it seems, is only available in a specific quantity, and this may have been diverted from the train of thought in question on to some other purpose. There is another way, too, in which trains of thought of this kind may be withheld from consciousness. The course of our conscious reflections shows us that we follow a particular path in our application of attention. If, as we follow this path, we come upon an idea which will not bear criticism, we break off: we drop the cathexis of attention. Now it seems that the train of thought which has thus been initiated and dropped can continue to spin itself out without attention being turned to it again, unless at some point or other it reaches a specially high degree of intensity which forces attention to it. Thus, if a train of thought is initially rejected (consciously, perhaps) by a judgement that it is wrong or that it is useless for the immediate intellectual purposes in view, the result may be that this train of thought will proceed, unobserved by consciousness, until the onset of sleep.

To sum up - we describe a train of thought such as this as 'preconscious'; we regard it as completely rational and believe that it may either have been simply neglected or broken off and suppressed. Let us add a frank account of how we picture the occurrence of a train of ideas. We believe that, starting from a purposive idea, a given amount of excitation, which we term 'cathectic energy', is displaced along the associative paths selected by that purposive idea. A train of thought which is 'neglected' is one which has *not received* this cathexis; a train of thought which is 'suppressed' or 'repudiated' is one from which this cathexis has been *withdrawn*. In both cases they are left to their own excitations. Under certain conditions a train of thought with a purposive cathexis is capable of attracting the attention of consciousness to itself and in that event, through the agency of consciousness, receives a 'hypercathexis.' We shall be obliged presently to explain our view of the nature and function of consciousness.

A train of thought that has been set going like this in the preconscious may either cease spontaneously or persist. We picture the first of these outcomes as implying that the energy attaching to the train of thought is diffused along all the associative paths that radiate from it; this energy sets the whole network of thoughts in a state of excitation which lasts for a certain time and then dies away as the excitation in search of discharge becomes transformed into a quiescent cathexis. If this first outcome supervenes, the process is of no further significance so far as dream-formation is concerned. Lurking in our preconscious, however, there are other purposive ideas, which are derived from sources in our unconscious and from wishes which are always on the alert. These may take control of the excitation attaching to the group of thoughts which has been left to its own devices, they may establish a connection between it and an unconscious wish, and they may 'transfer' to it the energy belonging to the unconscious wish. Thenceforward the neglected or suppressed train of thought is in a position to persist, though the reinforcement it has received gives it no right of entry into consciousness. We may express this by saying that what has hitherto been a preconscious train of thought has now been 'drawn into the unconscious.'

There are other conjunctures which may lead to the formation of a dream. The preconscious train of thought may have been linked to the unconscious wish from the first and may for that reason have been repudiated by the dominant purposive cathexis; or an unconscious wish may become active for other reasons (from somatic causes, perhaps) and may seek to effect a transference on to the psychical residues that are uncathexed by the Pcs. without their coming halfway to meet it. But all three cases have the same final outcome: a train of thought comes into being in the preconscious which is without a preconscious cathexis but has received a cathexis from an unconscious wish.

From this point onwards the train of thought undergoes a series of transformations which we can no longer recognize as normal psychical processes and which lead to a result that bewilders us - a psychopathological structure. I will enumerate these processes and classify them.

(1) The intensities of the individual ideas become capable of discharge *en bloc* and pass over from one idea to another, so that certain ideas are formed which are endowed with great intensity. And since this process is repeated several times, the intensity of a whole train of thought may eventually be concentrated in a single ideational element. Here we have the fact of 'compression' or 'condensation', which has become familiar in the dream-work. It is this that is mainly responsible for the bewildering impression made on us by dreams, for nothing at all analogous to it is known to us in mental life that is normal and accessible to consciousness. In normal mental life too, we find ideas which, being the nodal points or end results of whole chains of thought, possess a high degree of psychical significance; but their significance is not expressed by any feature that is obvious in a *sensory* manner to internal perception; their perceptual presentation is not in any respect more intense on account of their psychical significance. In the process of condensation, on the other hand, every psychical interconnection is transformed into an *intensification* of its ideational content. The case is the same as when, in preparing a book for the press, I have some word which is of special importance for understanding the text printed in spaced or heavy type; or in speech I should pronounce the same word loudly and slowly and with special emphasis. The first of these two analogies reminds us at once of an example provided by the dream-work itself: the word '*trimethylamin*' in the dream of Irma's injection. Art historians have drawn our attention to the fact that the earliest historical sculptures obey a similar principle: they express the rank of the persons represented by their size. A king is represented twice or three times as large as his attendants or as his defeated enemies. A sculpture of Roman date would make use of subtler means for producing the same result. The figure of the Emperor would be placed in the middle, standing erect, and would be modelled with especial care, while his enemies would be prostrate at his feet; but he would no longer be a giant among dwarfs. The bows with which inferiors greet their superiors among ourselves to-day are an echo of the same ancient principle of representation.

The direction in which condensations in dreams proceed is determined on the one hand by the rational preconscious relations of the dream-thoughts, and on the other by the attraction exercised by visual memories in the unconscious. The outcome of the activity of condensation is the achievement of the intensities required for forcing a way through into the perceptual systems.

(2) Owing, once more, to the freedom with which the intensities can be transferred, 'intermediate ideas', resembling compromises, are constructed under the sway of condensation. (Cf. the numerous instances I have given of this.) This is again something unheard-of in normal chains of ideas, where the main stress is laid on the selection and retention of the 'right' ideational element. On the other hand, composite structures and compromises occur with remarkable frequency when we try to express preconscious thoughts in speech. They are then regarded as species of 'slips of the tongue.'

(3) The ideas which transfer their intensities to each other stand in the loosest mutual relations. They are linked by associations of a kind that is scorned by our normal thinking and relegated to the use of jokes. In particular, we find associations based on homonyms and verbal similarities treated as equal in value to the rest.

(4) Thoughts which are mutually contradictory make no attempt to do away with each other, but persist side by side. They often combine to form condensations, just as though there were no contradiction between them, or arrive at compromises such as our conscious thoughts would never tolerate but such as are often admitted in our actions.

These are some of the most striking of the abnormal processes to which the dream-thoughts, previously constructed on rational lines, are subjected in the course of the dream-work. It will be seen that the chief characteristic of these processes is that the whole stress is laid upon making the cathecting energy mobile and capable of discharge; the content and the proper meaning of the psychical elements to which the cathexes are attached are treated as of little consequence. It might have been supposed that condensation and the formation of compromises is only carried out for the sake of facilitating regression, that is, when it is a question of transforming thoughts into images. But the analysis - and still more the synthesis - of dreams which include no such regression to images, e.g. the dream of 'Autodidasker', exhibits the same processes of displacement and condensation as the rest.

Thus we are driven to conclude that two fundamentally different kinds of psychical process are concerned in the formation of dreams. One of these produces perfectly rational dream-thoughts, of no less validity than normal thinking; while the other treats these thoughts in a manner which is in the highest degree bewildering and irrational. We have already in Chapter VI segregated this second psychical process as being the dream-work proper. What light have we now to throw upon its origin?

It would not be possible for us to answer this question if we had not made some headway in the study of the psychology of the neuroses, and particularly of hysteria. We have found from this that the same irrational psychical processes, and others that we have not specified, dominate the production of hysterical symptoms. In hysteria, too, we come across a series of perfectly rational thoughts, equal in validity to our conscious thoughts; but to begin with we know nothing of their existence in this form and we can only reconstruct them subsequently. If they force themselves upon our notice at any point, we discover by analysing the symptom which has been produced that these normal thoughts have been submitted to abnormal treatment: *they have been transformed into the symptom by means of condensation and the formation of compromises, by way of superficial associations and in disregard of contradictions, and also, it may be, along the path of regression.* In view of the complete identity between the characteristic features of the dream-work and those of the psychical activity which issues in psychoneurotic symptoms, we feel justified in carrying over to dreams the conclusions we have been led to by hysteria.

We accordingly borrow the following thesis from the theory of hysteria: *a normal train of thought is only submitted to abnormal psychical treatment of the sort we have been describing if an unconscious wish, derived from infancy and in a state of repression has been transferred on to it.* In accordance with this thesis we have constructed our theory of dreams on the assumption that the dream-wish which provides the motive power invariably originates from the unconscious - an assumption which, as I myself am ready to admit, cannot be proved to hold generally, though neither can it be disproved. But in order to explain what is meant by 'repression', a term with which we have already made play so many times, it is necessary to proceed a stage further with our psychological scaffolding.

We have already explored the fiction of a primitive psychical apparatus whose activities are regulated by an effort to avoid an accumulation of excitation and to maintain itself so far as possible without excitation. For that reason it is built upon the plan of a reflex apparatus. The power of movement, which is in the first instance a means of bringing about internal alterations in its body, is at its disposal as the path to discharge. We went on to discuss the psychical consequences of an 'experience of satisfaction'; and in that connection we were already able to add a second hypothesis, to the effect that the accumulation of excitation (brought about in various ways that need not concern us) is felt as unpleasure and that it sets the apparatus in action with a view to repeating the experience of satisfaction, which involved a diminution of excitation and was felt as pleasure. A current of this kind in the apparatus, starting from unpleasure and aiming at pleasure, we have termed a 'wish'; and we have asserted that only a wish is able to set the apparatus in motion and that the course of the excitation in it is automatically regulated by feelings of pleasure and unpleasure. The first wishing seems to have been a hallucinatory cathecting of the memory of satisfaction. Such hallucinations, however, if they were not to be maintained to the point of exhaustion, proved to be inadequate to bring about the cessation of the need or, accordingly, the pleasure attaching to satisfaction.

A second activity - or, as we put it, the activity of a second system - became necessary, which would not allow the mnemonic cathexis to proceed as far as perception and from there to bind the psychical forces; instead, it diverted the excitation arising from the need along a roundabout path which ultimately, by means of voluntary movement, altered the external world in such a way that it became possible to arrive at a real perception of the object of satisfaction. We have already outlined our schematic picture of the psychical apparatus up to this point; the two systems are the germ of what, in the fully developed apparatus, we have described as the *Ucs.* and *Pcs.*

In order to be able to employ the power of movement to make alterations in the external world that shall be effective, it is necessary to accumulate a great number of experiences in the mnemonic systems and a multiplicity of permanent records of the associations called up in this mnemonic material by different purposive ideas. We can now carry our hypotheses a step further. The activity of this second system, constantly feeling its way, and alternately sending out and withdrawing cathexes, needs on the one hand to have the whole of the material of memory freely at its command; but on the other hand it would be an unnecessary expenditure of energy if it sent out large quantities of cathexis along the various paths of thought and thus caused them to drain away to no useful purpose and diminish the quantity available for altering the external world. I therefore postulate that for the sake of efficiency the second system succeeds in retaining the major part of its cathexes of energy in a state of quiescence and in employing only a small part on displacement. The mechanics of these processes are quite unknown to me; anyone who wished to take these ideas seriously would have to look for physical analogies to them and find a means of picturing the movements that accompany excitation of neurones. All that I insist upon is the idea that the activity of the *first* Ψ -system is directed towards securing the *free discharge* of the quantities of excitation, while the *second* system, by means of the cathexes emanating from it, succeeds in *inhibiting* this discharge and in transforming the cathexis into a quiescent one, no doubt with a simultaneous raising of its level. I presume, therefore, that under the dominion of the second system the discharge of excitation is governed by quite different mechanical conditions from those in force under the dominion of the first system. When once the second system has concluded its exploratory thought-activity, it releases the inhibition and damming-up of the excitations and allows them to discharge themselves in movement.

Some interesting reflections follow if we consider the relations between this inhibition upon discharge exercised by the second system and the regulation effected by the unpleasure principle. Let us examine the antithesis to the primary experience of satisfaction - namely, the experience of an external fright. Let us suppose that the primitive apparatus is impinged upon by a perceptual stimulus which is a source of painful excitation. Unco-ordinated motor manifestations will follow until one of them withdraws the apparatus from the perception and at the same time from the pain. If the perception reappears, the movement will at once be repeated (a movement of flight, it may be) till the perception has disappeared once more. In this case, no inclination will remain to recathect the perception of the source of pain, either hallucinatorily or in any other way. On the contrary, there will be an inclination in the primitive apparatus to drop the distressing mnemonic image immediately, if anything happens to revive it, for the very reason that if its excitation were to overflow into perception it would provoke unpleasure (or, more precisely, would *begin* to provoke it). The avoidance of the memory, which is no more than a repetition of the previous flight from the perception, is also facilitated by the fact that the memory, unlike the perception, does not possess enough quality to excite consciousness and thus to attract fresh cathexis to itself. This effortless and regular avoidance by the psychical process of the memory of anything that had once been distressing affords us the prototype and first example of *psychical repression*. It is a familiar fact that much of this avoidance of what is distressing - this ostrich policy - is still to be seen in the normal mental life of adults.

As a result of the unpleasure principle, then, the first Ψ -system is totally incapable of bringing anything disagreeable into the context of its thought. It is unable to do anything but wish. If things remained at that point, the thought-activity of the second system would be obstructed, since it requires free access to *all* the memories laid down by experience. Two possibilities now present themselves. Either the activity of the second system might set itself entirely free from the unpleasure principle and proceed without troubling about unpleasure of memories; or it might find a method of cathecting unpleasurable memories which would enable it to avoid releasing the unpleasure. We may dismiss the first of these possibilities, for the unpleasure principle clearly regulates the course of excitation in the second system as much as in the first. We are consequently left with the remaining possibility that the second system cathects memories in such a way that there is an inhibition of their discharge, including, therefore, an inhibition of discharge (comparable to that of a motor innervation) in the direction of the development of unpleasure. We have therefore been led from two directions to the hypothesis that cathexis by the second system implies a simultaneous inhibition of the discharge of excitation: we have been led to it by regard for the unpleasure principle and also by the principle of the least expenditure of innervation. Let us bear this firmly in mind, for it is the key to the whole theory of repression: *the second system can only cathect an idea if it is in a position to inhibit any development of unpleasure that may proceed from it*. Anything that could evade that inhibition would be inaccessible to the second system as well as to the first; for it would promptly be dropped in obedience to the unpleasure principle. The inhibition of unpleasure need not, however, be a complete one: a beginning of it must be allowed, since that is what informs the second system of the nature of the memory concerned and of its possible unsuitability for the purpose which the thought-process has in view.

I propose to describe the psychical process of which the first system alone admits as the 'primary process', and the process which results from the inhibition imposed by the second system as the 'secondary process'.

There is yet another reason for which, as I can show, the second system is obliged to correct the primary process. The primary process endeavours to bring about a discharge of excitation in order that, with the help of the amount of excitation thus accumulated, it may establish a 'perceptual identity'. The secondary process, however, has abandoned this intention and taken on another in its place - the establishment of a '*thought* identity'. All thinking is no more than a circuitous path from the memory of a satisfaction (a memory which has been adopted as a purposive idea) to an identical cathexis of the same memory which it is hoped to attain once more through an intermediate stage of motor experiences. Thinking must concern itself with the connecting paths between ideas, without being led astray by the *intensities* of those ideas. But it is obvious that condensations of ideas, as well as intermediate and compromise structures, must obstruct the attainment of the identity aimed at. Since they substitute one idea for another, they cause a deviation from the path which would have led on from the first idea. Processes of this kind are therefore scrupulously avoided in secondary thinking. It is easy to see, too, that the unpleasure principle, which in other respects supplies the thought-process with its most important signposts, puts difficulties in its path towards establishing 'thought identity'. Accordingly, thinking must aim at freeing itself more and more from exclusive regulation by the unpleasure principle and at restricting the development of affect in thought-activity to the minimum required for acting as a signal. The achievement of this greater delicacy in functioning is aimed at by means of a further hypercathexis, brought about by consciousness. As we well know, however, that aim is seldom attained completely, even in normal mental life, and our thinking always remains exposed to falsification by interference from the unpleasure principle.

This, however, is not the gap in the functional efficiency of our mental apparatus which makes it possible for thoughts, which represent themselves as products of the secondary thought activity, to become subject to the primary psychical process - for such is the formula in which we can now describe the activity which leads to dreams and to hysterical symptoms. Inefficiency arises from the convergence of two factors derived from our developmental history. One of these factors devolves entirely upon the mental apparatus and has had a decisive influence on the relation between the two systems, while the other makes itself felt to a variable degree and introduces instinctual forces of organic origin into mental life. Both of them originate in childhood and are a precipitate of the modifications undergone by our mental and somatic organism since our infancy.

When I described one of the psychical processes occurring in the mental apparatus as the 'primary' one, what I had in mind was not merely considerations of relative importance and efficiency; I intended also to choose a name which would give an indication of its chronological priority. It is true that, so far as we know, no psychical apparatus exists which possesses a primary process only and that such an apparatus is to that extent a theoretical fiction. But this much is a fact: the primary processes are present in the mental apparatus from the first, while it is only during the course of life that the secondary processes unfold, and come to inhibit and overlay the primary ones; it may even be that their complete domination is not attained until the prime of life. In consequence of the belated appearance of the secondary processes, the core of our being, consisting of unconscious wishful impulses, remains inaccessible to the understanding and inhibition of the preconscious; the part played by the latter is restricted once and for all to directing along the most expedient paths the wishful impulses that arise from the unconscious. These unconscious wishes exercise a compelling force upon all later mental trends, a force which those trends are obliged to fall in with or which they may perhaps endeavour to divert and direct to higher aims. A further result of the belated appearance of the secondary process is that a wide sphere of mnemonic material is inaccessible to preconscious cathexis.

Among these wishful impulses derived from infancy, which can neither be destroyed nor inhibited, there are some whose fulfilment would be a contradiction of the purposive ideas of secondary thinking. The fulfilment of these wishes would no longer generate an affect of pleasure but of unpleasure; and *it is precisely this transformation of affect which constitutes the essence of what we term 'repression'*. The problem of repression lies in the question of how it is and owing to what motive forces that this transformation occurs; but it is a problem that we need only touch upon here. It is enough for us to be clear that a transformation of this kind does occur in the course of development - we have only to recall the way in which disgust emerges in childhood after having been absent to begin with - and that it is related to the activity of the secondary system. The memories on the basis of which the unconscious wish brings about the release of affect were never accessible to the *Pcs.*, and consequently the release of the affect attaching to those memories cannot be inhibited either. It is for the very reason of this generation of affect that these ideas are now inaccessible even by way of the preconscious thoughts on to which they have transferred their wishful force. On the contrary, the unpleasure principle takes control and causes the *Pcs.* to turn away from the transference thoughts. They are left to themselves - 'repressed' - and thus it is that the presence of a store of infantile memories, which has from the first been held back from the *Pcs.*, becomes a *sine qua non* for repression.

In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the *Pcs.*; and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their excitation, even if they have lost their cathexis from the *Pcs.* There then follows a defensive struggle - for the *Pcs.* in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis') - and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathected by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychological process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychological apparatus are the *primary* ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not in fact falsifications of normal processes - intellectual errors - but are modes of activity of the psychological apparatus that have been freed from an inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a *comic* effect, that is, a surplus of energy which has to be discharged in *laughter*, if we allow these modes of thinking to force their way through into consciousness.

The theory of the psychoneuroses asserts as an indisputable and invariable fact that only sexual wishful impulses from infancy, which have undergone repression (i.e. a transformation of their affect) during the developmental period of childhood, are capable of being revived during *later* developmental periods (whether as a result of the subject's sexual constitution, which is derived from an initial bisexuality, or as a result of unfavourable influences acting upon the course of his sexual life) and are thus able to furnish the motive force for the formation of psychoneurotic symptoms of every kind. It is only by reference to these sexual forces that we can close the gaps that are still patent in the theory of repression. I will leave it an open question whether these sexual and infantile factors are equally required in the theory of dreams: I will leave that theory incomplete at this point, since I have already gone a step beyond what can be demonstrated in assuming that dream-wishes are invariably derived from the unconscious.¹ Nor do I propose to enquire further into the nature of the distinction between the play of psychical forces in the formation of dreams and in that of hysterical symptoms: we are still without a sufficiently accurate knowledge of one of the two objects of the comparison.

¹ Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words 'suppressed' and 'repressed.' It should have been clear, however, that the latter lays more stress than the former upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream-thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one. And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the *Oneirocritica* of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion.

There is, however, another point to which I attach importance; and I must confess that it is solely on its account that I have embarked here upon all these discussions of the two psychical systems and their modes of activity and of repression. It is not now a question of whether I have formed an approximately correct opinion of the psychological factors with which we are concerned, or whether, which is quite possible in such difficult matters, my picture of them is distorted and incomplete. However many changes may be made in our reading of the psychical censorship and of the rational and abnormal revisions made of the dream-content, it remains true that processes of this sort are at work in the formation of dreams and that they show the closest analogy in their essentials to the processes observable in the formation of hysterical symptoms. A dream, however, is no pathological phenomenon; it presupposes no disturbance of psychical equilibrium; it leaves behind it no loss of efficiency. The suggestion may be made that no conclusions as to the dreams of normal people can be drawn from my dreams or those of my patients; but this, I think, is an objection which can be safely disregarded. If, then, we may argue back from the phenomena to their motive forces, we must recognize that the psychical mechanism employed by neuroses is not created by the impact of a pathological disturbance upon the mind but is present already in the normal structure of the mental apparatus. The two psychical systems, the censorship upon the passage from one of them to the other, the inhibition and overlaying of one activity by the other, the relations of both of them to consciousness - or whatever more correct interpretations of the observed facts may take their place - all of these form part of the normal structure of our mental instrument, and dreams show us one of the paths leading to an understanding of its structure. If we restrict ourselves to the minimum of new knowledge which has been established with certainty, we can still say this of dreams: they have proved that *what is suppressed continues to exist in normal people as well as abnormal, and remains capable of psychical functioning*. Dreams themselves are among the manifestations of this suppressed material; this is so theoretically in every case, and it can be observed empirically in a great number of cases at least, and precisely in cases which exhibit most clearly the striking peculiarities of dream-life. In waking life the suppressed material in the mind is prevented from finding expression and is cut off from internal perception owing to the fact that the contradictions present in it are eliminated - one side being disposed of in favour of the other; but during the night, under the sway of an impetus towards the construction of compromises, this suppressed material finds methods and means of forcing its way into consciousness.

Flectere si nequeo superos, Acheronta movebo.¹

The interpretation of dreams is the royal road to a knowledge of the unconscious activities of the mind.

By analysing dreams we can take a step forward in our understanding of the composition of that most marvellous and most mysterious of all instruments. Only a small step, no doubt; but a beginning. And this beginning will enable us to proceed further with its analysis, on the basis of other structures which must be termed pathological. For illnesses - those, at least, which are rightly named 'functional' - do not presuppose the disintegration of the apparatus or the production of fresh splits in its interior. They are to be explained on a *dynamic* basis - by the strengthening and weakening of the various components in the interplay of forces, so many of whose effects are hidden from view while functions are normal. I hope to be able to show elsewhere how the compounding of the apparatus out of two agencies makes it possible for the normal mind too to function with greater delicacy than would be possible with only one of them.²

¹ ['If I cannot bend the Higher Powers, I will move the Infernal Regions.']

² Dreams are not the only phenomena which allow us to find a basis for psychopathology in psychology. In a short series of papers (1898*b* and 1899*a*) which is not yet completed, I have attempted to interpret number of phenomena of daily life as evidence in favour of the same conclusions. [Added 1909:] These, together with some further papers on forgetting, slips of the tongue, bungled actions, etc., have since been collected under the title of *The Psychopathology of Everyday Life* (1901*b*).

(F)

THE UNCONSCIOUS AND CONSCIOUSNESS - REALITY

It will be seen on closer consideration that what the psychological discussion in the preceding sections invites us to assume is not the existence of two *systems* near the motor end of the apparatus but the existence of two kinds of *processes of excitation* or *modes of its discharge*. It is all one to us, for we must always be prepared to drop our conceptual scaffolding if we feel that we are in a position to replace it by something that approximates more closely to the unknown reality. So let us try to correct some conceptions which might be misleading so long as we looked upon the two systems in the most literal and crudest sense as two localities in the mental apparatus - conceptions which have left their traces in the expressions 'to repress' and 'to force a way through.' Thus, we may speak of an unconscious thought seeking to convey itself into the preconscious so as to be able then to force its way through into consciousness. What we have in mind here is not the forming of a second thought situated in a new place, like a transcription which continues to exist alongside the original; and the notion of forcing a way through into consciousness must be kept carefully free from any idea of a change of locality. Again, we may speak of a preconscious thought being repressed or driven out and then taken over by the unconscious. These images, derived from a set of ideas relating to a struggle for a piece of ground, may tempt us to suppose that it is literally true that a mental grouping in one locality has been brought to an end and replaced by a fresh one in another locality. Let us replace these metaphors by something that seems to correspond better to the real state of affairs, and let us say instead that some particular mental grouping has had a cathexis of energy attached to it or withdrawn from it, so that the structure in question has come under the sway of a particular agency or been withdrawn from it. What we are doing here is once again to replace a topographical way of representing things by a dynamic one. What we regard as mobile is not the psychical structure itself but its innervation.¹

Nevertheless, I consider it expedient and justifiable to continue to make use of the figurative image of the two systems. We can avoid any possible abuse of this method of representation by recollecting that ideas, thoughts and psychical structures in general must never be regarded as localized in organic elements of the nervous system but rather, as one might say, *between* them, where resistances and facilitations [*Bahnungen*] provide the corresponding correlates. Everything that can be an object of our internal perception is *virtual*, like the image produced in a telescope by the passage of light-rays. But we are justified in assuming the existence of the systems (which are not in any way psychical entities themselves and can never be accessible to our psychical perception) like the lenses of the telescope, which cast the image. And, if we pursue this analogy, we may compare the censorship between two systems to the refraction which takes place when a ray of light passes into a new medium.

¹ [Footnote added 1925:] It became necessary to elaborate and modify thus view after it was recognized that the essential feature of a preconscious idea was the fact of its being connected with the residues of verbal presentations. Cf. 'The Unconscious' (1915e).

So far we have been psychologizing on our own account. It is time now to consider the theoretical views which govern present-day psychology and to examine their relation to our hypotheses. The problem of the unconscious in psychology is, in the forcible words of Lipps (1897), less a psychological problem than *the* problem of psychology. So long as psychology dealt with this problem by a verbal explanation to the effect that 'psychical' *meant* 'conscious' and that to speak of 'unconscious psychical processes' was palpable nonsense, any psychological evaluation of the observations made by physicians upon abnormal mental states was out of the question. The physician and the philosopher can only come together if they both recognize that the term 'unconscious psychical processes' is 'the appropriate and justified expression of a solidly established fact'. The physician can only shrug his shoulders when he is assured that 'consciousness is an indispensable characteristic of what is psychical', and perhaps, if he still feels enough respect for the utterances of philosophers, he may presume that they have not been dealing with the same thing or working at the same science. For even a single understanding observation of a neurotic's mental life or a single analysis of a dream must leave him with an unshakeable conviction that the most complicated and most rational thought-processes, which can surely not be denied the name of psychical processes, can occur without exciting the subject's consciousness.¹ It is true that the physical cannot learn of these unconscious processes until they have produced some effect upon consciousness which can be communicated or observed. But this conscious effect may exhibit a psychical character quite different from that of the unconscious process, so that internal perception cannot possibly regard the one as a substitute for the other. The physician must feel at liberty to proceed by *inference* from the conscious effect to the unconscious psychical process. He thus learns that the conscious effect is only a remote psychical result of the unconscious process and that the latter has not become conscious as such; and moreover that the latter was present and operative even without betraying its existence in any way to consciousness.

¹ [Footnote added 1914:] I am happy to be able to point to an author who has drawn from the study of dreams the same conclusions as I have on the relation between conscious and unconscious activity. Du Prel (1885, 47) writes: 'The problem of the nature of the mind evidently calls for a preliminary investigation as to whether consciousness and mind are identical. This preliminary question is answered in the negative by dreams, which show that the concept of the mind is a wider one than that of consciousness, in the same kind of way in which the gravitational force of a heavenly body extends beyond its range of luminosity.' And again (ibid., 306): 'It is a truth which cannot be too distinctly borne in mind that consciousness is not co-extensive with mind.'

It is essential to abandon the overvaluation of the property of being conscious before it becomes possible to form any correct view of the origin of what is mental. In Lipps's words, the unconscious must be assumed to be the general basis of psychical life. The unconscious is the larger sphere, which includes within it the smaller sphere of the conscious. Everything conscious has an unconscious preliminary stage; whereas what is unconscious may remain at that stage and nevertheless claim to be regarded as having the full value of a psychical process. The unconscious is the true psychical reality; *in its innermost nature it is as much unknown to us as the reality of the external world, and it is as incompletely presented by the data of consciousness as is the external world by the communications of our sense organs.*

Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini's sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

It would scarcely repay the trouble if we were to treat the historical significance of dreams as a separate topic. A dream may have impelled some chieftain to embark upon a bold enterprise the success of which has changed history. But this only raises a fresh problem so long as a dream is regarded as an alien power in contrast to the other more familiar forces of the mind; no such problem remains if a dream is recognized as a *form of expression* of impulses which are under the pressure of resistance during the day but which have been able to find reinforcement during the night from deep-lying sources of excitation.¹ The respect paid to dreams in antiquity is, however, based upon correct psychological insight and is the homage paid to the uncontrolled and indestructible forces in the human mind, to the 'daemonic' power which produces the dream-wish and which we find at work in our unconscious.

It is not without intention that I speak of 'our' unconscious. For what I thus describe is not the same as the unconscious of the philosophers or even the unconscious of Lipps. By them the term is used merely to indicate a contrast with the conscious: the thesis which they dispute with so much heat and defend with so much energy is the thesis that apart from conscious there are also unconscious psychical processes. Lipps carries things further with his assertion that the whole of what is psychical exists unconsciously and that a part of it also exists consciously. But it is not in order to establish *this* thesis that we have summoned up the phenomena of dreams and of the formation of hysterical symptoms; the observation of normal waking life would by itself suffice to prove it beyond any doubt. The new discovery that we have been taught by the analysis of psychopathological structures and of the first member of that class - the dream - lies in the fact that the unconscious (that is, the psychical) is found as a function of two separate systems and that this is the case in normal as well as in pathological life. Thus there are two kinds of unconscious, which have not yet been distinguished by psychologists. Both of them are unconscious in the sense used by psychology; but in our sense one of them, which we term the *Ucs.*, is also *inadmissible to consciousness*, while we term the other the *Pcs.* because its excitations - after observing certain rules, it is true, and perhaps only after passing a fresh censorship, though nonetheless without regard to the *Ucs.* - are able to reach consciousness. The fact that excitations in order to reach consciousness must pass through a fixed series or hierarchy of agencies (which is revealed to us by the modifications made in them by censorship) has enabled us to construct a spatial analogy. We have described the relations of the two systems to each other and to consciousness by saying that the system *Pcs.* stands like a screen between the system *Ucs.* and consciousness. The system *Pcs.* not merely bars access to consciousness, it also controls access to the power of voluntary movement and has at its disposal for distribution a mobile cathectic energy, a part of which is familiar to us in the form of attention.²

¹ [Footnote added 1911:] Cf. in this connection Alexander the Great's dream during his siege of Tyre ().

² [Footnote added 1914:] Cf. my remarks on the concept of the unconscious in psycho-analysis (Freud, 1912g), first published in English in the Proceedings of the Society for Psychical Research, 26, in which I have distinguished the descriptive, dynamic and systematic meanings of the highly ambiguous word 'unconscious'.

We must avoid, too, the distinction between 'supraconscious' and 'subconscious', which has become so popular in the more recent literature of the psychoneuroses, for such a distinction seems precisely calculated to stress the equivalence of what is psychical to what is conscious.

But what part is there left to be played in our scheme by consciousness, which was once so omnipotent and hid all else from view? *Only that of a sense-organ for the perception of psychical qualities.* In accordance with the ideas underlying our attempt at a schematic picture, we can only regard conscious perception as the function proper to a particular system; and for this the abbreviation Cs. seems appropriate. In its mechanical properties we regard this system as resembling the perceptual systems *Pcpt.*: as being susceptible to excitation by qualities but incapable of retaining traces of alterations - that is to say, as having no memory. The psychical apparatus, which is turned towards the external world with its sense-organ of the *Pcpt.* systems, is itself the external world in relation to the sense-organ of the Cs., whose teleological justification resides in this circumstance. Here we once more meet the principle of the hierarchy of agencies, which seems to govern the structure of the apparatus. Excitatory material flows in to the Cs. sense-organ from two directions: from the *Pcpt.* system, whose excitation, determined by qualities, is probably submitted to a fresh revision before it becomes a conscious sensation, and from the interior of the apparatus itself, whose quantitative processes are felt qualitatively in the pleasure-unpleasure series when, subject to certain modifications, they make their way to consciousness.

Those philosophers who have become aware that rational and highly complex thought-structures are possible without consciousness playing any part in them have found difficulty in assigning any function to consciousness; it has seemed to them that it can be no more than a superfluous reflected picture of the completed psychical process. We, on the other hand, are rescued from this embarrassment by the analogy between our *Cs.* system and the perceptual systems. We know that perception by our sense-organs has the result of directing a cathexis of attention to the paths along which the in-coming sensory excitation is spreading: the qualitative excitation of the *Pcpt.* system acts as a regulator of the discharge of the mobile quantity in the psychical apparatus. We can attribute the same function to the overlying sense-organ of the *Cs.* system. By perceiving new qualities, it makes a new contribution to directing the mobile quantities of cathexis and distributing them in an expedient fashion. By the help of its perception of pleasure and unpleasure it influences the discharge of the cathexes within what is otherwise an unconscious apparatus operating by means of the displacement of quantities. It seems probable that in the first instance the unpleasure principle regulates the displacement of cathexes automatically. But it is quite possible that consciousness of these qualities may introduce in addition a second and more discriminating regulation, which is even able to oppose the former one, and which perfects the efficiency of the apparatus by enabling it, in contradiction to its original plan, to cathect and work over even what is associated with the release of unpleasure. We learn from the psychology of the neuroses that these processes of regulation carried out by the qualitative excitation of the sense organs play a great part in the functional activity of the apparatus. The automatic domination of the primary unpleasure principle and the consequent restriction imposed upon efficiency are interrupted by the processes of sensory regulation, which are themselves in turn automatic in action. We find that repression (which, though it served a useful purpose to begin with, leads ultimately to a damaging loss of inhibition and mental control) affects memories so much more easily than perceptions because the former can receive no extra cathexis from the excitation of the psychical sense-organs. It is true on the one hand that a thought which has to be warded off cannot become conscious, because it has undergone repression; but on the other hand it sometimes happens that a thought of this kind is only repressed because for other reasons it has been withdrawn from conscious perception. Here are some hints of which we take advantage in our therapeutic procedure in order to undo repressions which have already been effected.

The value of the hypercathexis which is set up in the mobile quantities by the regulating influence of the sense organ of the *Cs.* cannot be better illustrated in its teleological aspect than by the fact of its creation of a new series of qualities and consequently of a new process of regulation which constitutes the superiority of men over animals. Thought-processes are in themselves without quality, except for the pleasurable and unpleasurable excitations which accompany them, and which, in view of their possible disturbing effect upon thinking, must be kept within bounds. In order that thought-processes may acquire quality, they are associated in human beings with verbal memories, whose residues of quality are sufficient to draw the attention of consciousness to them and to endow the process of thinking with a new mobile cathexis from consciousness.

The whole multiplicity of the problems of consciousness can only be grasped by an analysis of the thought-processes in hysteria. These give one the impression that the transition from a preconscious to a conscious cathexis is marked by a censorship similar to that between the *Ucs.* and the *Pcs.* This censorship, too, only comes into force above a certain quantitative limit, so that thought-structures of low intensity escape it. Examples of every possible variety of how a thought can be withheld from consciousness or can force its way into consciousness under certain limitations are to be found included within the framework of psychoneurotic phenomena; and they all point to the intimate and reciprocal relations between censorship and consciousness. I will bring these psychological reflections to an end with a report of two such examples.

I was called in to a consultation last year to examine an intelligent and unembarrassed-looking girl. She was most surprisingly dressed. For though as a rule a woman's clothes are carefully considered down to the last detail, she was wearing one of her stockings hanging down and two of the buttons on her blouse were undone. She complained of having pains in her leg and, without being asked, exposed her calf. But what she principally complained of was, to use her own words, that she had a feeling in her body as though there was something 'stuck into it' which was 'moving backwards and forwards' and was 'shaking' her through and through: sometimes it made her whole body feel 'stiff.' My medical colleague, who was present at the examination, looked at me; he found no difficulty in understanding the meaning of her complaint. But what struck both of us as extraordinary was the fact that it meant nothing to the patient's mother - though she must often have found herself in the situation which her child was describing. The girl herself had no notion of the bearing of her remarks; for if she had, she would never have given voice to them. In this case it had been possible to hoodwink the censorship into allowing a phantasy which would normally have been kept in the preconscious to emerge into consciousness under the innocent disguise of making a complaint.

Here is another example. A fourteen-year-old boy came to me for psycho-analytic treatment suffering from *tic convulsif*, hysterical vomiting, headaches, etc. I began the treatment by assuring him that if he shut his eyes he would see pictures or have ideas, which he was then to communicate to me. He replied in pictures. His last impression before coming to me was revived visually in his memory. He had been playing at draughts with his uncle and saw the board in front of him. He thought of various positions, favourable or unfavourable, and of moves that one must not make. He then saw a dagger lying on the board - an object that belonged to his father but which his imagination placed on the board. Then there was a sickle lying on the board and next a scythe. And there now appeared a picture of an old peasant mowing the grass in front of the patient's distant home with a scythe. After a few days I discovered the meaning of this series of pictures. The boy had been upset by an unhappy family situation. He had a father who was a hard man, liable to fits of rage, who had been unhappily married to the patient's mother, and whose educational methods had consisted of threats. His father had been divorced from his mother, a tender and affectionate woman, had married again and had one day brought a young woman home with him who was to be the boy's new mother. It was during the first few days after this that the fourteen-year-old boy's illness had come on. His suppressed rage against his father was what had constructed this series of pictures with their understandable allusions. The material for them was provided by a recollection from mythology. The sickle was the one with which Zeus castrated his father; the scythe and the picture of the old peasant represented Kronos, the violent old man who devoured his children and on whom Zeus took such unfilial vengeance. His father's marriage gave the boy an opportunity of repaying the reproaches and threats which he had heard from his father long before because he had played with his genitals. (Cf. the playing at draughts; the forbidden moves; the dagger which could be used to kill.) In this case long-repressed memories and derivatives from them which had remained unconscious slipped into consciousness by a roundabout path in the form of *apparently meaningless* pictures.

Thus I would look for the *theoretical* value of the study of dreams in the contributions it makes to psychological knowledge and in the preliminary light it throws on the problems of the psychoneuroses. Who can guess the importance of the results which might be obtained from a thorough understanding of the structure and functions of the mental apparatus, since even the present state of our knowledge allows us to exert a favourable therapeutic influence on the curable forms of psychoneurosis? But what of the *practical* value of this study - I hear the question raised - as a means towards an understanding of the mind, towards a revelation of the hidden characteristics of individual men? Have not the unconscious impulses brought out by dreams the importance of real forces in mental life? Is the ethical significance of suppressed wishes to be made light of - wishes which, just as they lead to dreams, may some day lead to other things?

I do not feel justified in answering these questions. I have not considered this side of the problem of dreams further. I think however, that the Roman emperor was in the wrong when he had one of his subjects executed because he had dreamt of murdering the emperor. He should have begun by trying to find out what the dream meant; most probably its meaning was not what it appeared to be. And even if a dream with another content had had this act of *lèse majesté* as its meaning, would it not be right to bear in mind Plato's dictum that the virtuous man is content to *dream* what a wicked man really *does*? I think it is best, therefore, to acquit dreams. Whether we are to attribute *reality* to unconscious wishes, I cannot say. It must be denied, of course, to any transitional or intermediate thoughts. If we look at unconscious wishes reduced to their most fundamental and truest shape, we shall have to conclude, no doubt, that *psychical* reality is a particular form of existence not to be confused with *material* reality. Thus there seems to be no justification for people's reluctance in accepting responsibility for the immorality of their dreams. When the mode of functioning of the mental apparatus is rightly appreciated and the relation between the conscious and the unconscious understood, the greater part of what is ethically objectionable in our dream and phantasy lives will be found to disappear. In the words of Hanns Sachs: 'If we look in our consciousness at something that has been told up by a dream about a contemporary (real) situation, we ought not to be surprised to find that the monster which we saw under the magnifying glass of analysis turns out to be a tiny infusorian.'

Actions and consciously expressed opinions are as a rule enough for practical purposes in judging men's characters. Actions deserve to be considered first and foremost; for many impulses which force their way through to consciousness are then brought to nothing by the real forces of mental life before they can mature into deeds. In fact, such impulses often meet with no psychical obstacles to their progress, for the very reason that the unconscious is certain that they will be stopped at some other stage. It is in any case instructive to get to know the much trampled soil from which our virtues proudly spring. Very rarely does the complexity of a human character, driven hither and thither by dynamic forces, submit to a choice between simple alternatives, as our antiquated morality would have us believe.

And the value of dreams for giving us knowledge of the future? There is of course no question of that. It would be truer to say instead that they give us knowledge of the past. For dreams are derived from the past in every sense. Nevertheless the ancient belief that dreams foretell the future is not wholly devoid of truth. By picturing our wishes as fulfilled, dreams are after all leading us into the future. But this future, which the dreamer pictures as the present, has been moulded by his indestructible wish into a perfect likeness of the past.

APPENDIX A

A PREMONITORY DREAM FULFILLED

Frau B., an estimable woman who moreover possesses a critical sense, told me in another connection and without the slightest *arrière pensée* that once some years ago she dreamt she had met Dr. K., a friend and former family doctor of hers, in the Kärntnerstrasse in front of Hiess's shop. The next morning, while she was walking along the same street, she in fact met the person in question at the very spot she had dreamt of. So much for my theme. I will only add that no subsequent event proved the importance of this miraculous coincidence, which cannot therefore be accounted for by what lay in the future.

Analysis of the dream was helped by questioning, which established the fact that there was no evidence of her having had any recollection at all of the dream on the morning after she dreamt it, until after her walk - evidence such as her having written the dream down or told it to someone before it was fulfilled. On the contrary, she was obliged to accept the following account of what happened, which seems to me more plausible, without raising any objection to it. She was walking along the Kärntnerstrasse one morning and met her old family doctor in front of Hiess's shop. On seeing him she felt convinced that she had dreamt the night before of having this very meeting at that precise spot. According to the rules that apply to the interpretation of neurotic symptoms, her conviction must have been justified; its content may, however, require to be re-interpreted.

The following is an episode with which Dr. K. is connected from Frau B.'s earlier life. When she was young she was married, without her wholehearted consent, to an elderly but wealthy man. A few years later he lost his money, fell ill of tuberculosis and died. For many years the young woman supported herself and her sick husband by giving music lessons. Among her friends in misfortune was her family doctor, Dr. K., who devoted himself to looking after her husband and helped her in finding her first pupils. Another friend was a barrister, also a Dr. K., who put the chaotic affairs of the ruined merchant in order, while at the same time he made love to the young woman and - for the first and last time - set her passion aflame. This love affair brought her no real happiness, for the scruples created by her upbringing and her cast of mind interfered with her complete surrender while she was married and later when she was a widow. In the same connection in which she told me the dream, she also told me of a real occurrence dating from this unhappy period of her life, an occurrence which in her opinion was a remarkable coincidence. She was in her room, kneeling on the floor with her head buried in a chair and sobbing in passionate longing for her friend and helper the barrister, when at that very moment the door opened and in he came to visit her. We shall find nothing at all remarkable in this coincidence when we consider how often she thought of him and how often he probably visited her. Moreover, accidents which seem preconcerted like this are to be found in every love story. Nevertheless this coincidence was probably the true content of her dream and the sole basis of her conviction that it had come true.

Between the scene in which her wish had been fulfilled and the time of the dream more than twenty-five years elapsed. In the meantime Frau B. had become the widow of a second husband who left her with a child and a fortune. The old lady's affection was still centred on Dr. K., who was now her adviser and the administrator of her estate and whom she saw frequently. Let us suppose that during the few days before the dream she had been expecting a visit from him, but that this had not taken place - he was no longer so pressing as he used to be. She may then have quite well had a nostalgic dream one night which took her back to the old days. Her dream was probably of a *rendez-vous* at the time of her love affair, and the chain of her dream-thoughts carried her back to the occasion when, without any pre-arrangement, he had come in at the very moment at which she had been longing for him. She probably had dreams of this kind quite often now; they were a part of the belated punishment with which a woman pays for her youthful cruelty. But such dreams - derivatives of a suppressed current of thought, filled with memories of *rendez-vous* of which, since her second marriage, she no longer liked to think - such dreams were put aside on waking. And that was what happened to our ostensibly prophetic dream. She then went out, and in the Kärntnerstrasse, at a spot which was in itself indifferent, she met her old family doctor, Dr. K. It was a very long time since she had seen him. He was intimately associated with the excitements of that happy-unhappy time. He too had been a helper, and we may suppose that he had been used in her thoughts, and perhaps in her dreams as well, as a screen figure behind which she concealed the better-loved figure of the other Dr. K. This meeting now revived her recollection of the dream. She must have thought: 'Yes, I had a dream last night of my *rendez-vous* with Dr. K.' But this recollection had to undergo the distortion which the dream escaped only because it had been completely forgotten. She inserted the indifferent K. (who had reminded her of the dream) in place of the beloved K. The content of the dream - the *rendez-vous* - was transferred to a belief that she had dreamt of that particular spot, for a *rendez-vous* consists in two people coming to the same spot at the same time. And if she then had an impression that a dream had been fulfilled, she was only giving effect in that way to her memory of the scene in which she had longed in her misery for him to come and her longing had at once been fulfilled.

Thus the creation of a dream after the event, which alone makes prophetic dreams possible, is nothing other than a form of censoring, thanks to which the dream is able to make its way through into consciousness.

ON DREAMS

ON DREAMS

I

During the epoch which may be described as pre-scientific, men had no difficulty in finding an explanation of dreams. When they remembered a dream after waking up, they regarded it as either a favourable or a hostile manifestation by higher powers, daemonic and divine. When modes of thought belonging to natural science began to flourish, all this ingenious mythology was transformed into psychology, and to-day only a small minority of educated people doubt that dreams are a product of the dreamer's own mind.

Since the rejection of the mythological hypothesis, however, dreams have stood in need of explanation. The conditions of their origin, their relation to waking mental life, their dependence upon stimuli which force their way upon perception during the state of sleep, the many peculiarities of their content which are repugnant to waking thought, the inconsistency between their ideational images and the affects attaching to them, and lastly their transitory character, the manner in which waking thought pushes them on one side as something alien to it, and mutilates or extinguishes them in memory - all of these and other problems besides have been awaiting clarification for many hundreds of years, and till now no satisfactory solution of them has been advanced. But what stands in the foreground of our interest is the question of the *significance* of dreams, a question which bears a double sense. It enquires in the first place as to the psychological significance of dreaming, as to the relation of dreams to other mental processes, and as to any biological function that they may have; in the second place it seeks to discover whether dreams can be interpreted, whether the content of individual dreams has a 'meaning', such as we are accustomed to find in other psychological structures.

In the assessment of the significance of dreams three lines of thought can be distinguished. One of these, which echoes, as it were, the ancient overvaluation of dreams, is expressed in the writings of certain philosophers. They consider that the basis of dream-life is a peculiar state of mental activity, and even go so far as to acclaim that state as an elevation to a higher level. For instance, Schubert declares that dreams are a liberation of the spirit from the power of external nature, and a freeing of the soul from the bonds of the senses. Other thinkers, without going so far as this, insist nevertheless that dreams arise essentially from mental impulses and represent manifestations of mental forces which have been prevented from expanding freely during the daytime. (Cf. the 'dream imagination' of Scherner and Volkelt.) A large number of observers agree in attributing to dream-life a capacity for superior functioning in certain departments at least (e.g. in memory).

In sharp contrast to this, the majority of medical writers adopt a view according to which dreams scarcely reach the level of being psychical phenomena at all. On their theory, the sole instigators of dreams are the sensory and somatic stimuli which either impinge upon the sleeper from outside or become active accidentally in his internal organs. What is dreamt, they contend, has no more claim to sense and meaning than, for instance, the sounds which would be produced if 'the ten fingers of a man who knows nothing of music were wandering over the keys of a piano.' Dreams are described by Binz as being no more than 'somatic processes which are in every case useless and in many cases positively pathological.' All the characteristics of dream-life would thus be explained as being due to the disconnected activity of separate organs or groups of cells in an otherwise sleeping brain, an activity forced upon them by physiological stimuli.

Popular opinion is but little affected by this scientific judgement, and is not concerned as to the sources of dreams; it seems to persist in the belief that nevertheless dreams have a meaning, which relates to the prediction of the future and which can be discovered by some process of interpretation of a content which is often confused and puzzling. The methods of interpretation employed consist in transforming the content of the dream as it is remembered, either by replacing it piecemeal in accordance with a fixed key, or by replacing the dream as a whole by another whole to which it stands in a symbolic relation. Serious-minded people smile at these efforts: '*Träume sind Schäume*' - 'dreams are froth'.

II

One day I discovered to my great astonishment that the view of dreams which came nearest to the truth was not the medical but the popular one, half-involved though it still was in superstition. For I had been led to fresh conclusions on the subject of dreams by applying to them a new method of psychological investigation which had done excellent service in the solution of phobias, obsessions and delusions, etc. Since then, under the name of 'psycho-analysis', it has found acceptance by a whole school of research workers. The numerous analogies that exist between dream-life and a great variety of conditions of psychical illness in waking life have indeed been correctly observed by many medical investigators. There seemed, therefore, good ground for hoping that a method of investigation which had given satisfactory results in the case of psychopathic structures would also be of use in throwing light upon dreams. Phobias and obsessions are as alien to normal consciousness as dreams are to waking consciousness; their origin is as unknown to consciousness as that of dreams. In the case of these psychopathic structures practical considerations led to an investigation of their origin and mode of development; for experience had shown that the discovery of the trains of thought which, concealed from consciousness, connect the pathological ideas with the remaining contents of the mind is equivalent to a resolution of the symptoms and has as its consequence the mastering of ideas which till then could not be inhibited. Thus psychotherapy was the starting-point of the procedure of which I made use for the explanation of dreams.

This procedure is easily described, although instruction and practice would be necessary before it could be put into effect.

If we make use of it on someone else, let us say on a patient with a phobia, we require him to direct his attention on to the idea in question, not, however, to reflect upon it as he has done so often already, but to take notice of *whatever occurs to his mind without any exception* and report it to the physician. If he should then assert that his attention is unable to grasp anything at all, we dismiss this with an energetic assurance that a complete absence of any ideational subject-matter is quite impossible. And in fact very soon numerous ideas will occur to him and will lead on to others; but they will invariably be prefaced by a judgement on the part of the self-observer to the effect that they are senseless or unimportant, that they are irrelevant, and that they occurred to him by chance and without any connection with the topic under consideration. We perceive at once that it was this critical attitude which prevented the subject from reporting any of these ideas, and which indeed had previously prevented them from becoming conscious. If we can induce him to abandon his criticism of the ideas that occur to him, and to continue pursuing the trains of thought which will emerge so long as he keeps his attention turned upon them, we find ourselves in possession of a quantity of psychical material, which we soon find is clearly connected with the pathological idea which was our starting-point; this material will soon reveal connections between the pathological idea and other ideas, and will eventually enable us to replace the pathological idea by a new one which fits into the nexus of thought in an intelligible fashion.

This is not the place in which to give a detailed account of the premises upon which this experiment was based, or the consequences which follow from its invariable success. It will therefore be enough to say that we obtain material that enables us to resolve any pathological idea if we turn our attention precisely to those associations which are 'involuntary', which 'interfere with our reflection', and which are normally dismissed by our critical faculty as worthless rubbish.

If we make use of this procedure upon *ourselves*, we can best assist the investigation by at once writing down what are at first unintelligible associations.

I will now show what results follow if I apply this method of investigation to dreams. Any example of a dream should in fact be equally appropriate for the purpose; but for particular reasons I will choose some dream of my own, one which seems obscure and meaningless as I remember it, and one which has the advantage of brevity. A dream which I actually had last night will perhaps meet these requirements. Its content, as I noted it down immediately after waking up, was as follows:

Company at table or table d'hôte . . . spinach was being eaten . . . Frau E. L. was sitting beside me; she was turning her whole attention to me and laid her hand on my knee in an intimate manner. I removed her hand unresponsively. She then said: "But you've always had such beautiful eyes." . . . I then had an indistinct picture of two eyes, as though it were a drawing or like the outline of a pair of spectacles . . .'

This was the whole of the dream, or at least all that I could remember of it. It seemed to me obscure and meaningless, but above all surprising. Frau E. L. is a person with whom I have hardly at any time been on friendly terms, nor, so far as I know, have I ever wished to have any closer relations with her. I have not seen her for a long time, and her name has not, I believe, been mentioned during the last few days. The dream-process was not accompanied by affects of any kind.

Reflecting over this dream brought me no nearer to understanding it. I determined, however, to set down without any premeditation or criticism the associations which presented themselves to my self-observation. As I have found, it is advisable for this purpose to divide a dream into its elements and to find the associations attaching to each of these fragments separately.

Company at table or table d'hôte. This at once reminded me of an episode which occurred late yesterday evening. I came away from a small party in the company of a friend who offered to take a cab and drive me home in it. 'I prefer taking a cab with a taximeter', he said, 'it occupies one's mind so agreeably; one always has something to look at.' When we had taken our places in the cab and the driver had set the dial, so that the first charge of sixty hellers became visible, I carried the joke further. 'We've only just got in', I said, 'and already we owe him sixty hellers. A cab with a taximeter always reminds me of a table d'hôte. It makes me avaricious and selfish, because it keeps on reminding me of what I owe. My debt seems to be growing too fast, and I'm afraid of getting the worst of the bargain; and in just the same way at a table d'hôte I can't avoid feeling in a comic way that I'm getting too little, and must keep an eye on my own interests.' I went on to quote, somewhat discursively:

'Ihr führt ins Leben uns hinein,
Ihr lasst den Armen schuldig werden.'¹

¹ [These lines are from one of the Harp-player's songs in Goethe's *Wilhelm Meister*. In the original the words are addressed to the Heavenly Powers and may be translated literally: 'You lead us into life, you make the poor creature guilty.' But the words '*Armen*' and '*schuldig*' are both capable of bearing another meaning. '*Armen*' might mean 'poor' in the financial sense and '*schuldig*' might mean 'in debt.' So in the present context the last line could be rendered: 'You make the poor man fall into debt.']

And now a second association to 'table d'hôte.' A few weeks ago, while we were at table in a hotel at a mountain resort in the Tyrol, I was very much annoyed because I thought my wife was not being sufficiently reserved towards some people sitting near us whose acquaintance I had no desire at all to make. I asked her to concern herself more with me than with these strangers. This was again *as though I were getting the worst of the bargain at the table*. I was struck too by the contrast between my wife's behaviour at table and that of Frau E. L. in the dream, who 'turned her whole attention to me.'

To proceed. I now saw that the events in the dream were a reproduction of a small episode of a precisely similar kind which occurred between my wife and me at the time at which I was secretly courting her. The caress which she gave me under the table-cloth was her reply to a pressing love letter. In the dream, however, my wife was replaced by a comparative stranger - E. L.

Frau E. L. is the daughter of a man to whom I was once *in debt*. I could not help noticing that this revealed an unsuspected connection between parts of the content of the dream and my associations. If one follows the train of association starting out from one element of a dream's content, one is soon brought back to another of its elements. My associations to the dream were bringing to light connections which were not visible in the dream itself.

If a person expects one to keep an eye on his interests without any advantage to oneself, his artlessness is apt to provoke the scornful question: 'Do you suppose I'm going to do this or that for the sake of your *beaux yeux* [*beautiful eyes*]?' That being so, Frau E. L.'s speech in the dream, 'You've always had such beautiful eyes', can only have meant: 'People have always done everything for you for love; you have always had everything *without paying for it*.' The truth is, of course, just the contrary: I have always paid dearly for whatever advantage I have had from other people. The fact that my friend took me home yesterday in a cab *without my paying for it* must, after all, have made an impression on me.

Incidentally, the friend whose guests we were yesterday has often put me in his debt. Only recently I allowed an opportunity of repaying him to slip by. He has had only one present from me - an antique bowl, round which there are *eyes* painted: what is known as an '*occhiale*', to avert the *evil eye*. Moreover he is an *eye surgeon*. The same evening I asked him after a woman patient, whom I had sent on to him for a consultation to fit her with *spectacles*.

As I now perceived, almost all the elements of the dream's content had been brought into the new context. For the sake of consistency, however, the further question might be asked of why *spinach*, of all things, was being served in the dream. The answer was that *spinach* reminded me of an episode which occurred not long ago at our family table, when one of the children - and precisely the one who really deserves to be admired for his *beautiful eyes* - refused to eat any spinach. I myself behaved in just the same way when I was a child; for a long time I detested spinach, till eventually my taste changed and promoted that vegetable into one of my favourite foods. My own early life and my child's were thus brought together by the mention of this dish. 'You ought to be glad to have spinach', the little *gourmet's* mother exclaimed; 'there are children who would be only too pleased to have spinach.' Thus I was reminded of the duties of parents to their children. Goethe's words

'Ihr führt ins Leben uns hinein,
Ihr lasst den Armen schuldig werden.'

gained a fresh meaning in this connection.

I will pause here to survey the results I had so far reached in my dream-analysis. By following the associations which arose from the separate elements of the dream divorced from their context, I arrived at a number of thoughts and recollections, which I could not fail to recognize as important products of my mental life. This material revealed by the analysis of the dream was intimately connected with the dream's content, yet the connection was of such a kind that I could never have inferred the fresh material from that content. The dream was unemotional, disconnected and unintelligible; but while I was producing the thoughts behind the dream, I was aware of intense and well-founded affective impulses; the thoughts themselves fell at once into logical chains, in which certain central ideas made their appearance more than once. Thus, the contrast between 'selfish' and 'unselfish', and the elements 'being in debt' and 'without paying for it' were central ideas of this kind, not represented in the dream itself. I might draw closer together the threads in the material revealed by the analysis, and I might then show that they converge upon a single nodal point, but considerations of a personal and not of a scientific nature prevent my doing so in public. I should be obliged to betray many things which had better remain my secret, for on my way to discovering the solution of the dream all kinds of things were revealed which I was unwilling to admit even to myself. Why then, it will be asked, have I not chosen some other dream, whose analysis is better suited for reporting, so that I could produce more convincing evidence of the meaning and connectedness of the material uncovered by analysis? The answer is that *every* dream with which I might try to deal would lead to things equally hard to report and would impose an equal discretion upon me. Nor should I avoid this difficulty by bringing up someone else's dream for analysis, unless circumstances enabled me to drop all disguise without damage to the person who had confided in me.

At the point which I have now reached, I am led to regard the dream as a sort of *substitute* for the thought-processes, full of meaning and emotion, at which I arrived after the completion of the analysis. We do not yet know the nature of the process which has caused the dream to be generated from these thoughts, but we can see that it is wrong to regard it as purely physical and without psychical meaning, as a process which has arisen from the isolated activity of separate groups of brain cells aroused from sleep.

Two other things are already clear. The content of the dream is very much shorter than the thoughts for which I regard it as a substitute; and analysis has revealed that the instigator of the dream was an unimportant event of the evening before I dreamt it.

I should, of course, not draw such far-reaching conclusions if only a single dream-analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from *any* dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream re-appear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the '*manifest* content of the dream' and the latter - without, in the first instance, making any further distinction - as the '*latent* content of the dream.' I am now faced by two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work.' The counterpart to this activity - one which brings about a transformation in the opposite direction - is already known to us as the work of analysis. The remaining problems arising out of dreams - questions as to the instigators of dreams, as to the origin of their material, as to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten - all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream-content. Since I attribute all the contradictory and incorrect views upon dream-life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the *manifest dream* with the *latent dream-thoughts*.

III

The transformation of the latent dream-thoughts into the manifest dream-content deserves all our attention, since it is the first instance known to us of psychical material being changed over from one mode of expression to another, from a mode of expression which is immediately intelligible to us to another which we can only come to understand with the help of guidance and effort, though it too must be recognized as a function of our mental activity.

Dreams can be divided into three categories in respect of the relation between their latent and manifest content. In the first place, we may distinguish those dreams which *make sense* and are at the same time *intelligible*, which, that is to say, can be inserted without further difficulty into the context of our mental life. We have numbers of such dreams. They are for the most part short and appear to us in general to deserve little attention, since there is nothing astonishing or strange about them. Incidentally, their occurrence constitutes a powerful argument against the theory according to which dreams originate from the isolated activity of separate groups of brain cells. They give no indication of reduced or fragmentary psychical activity, but nevertheless we never question the fact of their being dreams, and do not confuse them with the products of waking life. A second group is formed by those dreams which, though they are connected in themselves and have a clear sense, nevertheless have a *bewildering* effect, because we cannot see how to fit that sense into our mental life. Such would be the case if we were to dream, for instance, that a relative of whom we were fond had died of the plague, when we had no reason for expecting, fearing or assuming any such thing; we should ask in astonishment: 'How did I get hold of such an idea?' The third group, finally, contains those dreams which are without either sense or intelligibility, which seem *disconnected*, *confused*, and *meaningless*. The preponderant majority of the products of our dreaming exhibit these characteristics, which are the basis of the low opinion in which dreams are held and of the medical theory that they are the outcome of a restricted mental activity. The most evident signs of incoherence are seldom absent, especially in dream-compositions of any considerable length and complexity.

The contrast between the manifest and latent content of dreams is clearly of significance only for dreams of the second and more particularly of the third category. It is there that we are faced by riddles which only disappear after we have replaced the manifest dream by the latent thoughts behind it; and it was on a specimen of the last category - a confused and unintelligible dream - that the analysis which I have just recorded was carried out. Contrary to our expectation, however, we came up against motives which prevented us from becoming fully acquainted with the latent dream-thoughts. A repetition of similar experiences may lead us to suspect that *there is an intimate and regular relation between the unintelligible and confused nature of dreams and the difficulty of reporting the thoughts behind them*. Before enquiring into the nature of this relation, we may with advantage turn our attention to the more easily intelligible dreams of the first category, in which the manifest and latent content coincide, and there appears to be a consequent saving in dream-work.

Moreover, an examination of these dreams offers advantages from another standpoint. For *children's* dreams are of that kind - significant and not puzzling. Here, incidentally, we have a further argument against tracing the origin of dreams to dissociated cerebral activity during sleep. For why should a reduction in psychical functioning of this kind be a characteristic of the state of sleep in the case of adults but not in that of children? On the other hand, we shall be fully justified in expecting that an explanation of psychical processes in children, in whom they may well be greatly simplified, may turn out to be an indispensable prelude to the investigation of the psychology of adults.

I will therefore record a few instances of dreams which I have collected from children. A little girl nineteen months old had been kept without food all day because she had had an attack of vomiting in the morning; her nurse declared that she had been upset by eating strawberries. During the night after this day of starvation she was heard saying her own name in her sleep and adding: '*Stwawbewwies, wild stwawbewwies, omblet, pudden!*' She was thus dreaming of eating a meal, and she laid special stress in her menu on the particular delicacy of which, as she had reason to expect, she would only be allowed scanty quantities in the near future. - A little boy of twenty-two months had a similar dream of a feast which he had been denied. The day before, he had been obliged to present his uncle with a gift of a basket of fresh cherries, of which he himself, of course, had only been allowed to taste a single sample. He awoke with this cheerful news: '*Hermann eaten all the chewwies!*' - One day a girl of three and a quarter made a trip across a lake. The voyage was evidently not long enough for her, for she cried when she had to get off the boat. Next morning she reported that during the night she had been for a trip on the lake: she had been continuing her interrupted voyage. - A boy of five and a quarter showed signs of dissatisfaction in the course of a walk in the neighbourhood of the Dachstein. Each time a new mountain came into view he asked if it was the Dachstein and finally refused to visit a waterfall with the rest of the company. His behaviour was attributed to fatigue; but it found a better explanation when next morning he reported that he had dreamt that *he climbed up the Dachstein*. He had evidently had the idea that the expedition would end in a climb up the Dachstein, and had become depressed when the promised mountain never came in view. He made up in his dream for what the previous day had failed to give him. - A six-year-old girl had an exactly similar dream. In the course of a walk her father had stopped short of their intended goal as the hour was getting late. On their way back she had noticed a signpost bearing the name of another landmark; and her father had promised to take her there as well another time. Next morning she met her father with the news that she had dreamt that *he had been with her to both places*.

The common element in all these children's dreams is obvious. All of them fulfilled wishes which were active during the day but had remained unfulfilled. The dreams were simple and undisguised *wish-fulfilments*.

Here is another child's dream, which, though at first sight it is not quite easy to understand, is also nothing more than a wish-fulfilment. A little girl not quite four years old had been brought to town from the country because she was suffering from an attack of poliomyelitis. She spent the night with an aunt who had no children, and was put to sleep in a large bed - much too large for her, of course. Next morning she said she had had a dream that *the bed had been far too small for her, and that there has been no room for her in it*. It is easy to recognize this dream as a wishful dream if we remember that children very often express a wish '*to be big*.' The size of the bed was a disagreeable reminder of her smallness to the would-be big child; she therefore corrected the unwelcome relation in her dream, and grew so big that even the large bed was too small for her.

Even when the content of children's dreams becomes complicated and subtle, there is never any difficulty in recognizing them as wish-fulfillments. An eight-year-old boy had a dream that he was driving in a chariot with Achilles and that Diomedes was the charioteer. It was shown that the day before he had been deep in a book of legends about the Greek heroes; and it was easy to see that he had taken the heroes as his models and was sorry not to be living in their days.

This small collection throws a direct light on a further characteristic of children's dreams: their connection with daytime life. The wishes which are fulfilled in them are carried over from daytime and as a rule from the day before, and in waking life they have been accompanied by intense emotion. Nothing unimportant or indifferent, or nothing which would strike a child as such, finds its way into the content of their dreams.

Numerous examples of dreams of this infantile type can be found occurring in adults as well, though, as I have said, they are usually brief in content. Thus a number of people regularly respond to a stimulus of thirst during the night with dreams of drinking, which thus endeavour to get rid of the stimulus and enable sleep to continue. In some people 'dreams of convenience' of this kind often occur before waking, when the necessity for getting up presents itself. They dream that they are already up and at the washing-stand, or that they are already at the school or office where they are due at some particular time. During the night before a journey we not infrequently dream of having arrived at our destination; so too, before a visit to the theatre or a party, a dream will often anticipate the pleasure that lies ahead - out of impatience, as it were. In other dreams the wish-fulfilment is expressed a stage more indirectly: some connection or implication must be established - that is, the work of interpretation must be begun - before the wish-fulfilment can be recognized. A man told me, for instance, that his young wife had had a dream that her period had started. I reflected that if this young woman had missed her period she must have known that she was faced with a pregnancy. Thus when she reported her dream she was announcing her pregnancy, and the meaning of the dream was to represent as fulfilled her wish that the pregnancy might be postponed for a while. Under unusual or extreme conditions dreams of this infantile character are particularly common. Thus the leader of a polar expedition has recorded that the members of his expedition, while they were wintering in the ice-field and living on a monotonous diet and short rations, regularly dreamt like children of large meals, of mountains of tobacco, and of being back at home.

It by no means rarely happens that in the course of a comparatively long, complicated and on the whole confused dream one particularly clear portion stands out, which contains an unmistakable wish-fulfilment, but which is bound up with some other, unintelligible material. But in the case of adults, anyone with some experience in analysing their dreams will find to his surprise that even those dreams which have an appearance of being transparently clear are seldom as simple as those of children, and that behind the obvious wish-fulfilment some other meaning may lie concealed.

It would indeed be a simple and satisfactory solution of the riddle of dreams if the work of analysis were to enable us to trace even the meaningless and confused dreams of adults back to the infantile type of fulfilment of an intensely felt wish of the previous day. There can be no doubt, however, that appearances do not speak in favour of such an expectation. Dreams are usually full of the most indifferent and strangest material, and there is no sign in their content of the fulfilment of any wish.

But before taking leave of infantile dreams with their undisguised wish-fulfilments, I must not omit to mention one principal feature of dreams, which has long been evident and which emerges particularly clearly precisely in this group. Every one of these dreams can be replaced by an optative clause: 'Oh, if only the trip on the lake had lasted longer!' - 'If only I were already washed and dressed!' - 'If only I could have kept the cherries instead of giving them to Uncle!' But dreams give us more than such optative clauses. They show us the wish as already fulfilled; they represent its fulfilment as real and present; and the material employed in dream-representation consists principally, though not exclusively, of situations and of sensory images, mostly of a visual character. Thus, even in this infantile group, a species of transformation, which deserves to be described as dream-work, is not completely absent: *a thought expressed in the optative has been replaced by a representation in the present tense.*

IV

We shall be inclined to suppose that a transformation of some such kind has occurred even in confused dreams, though we cannot tell whether what has been transformed was an optative in their case too. There are, however, two passages in the specimen dream which I have reported, and with whose analysis we have made some headway, that give us reason to suspect something of the kind. The analysis showed that my wife had concerned herself with some other people at table, and that I had found this disagreeable; the dream contained precisely the opposite of this - the person who took the place of my wife was turning her whole attention to me. But a disagreeable experience can give rise to no more suitable wish than that its opposite might have occurred - which was what the dream represented as fulfilled. There was an exactly similar relation between the bitter thought revealed in the analysis that I had never had anything free of cost and the remark made by the woman in the dream - 'You've always had such beautiful eyes.' Some part of the opposition between the manifest and latent content of dreams is thus attributable to wish-fulfilment.

But another achievement of the dream-work, tending as it does to produce incoherent dreams, is even more striking. If in any particular instance we compare the number of ideational elements or the space taken up in writing them down in the case of the dream and of the dream-thoughts to which the analysis leads us and of which traces are to be found in the dream itself, we shall be left in no doubt that the dream-work has carried out a work of compression or *condensation* on a large scale. It is impossible at first to form any judgement of the degree of this condensation; but the deeper we plunge into a dream-analysis the more impressive it seems. From every element in a dream's content associative threads branch out in two or more directions; every situation in a dream seems to be put together out of two or more impressions or experiences. For instance, I once had a dream of a sort of swimming-pool, in which the bathers were scattering in all directions; at one point on the edge of the pool someone was standing and bending towards one of the people bathing, as though to help her out of the water. The situation was put together from a memory of an experience I had had at puberty and from two paintings, one of which I had seen shortly before the dream. One was a picture from Schwind's series illustrating the legend of Mélusine, which showed the water-nymphs surprised in their pool (cf. the scattering bathers in the dream); the other was a picture of the Deluge by an Italian Master; while the little experience remembered from my puberty was of having seen the instructor at a swimming-school helping a lady out of the water who had stopped in until after the time set aside for men bathers. -In the case of the example which I chose for interpretation, an analysis of the situation led me to a small series of recollections each of which contributed something to the content of the dream. In the first place, there was the episode from the time of my engagement of which I have already spoken. The pressure upon my hand under the table, which was a part of that episode, provided the dream with the detail 'under the table' - a detail which I had to add as an afterthought to my memory of the dream. In the episode itself there was of course no question of 'turning to me'; the analysis showed that this element was the fulfilment of a wish by presenting the opposite of an actual event, and that it related to my wife's behaviour at the table d'hôte. But behind this recent recollection there lay concealed an exactly similar and far more important scene from the time of our engagement, which estranged us for a whole day. The intimate laying of a hand on my knee belonged to a quite different context and was concerned with quite other people. This element in the dream was in turn the starting-point of two separate sets of memories - and so on.

The material in the dream-thoughts which is packed together for the purpose of constructing a dream-situation must of course in itself be adaptable for that purpose. There must be one or more *common elements* in all the components. The dream-work then proceeds just as Francis Galton did in constructing his family photographs. It superimposes, as it were, the different components upon one another. The common element in them then stands out clearly in the composite picture, while contradictory details more or less wipe one another out. This method of production also explains to some extent the varying degrees of characteristic vagueness shown by so many elements in the content of dreams. Basing itself on this discovery, dream-interpretation has laid down the following rule: In analysing a dream, if an uncertainty can be resolved into an 'either-or', we must replace it for purposes of interpretation by an 'and', and take each of the apparent alternatives as an independent starting-point for a series of associations.

If a common element of this kind between the dream-thoughts is not present, the dream-work sets about *creating* one, so that it may be possible for the thoughts to be given a common representation in the dream. The most convenient way of bringing together two dream-thoughts which, to start with, have nothing in common, is to alter the verbal form of one of them, and thus bring it half-way to meet the other, which may be similarly clothed in a new form of words. A parallel process is involved in hammering out a rhyme, where a similar sound has to be sought for in the same way as a common element is in our present case. A large part of the dream-work consists in the creation of intermediate thoughts of this kind which are often highly ingenious, though they frequently appear far-fetched; these then form a link between the composite picture in the manifest content of the dream and the dream-thoughts, which are themselves diverse both in form and essence and have been determined by the exciting factors of the dream. The analysis of our sample dream affords us an instance of this kind in which a thought has been given a new form in order to bring it into contact with another which is essentially foreign to it. In carrying out the analysis I came upon the following thought: '*I should like to get something sometimes without paying for it*'. But in that form the thought could not be employed in the dream-content. It was therefore given a fresh form: '*I should like to get some enjoyment without cost* ["*Kosten*"].'¹ Now the word '*Kosten*' in its second sense fits into the 'table d'hôte' circle of ideas, and could thus be represented in the '*spinach*' which was served in the dream. When a dish appears at our table and the children refuse it, their mother begins by trying persuasion, and urges them '*just to taste* [*kosten*'] *a bit of it*'. It may seem strange that the dream-work should make such free use of verbal ambiguity, but further experience will teach us that the occurrence is quite a common one.

¹ [The German word '*Kosten*' means both 'cost' and 'to taste.']

The process of condensation further explains certain constituents of the content of dreams which are peculiar to them and are not found in waking ideation. What I have in mind are 'collective' and 'composite figures' and the strange 'composite structures', which are creations not unlike the composite animals invented by the folk-imagination of the Orient. The latter, however, have already assumed stereotyped shapes in our thought, whereas in dreams fresh composite forms are being perpetually constructed in an inexhaustible variety. We are all of us familiar with such structures from our own dreams.

There are many sorts of ways in which figures of this kind can be put together. I may build up a figure by giving it the features of two people; or I may give it the *form* of one person but think of it in the dream as having the *name* of another person; or I may have a visual picture of one person, but put it in a situation which is appropriate to another. In all these cases the combination of different persons into a single representative in the content of the dream has a meaning; it is intended to indicate an 'and' or 'just as', or to compare the original persons with each other in some particular respect, which may even be specified in the dream itself. As a rule, however, this common element between the combined persons can only be discovered by analysis, and is only indicated in the contents of the dream by the formation of the collective figure.

The composite structures which occur in dreams in such immense numbers are put together in an equal variety of ways, and the same rules apply to their resolution. There is no need for me to quote any instances. Their strangeness disappears completely when once we have made up our minds not to class them with the objects of our waking perception, but to remember that they are products of dream-condensation and are emphasizing in an effectively abbreviated form some common characteristic of the objects which they are thus combining. Here again the common element has as a rule to be discovered by analysis. The content of the dream merely says as it were: 'All these things have an element x in common.' The dissection of these composite structures by means of analysis is often the shortest way to finding the meaning of a dream. - Thus, I dreamt on one occasion that I was sitting on a bench with one of my former University teachers, and that the bench, which was surrounded by other benches, was moving forward at a rapid pace. This was a combination of a lecture theatre and a *trottoir roulant*.¹ I will not pursue this train of ideas further. - Another time I was sitting in a railway carriage and holding on my lap an object in the shape of a top-hat [*Zylinderhut*, literally 'cylinder-hat'], which however was made of transparent glass. The situation made me think at once of the proverb: '*Mit dem Hute in der Hand kommt man duchs ganze land*.'² The glass cylinder led me by a short *détour* to think of an incandescent gas-mantle; and I soon saw that I should like to make a discovery which would make me as rich and independent as my fellow-countryman Dr. Auer von Welsbach was made by his, and that I should like to travel instead of stopping in Vienna. In the dream I was travelling with my discovery, the hat in the shape of a glass cylinder - a discovery which, it is true, was not as yet of any great practical use. - The dream-work is particularly fond of representing two *contrary* ideas by the same composite structure. Thus, for instance, a woman had a dream in which she saw herself carrying a tall spray of flowers, such as the angel is represented as holding in pictures of the Annunciation. (This stood for innocence; incidentally, her own name was Maria.) On the other hand, the spray was covered with large white flowers like camellias. (This stood for the opposite of innocence; it was associated with *La dame aux camélias*.)

¹ [The '*trottoir roulant*' was a moving roadway installed at the Paris Exhibition of 1900.]

² ['If you go hat in hand, you can cross the whole land.']

A good proportion of what we have learnt about condensation in dreams may be summarized in this formula: each element in the content of a dream is 'overdetermined' by material in the dream-thoughts; it is not derived from a *single* element in the dream-thoughts, but may be traced back to a whole number. These elements need not necessarily be closely related to each other in the dream-thoughts themselves; they may belong to the most widely separated regions of the fabric of those thoughts. A dream-element is, in the strictest sense of the word, the 'representative' of all this disparate material in the content of the dream. But analysis reveals yet another side of the complicated relation between the content of the dream and the dream-thoughts. Just as connections lead from each element of the dream to several dream-thoughts, so as a rule a single dream-thought is represented by more than one dream-element; the threads of association do not simply converge from the dream-thoughts to the dream-content, they cross and interweave with each other many times over in the course of their journey.

Condensation, together with the transformation of thoughts into situations ('dramatization'), is the most important and peculiar characteristic of the dream-work. So far, however, nothing has transpired as to any *motive* necessitating this compression of the material.

V

In the case of the complicated and confused dreams with which we are now concerned, condensation and dramatization alone are not enough to account for the whole of the impression that we gain of the dissimilarity between the content of the dream and the dream-thoughts. We have evidence of the operation of a third factor, and this evidence deserves careful sifting.

First and foremost, when by means of analysis we have arrived at a knowledge of the dream-thoughts, we observe that the manifest dream-content deals with quite different material from the latent thoughts. This, to be sure, is no more than an appearance, which evaporates under closer examination, for we find ultimately that the whole of the dream-content is derived from the dream-thoughts, and that almost all the dream-thoughts are represented in the dream-content. Nevertheless, something of the distinction still remains. What stands out boldly and clearly in the dream as its essential content must, after analysis, be satisfied with playing an extremely subordinate role among the dream-thoughts; and what, on the evidence of our feelings, can claim to be the most prominent among the dream-thoughts is either not present at all as ideational material in the content of the dream or is only remotely alluded to in some obscure region of it. We may put it in this way: *in the course of the dream-work the psychical intensity passes over from the thoughts and ideas to which it properly belongs on to others which in our judgement have no claim to any such emphasis*. No other process contributes so much to concealing the meaning of a dream and to making the connection between the dream-content and the dream-thoughts unrecognizable. In the course of this process, which I shall describe as 'dream-displacement', the psychical intensity, significance or affective potentiality of the thoughts is, as we further find, transformed into sensory vividness. We assume as a matter of course that the most distinct element in the manifest content of a dream is the most important one; but in fact it is often an *indistinct* element which turns out to be the most direct derivative of the essential dream-thought.

What I have called dream-displacement might equally be described as 'a transvaluation of psychical values.' I shall not have given an exhaustive estimate of this phenomenon, however, unless I add that this work of displacement or transvaluation is performed to a very varying degree in different dreams. There are dreams which come about almost without any displacement. These are the ones which make sense and are intelligible, such, for instance, as those which we have recognized as undisguised wishful dreams. On the other hand, there are dreams in which not a single piece of the dream-thoughts has retained its own psychical value, or in which everything that is essential in the dream-thoughts has been replaced by something trivial. And we can find a complete series of transitional cases between these two extremes. The more obscure and confused a dream appears to be, the greater the share in its construction which may be attributed to the factor of displacement.

Our specimen dream exhibits displacement to this extent at least, that its content seems to have a different *centre* from its dream-thoughts. In the foreground of the dream-content a prominent place is taken by a situation in which a woman seems to be making advances to me; while in the dream-thoughts the chief emphasis is laid on a wish for once to enjoy unselfish love, love which 'costs nothing' - an idea concealed behind the phrase about 'beautiful eyes' and the far-fetched allusion to 'spinach.'

If we undo dream-displacement by means of analysis, we obtain what seems to be completely trustworthy information on two much-disputed problems concerning dreams: as to their instigators and as to their connection with waking life. There are dreams which immediately reveal their derivation from events of the day; there are others in which no trace of any such derivation is to be discovered. If we seek the help of analysis, we find that every dream without any possible exception goes back to an impression of the past few days, or, it is probably more correct to say, of the day immediately preceding the dream, of the 'dream-day.' The impression which plays the part of dream-instigator may be such an important one that we feel no surprise at being concerned with it in the daytime, and in that case we rightly speak of the dream as carrying on with the significant interests of our waking life. As a rule, however, if a connection is to be found in the content of the dream with any impression of the previous day, that impression is so trivial, insignificant and unmemorable, that it is only with difficulty that we ourselves can recall it. And in such cases the content of the dream itself, even if it is connected and intelligible, seems to be concerned with the most indifferent trivialities, which would be unworthy of our interest if we were awake. A good deal of the contempt in which dreams are held is due to the preference thus shown in their content for what is indifferent and trivial.

Analysis does away with the misleading appearance upon which this derogatory judgement is founded. If the content of a dream puts forward some indifferent impression as being its instigator, analysis invariably brings to light a significant experience, and one by which the dreamer has good reason to be stirred. This experience has been replaced by the indifferent one, with which it is connected by copious associative links. Where the content of the dream treats of insignificant and uninteresting ideational material, analysis uncovers the numerous associative paths connecting these trivialities with things that are of the highest psychical importance in the dreamer's estimation. *If what makes their way into the content of dreams are impressions and material which are indifferent and trivial rather than justifiably stirring and interesting, that is only the effect of the process of displacement.* If we answer our questions about dream-instigators and the connection between dreaming and daily affairs on the basis of the new insight we have gained from replacing the manifest by the latent content of dreams, we arrive at these conclusions: *dreams are never concerned with things with which we should not think it worth while to be concerned during the day, and trivialities which do no affect us during the day are unable to pursue us in our sleep.*

What was the dream-instigator in the specimen that we have chosen for analysis? It was the definitely insignificant event of my friend giving me *a drive in a cab free of cost*. The situation in the dream at the table d'hôte contained an allusion to this insignificant precipitating cause, for in my conversation I had compared the taximeter cab with a table d'hôte. But I can also point to the important experience which was represented by this trivial one. A few days earlier I had paid out a considerable sum of money on behalf of a member of my family of whom I am fond. No wonder, said the dream-thoughts, if this person were to feel grateful to me: love of that sort would not be 'free of cost.' Love that is free of cost, however, stood in the forefront of the dream-thoughts. The fact that not long before I had had several *cab-drives* with the relative in question, made it possible for the cab-drive with my friend to remind me of my connections with this other person.

The indifferent impression which becomes a dream-instigator owing to associations of this kind is subject to a further condition which does not apply to the true source of the dream: it must always be a *recent* impression, derived from the dream-day.

I cannot leave the subject of dream-displacement without drawing attention to a remarkable process which occurs in the formation of dreams and in which condensation and displacement *combine* to produce the result. In considering condensation we have already seen the way in which two ideas in the dream-thoughts which have something in common, some point of contact, are replaced in the dream-content by a composite idea, in which a relatively distinct nucleus represents what they have in common, while indistinct subordinate details correspond to the respects in which they differ from each other. If displacement takes place in addition to condensation, what is constructed is not a composite idea but an 'intermediate common entity', which stands in a relation to the two different elements similar to that in which the resultant in a parallelogram of forces stands to its components. For instance, in the content of one of my dreams there was a question of an injection with *propyl*. To begin with, the analysis only led me to an indifferent experience which had acted as dream-instigator, and in which a part was played by *amyl*. I was not yet able to justify the confusion between *amyl* and *propyl*. In the group of ideas behind this same dream, however, there was also a recollection of my first visit to Munich, where I had been struck by the *Propylaea*. The details of the analysis made it plausible to suppose that it was the influence of this second group of ideas upon the first one that was responsible for the displacement from *amyl* to *propyl*. *Propyl* is as it were an intermediate idea between *amyl* and *Propylaea*, and found its way into the content of the dream as a kind of *compromise*, by means of simultaneous condensation and displacement.

There is a still more urgent necessity in the case of the process of displacement than in that of condensation to discover the motive for these puzzling efforts on the part of the dream-work.

VI

It is the process of displacement which is chiefly responsible for our being unable to discover or recognize the dream-thoughts in the dream-content, unless we understand the reason for their distortion. Nevertheless, the dream-thoughts are also submitted to another and milder sort of transformation, which leads to our discovering a new achievement on the part of the dream-work - one, however, which is easily intelligible. The dream-thoughts which we first come across as we proceed with our analysis often strike us by the unusual form in which they are expressed; they are not clothed in the prosaic language usually employed by our thoughts, but are on the contrary represented symbolically by means of similes and metaphors, in images resembling those of poetic speech. There is no difficulty in accounting for the constraint imposed upon the form in which the dream-thoughts are expressed. The manifest content of dreams consists for the most part in pictorial situations; and the dream-thoughts must accordingly be submitted in the first place to a treatment which will make them suitable for a representation of this kind. If we imagine ourselves faced by the problem of representing the arguments in a political leading article or the speeches of counsel before a court of law in a series of pictures, we shall easily understand the modifications which must necessarily be carried out by the dream-work owing to *considerations of representability in the content of the dream*.

The psychical material of the dream-thoughts habitually includes recollections of impressive experiences - not infrequently dating back to early childhood - which are thus themselves perceived as a rule as situations having a visual subject matter. Wherever the possibility arises, this portion of the dream-thoughts exercises a determining influence upon the form taken by the content of the dream; it constitutes, as it were, a nucleus of crystallization, attracting the material of the dream-thoughts to itself and thus affecting their distribution. The situation in a dream is often nothing other than a modified repetition, complicated by interpolations, of an impressive experience of this kind; on the other hand, faithful and straightforward reproductions of real scenes only rarely appear in dreams.

The content of dreams, however, does not consist entirely of situations, but also includes disconnected fragments of visual images, speeches and even bits of unmodified thoughts. It may therefore perhaps be of interest to enumerate very briefly the modes of representation available to the dream-work for reproducing the dream-thoughts in the peculiar form of expression necessary in dreams.

The dream-thoughts which we arrive at by means of analysis reveal themselves as a psychical complex of the most intricate possible structure. Its portions stand in the most manifold logical relations to one another: they represent foreground and background, conditions, digressions and illustrations, chains of evidence and counter-arguments. Each train of thought is almost invariably accompanied by its contradictory counterpart. This material lacks none of the characteristics that are familiar to us from our waking thinking. If now all of this is to be turned into a dream, the psychical material will be submitted to a pressure which will condense it greatly, to an internal fragmentation and displacement which will, as it were, create new surfaces, and to a selective operation in favour of those portions of it which are the most appropriate for the construction of situations. If we take into account the genesis of the material, a process of this sort deserves to be described as a 'regression.' In the course of this transformation, however, the logical links which have hitherto held the psychical material together are lost. It is only, as it were, the substantive content of the dream-thoughts that the dream-work takes over and manipulates. The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the work of analysis.

The modes of expression open to a dream may therefore be qualified as meagre by comparison with those of our intellectual speech; nevertheless a dream need not wholly abandon the possibility of reproducing the logical relations present in the dream-thoughts. On the contrary, it succeeds often enough in replacing them by formal characteristics in its own texture.

In the first place, dreams take into account the connection which undeniably exists between all the portions of the dream-thoughts by combining the whole material into a single situation. They reproduce *logical connection by approximation in space and time*, just as a painter will represent all the poets in a single group in a picture of Parnassus. It is true that they were never in fact assembled on a single mountain-top; but they certainly form a conceptual group. Dreams carry this method of reproduction down to details; and often when they show us two elements in the dream-content close together, this indicates that there is some specially intimate connection between what correspond to them among the dream-thoughts. Incidentally, it is to be observed that all dreams produced during a single night will be found on analysis to be derived from the same circle of thoughts.

A *causal relation* between two thoughts is either left unrepresented or is replaced by a *sequence* of two pieces of dream of different lengths. Here the representation is often reversed, the beginning of the dream standing for the consequence and its conclusion for the premise. An immediate *transformation* of one thing into another in a dream seems to represent the relation of *cause and effect*.

The alternative '*either-or*' is never expressed in dreams, both of the alternatives being inserted in the text of the dream as though they were equally valid. I have already mentioned that an '*either-or*' used in *recording* a dream is to be translated by '*and*'.

Ideas which are contraries are by preference expressed in dreams by one and the same element.¹ 'No' seems not to exist so far as dreams are concerned. Opposition between two thoughts, the relation of *reversal*, may be represented in dreams in a most remarkable way. It may be represented by some *other* piece of the dream-content being turned into its opposite - as it were by an afterthought. We shall hear presently of a further method of expressing contradiction. The sensation of *inhibition of movement* which is so common in dreams also serves to express a contradiction between two impulses, a *conflict of will*.

¹ [Footnote added 1911:] It deserves to be remarked that well-known philologists have asserted that the most ancient human languages tended in general to express contradictory opposites by the same word. (E.g. 'strong-weak', 'inside-outside.' This has been described as 'the antithetical meaning of primal words'.)

One and one only of these logical relations - that of *similarity, consonance, the possession of common attributes* - is very highly favoured by the mechanism of dream-formation. The dream-work makes use of such cases as a foundation for dream-condensation, by bringing together everything that shows an agreement of this kind into a new unity.

This short series of rough comments is of course inadequate to deal with the full extent of the formal means employed by dreams for the expression of logical relations in the dream-thoughts. Different dreams are more or less carefully constructed in this respect; they keep more or less closely to the text presented to them; they make more or less use of the expedients that are open to the dream-work. In the second case they appear obscure, confused and disconnected. If, however, a dream strikes one as *obviously* absurd, if its content includes a piece of palpable nonsense, this is intentionally so; its apparent disregard of all the requirements of logic is expressing a piece of the intellectual content of the dream-thoughts. Absurdity in a dream signifies the presence in the dream-thoughts of *contradiction, ridicule and derision*. Since this statement is in the most marked opposition to the view that dreams are the product of a dissociated and uncritical mental activity, I will emphasize it by means of an example.

One of my acquaintances, Herr M., had been attacked in an essay with an unjustifiable degree of violence, as we all thought - by no less a person than Goethe. Herr M. was naturally crushed by the attack. He complained of it bitterly to some company at table; his veneration for Goethe had not been affected, however, by this personal experience. I now tried to throw a little light on the chronological data, which seemed to me improbable. Goethe died in 1832. Since his attack on Herr M. must have been made earlier than that, Herr M. must have been quite a young man at the time. It seemed to be a plausible notion that he was eighteen. I was not quite sure, however, what year we were actually in, so that my whole calculation melted into obscurity. Incidentally, the attack was contained in Goethe's well-known essay on 'Nature'.

The nonsensical character of this dream will be even more glaringly obvious, if I explain that Herr M. is a youngish business man, who is far removed from any poetical and literary interests. I have no doubt, however, that when I have entered into the analysis of the dream I shall succeed in showing how much 'method' there is in its nonsense.

The material of the dream was derived from three sources:

(1) Herr M., whom I had got to know among some *company at table*, asked me one day to examine his elder brother, who was showing signs of general paralysis. In the course of my conversation with the patient an awkward episode occurred for he gave his brother away for no accountable reason by talking of his *youthful follies*. I had asked the patient the *year of his birth* (cf. the *year of Goethe's death* in the dream) and had made him carry out a number of calculations in order to test the weakness of his memory.

(2) A medical journal, which bore my name among others on its title-page, had published a positively '*crushing*' criticism by a youthful reviewer of a book by my friend F. in Berlin. I took the editor to task over this; but, though he expressed his regret, he would not undertake to offer any redress. I therefore severed my connection with the journal, but in my letter of resignation expressed a hope that *our personal relations would not be affected by the event*. This was the true source of the dream. The unfavourable reception of my friend's work had made a profound impression on me. It contained, in my opinion, a fundamental biological discovery, which is only now - many years later beginning to find favour with the experts.

(3) A woman patient of mine had given me an account a short time before of her brother's illness, and how he had broken out in a frenzy with cries of '*Nature! Nature!*' The doctors believed that his exclamation came from his having read Goethe's striking essay on that subject and that it showed he had been overworking at his studies. I had remarked that *it seemed to me more plausible* that his exclamation of the word 'Nature' should be taken in the sexual sense in which it is used by the less educated people here. This idea of mine was at least not disproved by the fact that the unfortunate young man subsequently mutilated his own genitals. He was *eighteen* at the time of his outbreak.

Behind my own ego in the dream-content there lay concealed, in the first instance, my friend who had been so badly treated by the critic. '*I tried to throw a little light on the chronological data.*' My friend's book dealt with the *chronological data* of life and among other things showed that the length of *Goethe's* life was a multiple of a number of days that has a significance in biology. But this ego was compared with a paralytic: '*I was not quite sure what year we were in.*' Thus the dream made out that my friend was behaving like a paralytic, and in this respect it was a mass of absurdities. The dream-thoughts, however, were saying ironically: 'Naturally, it's *he* who is the crazy fool and it's *you* who are the men of genius and know better. Surely it couldn't be the *reverse*?' There were plenty of examples of this *reversal* in the dream. For instance, Goethe attacked the young man, which is absurd, whereas it is still easy for quite a young man to attack the great Goethe.

I should like to lay it down that no dream is prompted by motives other than egoistic ones. In fact, the ego in the present dream does not stand only for my friend but for myself as well. I was identifying myself with him, because the fate of his discovery seemed to foreshadow the reception of my own findings. If I were to bring forward my theory emphasizing the part played by sexuality in the aetiology of psychoneurotic disorders (cf. the allusion to the eighteen-year-old patient's cry of 'Nature! Nature!'), I should come across the same criticisms; and I was already preparing to meet them with the same derision.

If we pursue the dream-thoughts further, we shall keep on finding ridicule and derision as correlates of the absurdities of the manifest dream. It is well known that it was the discovery of the split skull of a sheep on the Lido of Venice that gave Goethe the idea of the so-called 'vertebral' theory of the skull. My friend boasts that, when he was a student, he released a storm which led to the resignation of an old Professor who, though he had once been distinguished (among other things in connection precisely with the same branch of comparative anatomy), had become incapable of teaching owing to *senile dementia*. Thus the agitation which my friend promoted served to combat the mischievous system according to which there is no *age limit* for academic workers in German universities - for *age is proverbially no defence against folly*. - In the hospital here I had the honour of serving for years under a chief who had long been a *fossil* and had for decades been notoriously *feeble minded*, but who was allowed to continue carrying on his responsible duties. At this point I thought of a descriptive term based upon the discovery on the Lido.¹ Some of my young contemporaries at the hospital concocted, in connection with this man, a version of what was then a popular song: '*Das hat kein Goethe g'schrieben, das hat kein Schiller g'dicht . . .*'²

¹ ['*Schafkopf*', literally 'sheep's head', = 'silly ass.']

² ['This was written by no Goethe, this was composed by no Schiller.']

VII

We have not yet come to the end of our consideration of the dream-work. In addition to condensation, displacement and pictorial arrangement of the psychical material, we are obliged to assign it yet another activity, though this is not to be found in operation in every dream. I shall not deal exhaustively with this part of the dream-work, and will therefore merely remark that the easiest way of forming an idea of its nature is to suppose - though the supposition probably does not meet the facts - that it only comes into operation *after* the dream-content has already been constructed. Its function would then consist in arranging the constituents of the dream in such a way that they form an approximately connected whole, a dream-composition. In this way the dream is given a kind of façade (though this does not, it is true, hide its content at every point), and thus receives a first, preliminary interpretation, which is supported by interpolations and slight modifications. Incidentally, this revision of the dream-content is only possible if it is not too punctiliously carried out; nor does it present us with anything more than a glaring misunderstanding of the dream-thoughts. Before we start upon the analysis of a dream we have to clear the ground of this attempt at an interpretation.

The motive for this part of the dream-work is particularly obvious. *Considerations of intelligibility* are what lead to this final revision of a dream; and this reveals the origin of the activity. It behaves towards the dream-content lying before it just as our normal psychical activity behaves in general towards any perceptual content that may be presented to it. It understands that content on the basis of certain anticipatory ideas, and arranges it, even at the moment of perceiving it, on the presupposition of its being intelligible; in so doing it runs a risk of falsifying it, and in fact, if it cannot bring it into line with anything familiar, is a prey to the strangest misunderstandings. As is well known, we are incapable of seeing a series of unfamiliar signs or of hearing a succession of unknown words, without at once falsifying the perception from considerations of intelligibility, on the basis of something already known to us.

Dreams which have undergone a revision of this kind at the hands of a psychical activity completely analogous to waking thought may be described as 'well-constructed.' In the case of other dreams this activity has completely broken down; no attempt even has been made to arrange or interpret the material, and, since after we have woken up we feel ourselves identical with this last part of the dream-work, we make a judgement that the dream was 'hopelessly confused.' From the point of view of analysis, however, a dream that resembles a disordered heap of disconnected fragments is just as valuable as one that has been beautifully polished and provided with a surface. In the former case, indeed, we are saved the trouble of demolishing what has been superimposed upon the dream-content.

It would be a mistake, however, to suppose that these dream-façades are nothing other than mistaken and somewhat arbitrary revisions of the dream-content by the conscious agency of our mental life. In the erection of a dream-façade use is not infrequently made of wishful phantasies which are present in the dream-thoughts in a pre-constructed form, and are of the same character as the appropriately named 'day-dreams' familiar to us in waking life. The wishful phantasies revealed by analysis in night-dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the façade of the dream directly reveals the dream's actual nucleus, distorted by an admixture of other material.

The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream-thoughts into the dream-content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream-content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that *these intellectual operations have already been performed in the dream-thoughts and have only been TAKEN OVER by the dream-content*. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in the dream-thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream-content signifies nothing more than that there is a calculation in the dream-thoughts; but while the latter is always rational, a dream-calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream-content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream-thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed.

It will perhaps be as well to support these last assertions by a few examples.

(I) Here is an innocent-sounding, well-constructed dream dreamt by a woman patient:

She dreamt she was going to the market with her cook, who was carrying the basket. After she had asked for something, the butcher said to her: 'That's not obtainable any longer', and offered her something else, adding 'This is good too.' She rejected it and went on to the woman who sells vegetables, who tried to get her to buy a peculiar vegetable that was tied up in bundles but was of a black colour. She said: 'I don't recognize that; I won't take it.'

The remark '*That's not obtainable any longer*' originated from the treatment itself. A few days earlier I had explained to the patient in those very words that the earliest memories of childhood were '*not obtainable any longer* as such', but were replaced in analysis by 'transferences' and dreams. So *I* was the butcher.

The second speech - '*I don't recognize that*' - occurred in an entirely different connection. On the previous day she had reproved her cook, who incidentally also appeared in the dream, with the words: '*Behave yourself properly! I don't recognize that!*' meaning, no doubt, that she did not understand such behaviour and would not put up with it. As the result of a displacement, it was the more innocent part of this speech which made its way into the content of the dream; but in the dream-thoughts it was only the other part of the speech that played a part. For the dream-work had reduced to complete unintelligibility and extreme innocence an imaginary situation in which *I* was *behaving improperly* to the lady in a particular way. But this situation which the patient was expecting in her imagination was itself only a new edition of something she had once actually experienced.

(II) Here is an apparently quite meaningless dream containing figures. *She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you about? It only costs 21 kreuzers.'*

The dreamer came from abroad and her daughter was at school here. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The day before the dream the head-mistress had suggested to her that she should leave her daughter at school for another year. In that case she could also have continued her treatment for a year. The figures in the dream become significant if we remember that 'time is money.' One year is equal to 365 days, or, expressed in money, 365 kreuzers or 3 florins 65 kreuzers. The 21 kreuzers corresponded to the 3 weeks which had still to run between the dream-day and the end of the school term and also to the end of the patient's treatment. It was clearly financial considerations which had induced the lady to refuse the head mistress's proposal, and which were responsible for the smallness of the sums mentioned in the dream.

(III) A lady who, though she was still young, had been married for a number of years, received news that an acquaintance of hers, Fräulein Elise L., who was almost exactly her contemporary, had become engaged. This was the precipitating cause of the following dream:

She was at the theatre with her husband. One side of the stalls was completely empty. Her husband told her that Elise L. and her fiancé had wanted to go too; but had only been able to get bad seats - three for 1 florin 50 kreuzers - and of course they could not take those. She thought it would not really have done any harm if they had.

What interests us here is the source of the figures in the material of the dream-thoughts and the transformations which they underwent. What was the origin of the 1 florin 50 kreuzers? It came from what was in fact an indifferent event of the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had *been in a hurry* to get rid of them by buying a piece of jewellery. It is to be noticed that 150 florins is a *hundred* times as much as 1 florin 50 kreuzers. The only connection with the 'three', which was the number of the theatre tickets, was that her newly engaged friend was that number of months - three - her junior. The situation in the dream was a repetition of a small incident which her husband often teased her about. On one occasion she had been in a great hurry to buy tickets for a play in advance, and when she got to the theatre she had found that one side of the stalls was almost completely empty. There had been *no need for her to be in such a hurry*. Finally, we must not overlook the *absurdity* in the dream of two people taking three tickets for a play.

Now for the dream-thoughts: 'It was *absurd* to marry so early. There was *no need for me to be in such a hurry*. I see from Elise L.'s example that I should have got a husband in the end. Indeed, I should have got one *a hundred times better*' (a treasure) 'if I had only waited. My money' (or dowry) 'could have bought *three men just as good*.'

VIII

Having been made acquainted with the dream-work by the foregoing discussion, we shall no doubt be inclined to pronounce it a quite peculiar psychical process, the like of which, so far as we are aware, does not exist elsewhere. It is as though we were carrying over on to the dream-work all the astonishment which used formerly to be aroused in us by its product, the dream. In fact, however, the dream-work is only the first to be discovered of a whole series of psychical processes, responsible for of hysterical symptoms, of phobias, obsessions and delusions. Condensation and, above all, displacement are invariable characteristics of these other processes as well. Modification into a pictorial form, on the other hand, remains a peculiarity of the dream-work. If this explanation places dreams in a single series alongside the structures produced by psychical illness, this makes it all the more important for us to discover the essential determining conditions of such processes as those of dream-formation. We shall probably be surprised to hear that neither the state of sleep nor illness is among these indispensable conditions. A whole number of the phenomena of the everyday life of healthy people - such as forgetting, slips of the tongue, bungled actions and a particular class of errors - owe their origin to a psychical mechanism analogous to that of dreams and of the other members of the series.

The heart of the problem lies in displacement, which is by far the most striking of the special achievements of the dream-work. If we enter deeply into the subject, we come to realize that the essential determining condition of displacement is a purely psychological one: something in the nature of a *motive*. One comes upon its track if one takes into consideration certain experiences which one cannot escape in analysing dreams. In analysing my specimen dream I was obliged to break off my report of the dream-thoughts on p. 1059, because, as I confessed, there were some among them which I should prefer to conceal from strangers and which I could not communicate to other people without doing serious mischief in important directions. I added that nothing would be gained if I were to choose another dream instead of that particular one with a view to reporting its analysis: I should come upon dream-thoughts which required to be kept secret in the case of every dream with an obscure or confused content. If, however, I were to continue the analysis on my own account, without any reference to other people (whom, indeed, an experience so personal as my dream cannot possibly have been intended to reach), I should eventually arrive at thoughts which would surprise me, whose presence in me I was unaware of, which were not only *alien* but also *disagreeable* to me, and which I should therefore feel inclined to dispute energetically, although the chain of thoughts running through the analysis insisted upon them remorselessly. There is only one way of accounting for this state of affairs, which is of quite universal occurrence; and that is to suppose that these thoughts really were present in my mind, and in possession of a certain amount of psychical intensity or energy, but that they were in a peculiar psychological situation, as a consequence of which they *could not become conscious* to me. (I describe this particular condition as one of 'repression.')

We cannot help concluding, then, that there is a causal connection between the obscurity of the dream-content and the state of repression (in admissibility to consciousness) of certain of the dream-thoughts, and that the dream had to be obscure so as not to betray the proscribed dream-thoughts. Thus we are led to the concept of a 'dream-distortion', which is the product of the dream-work and serves the purpose of dissimulation, that is, of disguise.

I will test this on the specimen dream which I chose for analysis, and enquire what the thought was which made its way into that dream in a distorted form, and which I should be inclined to repudiate if it were undistorted. I recall that my free cab-drive reminded me of my recent expensive drive with a member of my family, that the interpretation of the dream was 'I wish I might for once experience love that cost me nothing', and that a short time before the dream I had been obliged to spend a considerable sum of money on this same person's account. Bearing this context in mind, I cannot escape the conclusion that *I regret having made that expenditure*. Not until I have recognized this impulse does my wish in the dream for the love which would call for *no* expenditure acquire a meaning. Yet I can honestly say that when I decided to spend this sum of money I did not hesitate for a moment. My regret at having to do so - the contrary current of feeling - did not become conscious to me. *Why* it did not, is another and a far-reaching question, the answer to which is known to me but belongs in another connection.

If the dream that I analyse is not my own, but someone else's, the conclusion will be the same, though the grounds for believing it will be different. If the dreamer is a healthy person, there is no other means open to me of obliging him to recognize the repressed ideas that have been discovered than by pointing out the context of the dream-thoughts; and I cannot help it if he refuses to recognize them. If, however, I am dealing with a neurotic patient, with a hysteric for instance, he will find the acceptance of the repressed thought forced upon him, owing to its connection with the symptoms of his illness, and owing to the improvement he experiences when he exchanges those symptoms for the repressed ideas. In the case, for instance, of the woman patient who had the dream I have just quoted about the three theatre tickets which cost 1 florin 50 kreuzers, the analysis led to the inevitable conclusion that she had a low estimate of her husband (cf. her idea that she could have got one 'a hundred times better'), that she regretted having married him, and that she would have liked to exchange him for another one. It is true that she asserted that she loved her husband, and that her emotional life knew nothing of any such low estimate of him, but all her symptoms led to the same conclusion as the dream. And after her repressed memories had been revived of a particular period during which she had consciously not loved her husband, her symptoms cleared up and her resistance against the interpretation of the dream disappeared.

IX

Now that we have established the concept of repression and have brought dream-distortion into relation with repressed psychical material, we can express in general terms the principal finding to which we have been led by the analysis of dreams. In the case of dreams which are intelligible and have a meaning, we have found that they are undisguised wish-fulfilments; that is, that in their case the dream-situation represents as fulfilled a wish which is known to consciousness, which is left over from daytime life, and which is deservedly of interest. Analysis has taught us something entirely analogous in the case of obscure and confused dreams: once again the dream-situation represents a wish as fulfilled - a wish which invariably arises from the dream-thoughts, but one which is represented in an unrecognizable form and can only be explained when it has been traced back in analysis. The wish in such cases is either itself a repressed one and alien to consciousness, or it is intimately connected with repressed thoughts and is based upon them. Thus the formula for such dreams is as follows: *they are disguised fulfilments of repressed wishes*. It is interesting in this connection to observe that the popular belief that dreams always foretell the future is confirmed. Actually the future which the dream shows us is not the one which *will* occur but the one which we should *like* to occur. The popular mind is behaving here as it usually does: what it wishes, it believes.

Dreams fall into three classes according to their attitude to wish-fulfilment. The first class consists of those which represent an unrepressed wish undisguisedly; these are the dreams of an infantile type which become ever rarer in adults. Secondly there are the dreams which express a repressed wish disguisedly; these no doubt form the overwhelming majority of all our dreams, and require analysis before they can be understood. In the third place there are the dreams which represent a repressed wish, but do so with insufficient or no disguise. These last dreams are invariably accompanied by anxiety, which interrupts them. In their case anxiety takes the place of dream distortion; and in dreams of the second class anxiety is only avoided owing to the dream-work. There is no great difficulty in proving that the ideational content which produces anxiety in us in dreams was once a wish but has since undergone repression.

There are also clear dreams with a distressing content, which, however, is not felt[/experienced] as distressing in the dream itself. For this reason they cannot be counted as anxiety-dreams; but they have always been taken as evidence of the fact that dreams are without meaning and have no psychical value. An analysis of a dream of this kind will show that we are dealing with well-disguised fulfilments of repressed wishes, that is to say with a dream of the second class; it will also show how admirably the process of displacement is adapted for disguising wishes.

A girl had a dream of seeing her sister's only surviving child lying dead in the same surroundings in which a few years earlier she had in fact seen the dead body of her sister's *first* child. She felt no pain over this; but she naturally rejected the idea that this situation represented any wish of hers. Nor was there any need to suppose this. It had been beside the first child's coffin, however, that, years before, she had seen and spoken to the man she was in love with; if the second child died, she would no doubt meet the man again in her sister's house. She longed for such a meeting, but fought against the feeling. On the dream-day she had bought a ticket for a lecture which was to be given by this same man, to whom she was still devoted. Her dream was a simple dream of impatience of the kind that often occurs before journeys, visits to the theatre, and similar enjoyments that lie ahead. But in order to disguise this longing from her, the situation was displaced on to an event of a kind most unsuitable for producing a feeling of enjoyment, though it had in fact done so in the past. It is to be observed that the emotional behaviour in the dream was appropriate to the real content which lay in the background and not to what was pushed into the foreground. The dream-situation anticipated the meeting she had so long desired; it offered no basis for any painful feelings.

X

Hitherto philosophers have had no occasion to concern themselves with a psychology of repression. We may therefore be permitted to make a first approach to this hitherto unknown topic by constructing a pictorial image of the course of events in dream-formation. It is true that the schematic picture we have arrived at - not only from the study of dreams - is a fairly complicated one; but we cannot manage with anything simpler. Our hypothesis is that in our mental apparatus there are two thought-constructing agencies, of which the second enjoys the privilege of having free access to consciousness for its products whereas the activity of the first is in itself unconscious and can only reach consciousness by way of the second. On the frontier between the two agencies, where the first passes over to the second, there is a censorship, which only allows what is agreeable to it to pass through and holds back everything else. According to our definition, then, what is rejected by the censorship is in a state of repression. Under certain conditions, of which the state of sleep is one, the relation between the strength of the two agencies is modified in such a way that what is repressed can no longer be held back. In the state of sleep this probably occurs owing to a relaxation of the censorship; when this happens it becomes possible for what has hitherto been repressed to make a path for itself to consciousness. Since, however, the censorship is never completely eliminated but merely reduced, the repressed material must submit to certain alterations which mitigate its offensive features. What becomes conscious in such cases is a compromise between the intentions of one agency and the demands of the other. *Repression - relaxation of the censorship - the formation of a compromise*, this is the fundamental pattern for the generation not only of dreams but of many other psychopathological structures; and in the latter cases too we may observe that the formation of compromises is accompanied by processes of condensation and displacement and by the employment of superficial associations, which we have become familiar with in the dream-work.

We have no reason to disguise the fact that in the hypothesis which we have set up in order to explain the dream-work a part is played by what might be described as a 'daemonic' element. We have gathered an impression that the formation of obscure dreams occurs *as though* one person who was dependent upon a second person had to make a remark which was bound to be disagreeable in the ears of this second one; and it is on the basis of this simile that we have arrived at the concepts of dream-distortion and censorship, and have endeavoured to translate our impression into a psychological theory which is no doubt crude but is at least lucid. Whatever it may be with which a further investigation of the subject may enable us to identify our first and second agencies, we may safely expect to find a confirmation of some correlate of our hypothesis that the second agency controls access to consciousness and can bar the first agency from such access.

When the state of sleep is over, the censorship quickly recovers its full strength; and it can now wipe out all that was won from it during the period of its weakness. This must be one part at least of the explanation of the forgetting of dreams, as is shown by an observation which has been confirmed on countless occasions. It not infrequently happens that during the narration of a dream or during its analysis a fragment of the dream-content which had seemed to be forgotten re-emerges. This fragment which has been rescued from oblivion invariably affords us the best and most direct access to the meaning of the dream. And that, in all probability, must have been the only reason for its having been forgotten, that is, for its having been once more suppressed.

XI

When once we have recognized that the content of a dream is the representation of a fulfilled wish and that its obscurity is due to alterations in repressed material made by the censorship, we shall no longer have any difficulty in discovering the *function* of dreams. It is commonly said that sleep is disturbed by dreams; strangely enough, we are led to a contrary view and must regard dreams as *the guardians of sleep*.

In the case of children's dreams there should be no difficulty in accepting this statement. The state of sleep or the psychical modification involved in sleep, whatever that may be, is brought about by a resolve to sleep which is either imposed upon the child or is reached on the basis of sensations of fatigue; and it is only made possible by the withholding of stimuli which might suggest to the psychical apparatus aims other than that of sleeping. The means by which *external* stimuli can be kept off are familiar to us; but what are the means available for controlling *internal* mental stimuli which set themselves against falling asleep? Let us observe a mother putting her child to sleep. The child gives vent to an unceasing stream of desires: he wants one more kiss, he wants to go on playing. His mother satisfies some of these desires, but uses her authority to postpone others of them to the next day. It is clear that any wishes or needs that may arise have an inhibiting effect upon falling asleep. We all know the amusing story told by Balduin Groller of the bad little boy who woke up in the middle of the night and shouted across the night nursery: 'I want the rhino!' A better behaved child, instead of shouting, would have *dreamt* that he was playing with the rhino. Since a dream that shows a wish as fulfilled is *believed* during sleep, it does away with the wish and makes sleep possible. It cannot be disputed that dream-images are believed in this way, for they are clothed in the psychical appearance of perceptions, and children have not yet acquired the later faculty of distinguishing hallucinations or phantasies from reality.

Adults have learnt to make this distinction; they have also grasped the uselessness of wishing, and after lengthy practice know how to postpone their desires until they can find satisfaction by the long and roundabout path of altering the external world. In their case, accordingly, wish-fulfilments along the short psychical path are rare in sleep too; it is even possible, indeed, that they never occur at all, and that anything that may seem to us to be constructed on the pattern of a child's dream in fact requires a far more complicated solution. On the other hand, in the case of adults - and this no doubt applies without exception to everyone in full possession of his senses - a differentiation has occurred in the psychical material, which was not present in children. A psychical agency has come into being, which, taught by experience of life, exercises a dominating and inhibiting influence upon mental impulses and maintains that influence with jealous severity, and which, owing to its relation to consciousness and to voluntary movement, is armed with the strongest instruments of psychical power. A portion of the impulses of childhood has been suppressed by this agency as being useless to life, and any thought-material derived from those impulses is in a state of repression.

Now while this agency, in which we recognize our normal ego, is concentrated on the wish to sleep, it appears to be compelled by the psycho-physiological conditions of sleep to relax the energy with which it is accustomed to hold down the repressed material during the day. In itself, no doubt, this relaxation does no harm; however much the suppressed impulses of the childish mind may prance around, their access to consciousness is still difficult and their access to movement is barred as the result of this same state of sleep. The danger of sleep being disturbed by them must, however, be guarded against. We must in any case suppose that even during deep sleep a certain amount of free attention is on duty as a guard against sensory stimuli, and that this guard may sometimes consider waking more advisable than a continuation of sleep. Otherwise there would be no explanation of how it is that we can be woken up at any moment by sensory stimuli of some particular *quality*. As the physiologist Burdach insisted long ago, a mother, for instance, will be roused by the whimpering of her baby, or a miller if his mill comes to a stop, or most people if they are called softly by their own name. Now the attention which is thus on guard is also directed towards internal wishful stimuli arising from the repressed material, and combines with them to form the dream which, as a compromise, simultaneously satisfies both of the two agencies. The dream provides a kind of psychical consummation for the wish that has been suppressed (or formed with the help of repressed material) by representing it as fulfilled; but it also satisfies the other agency by allowing sleep to continue. In this respect our ego is ready to behave like a child; it gives credence to the dream images, as though what it wanted to say was: 'Yes, yes! you're quite right, but let me go on sleeping!' The low estimate which we form of dreams when we are awake, and which we relate to their confused and apparently illogical character, is probably nothing other than the judgement passed by our sleeping ego upon the repressed impulses, a judgement based, with better right, upon the motor impotence of these disturbers of sleep. We are sometimes aware in our sleep of this contemptuous judgement. If the content of a dream goes too far in overstepping the censorship, we think: 'After all, it's only a dream!' - and go on sleeping.

This view is not traversed by the fact that there are marginal cases in which the dream - as happens with anxiety-dreams - can no longer perform its function of preventing an interruption of sleep, but assumes instead the other function of promptly bringing sleep to an end. In doing so it is merely behaving like a conscientious night-watchman, who first carries out his duty by suppressing disturbances so that the townsmen may not be woken up, but afterwards continues to do his duty by himself waking the townsmen up, if the causes of the disturbance seem to him serious and of a kind that he cannot cope with alone.

The function of the dream as a guardian of sleep becomes particularly evident when an external stimulus impinges upon the senses of a sleeper. It is generally recognized that sensory stimuli arising during sleep influence the content of dreams; this can be proved experimentally and is among the few certain (but, incidentally, greatly overvalued) findings of medical investigation into dreams. But this finding involves a puzzle which has hitherto proved insoluble. For the sensory stimulus which the experimenter causes to impinge upon the sleeper is not correctly recognized in the dream; it is subjected to one of an indefinite number of possible interpretations, the choice being apparently left to an arbitrary psychical determination. But there is, of course, no such thing as arbitrary determination in the mind. There are several ways in which a sleeper may react to an external sensory stimulus. He may wake up or he may succeed in continuing his sleep in spite of it. In the latter case he may make use of a dream in order to get rid of the external stimulus, and here again there is more than one method open to him. For instance, he may get rid of the stimulus by dreaming that he is in a situation which is absolutely incompatible with the stimulus. Such was the line taken by a sleeper who was subject to disturbance by a painful abscess on the perineum. He dreamt that he was riding on a horse, making use of the poultice that was intended to mitigate his pain as a saddle, and in this way he avoided being disturbed. Or, as happens more frequently, the external stimulus is given an interpretation which brings it into the context of a repressed wish which is at the moment awaiting fulfilment; in this way the external stimulus is robbed of its reality and is treated as though it were a portion of the psychical material. Thus someone dreamt that he had written a comedy with a particular plot; it was produced in a theatre, the first act was over, and there were thunders of applause; the clapping was terrific. . . . The dreamer must have succeeded in prolonging his sleep till after the interference had ceased; for when he woke up he no longer heard the noise, but rightly concluded that someone must have been beating a carpet or mattress. Every dream which occurs immediately before the sleeper is woken by a loud noise has made an attempt at explaining away the arousing stimulus by providing another explanation of it and has thus sought to prolong sleep, even if only for a moment.

XII

No one who accepts the view that the censorship is the chief reason for dream-distortion will be surprised to learn from the results of dream-interpretation that most of the dreams of adults are traced back by analysis to *erotic wishes*. This assertion is not aimed at dreams with an *undisguised* sexual content, which are no doubt familiar to all dreamers from their own experience and are as a rule the only ones to be described as 'sexual dreams.' Even dreams of this latter kind offer enough surprises in their choice of the people whom they make into sexual objects, in their disregard of all the limitations which the dreamer imposes in his waking life upon his sexual desires, and by their many strange details, hinting at what are commonly known as 'perversions.' A great many other dreams, however, which show no sign of being erotic in their manifest content, are revealed by the work of interpretation in analysis as sexual wish-fulfilments; and, on the other hand, analysis proves that a great many of the thoughts left over from the activity of waking life as 'residues of the previous day' only find their way to representation in dreams through the assistance of repressed erotic wishes.

There is no theoretical necessity why this should be so; but to explain the fact it may be pointed out that no other group of instincts has been submitted to such far-reaching suppression by the demands of cultural education, while at the same time the sexual instincts are also the ones which, in most people, find it easiest to escape from the control of the highest mental agencies. Since we have become acquainted with infantile sexuality: which is often so unobtrusive in its manifestations and is always overlooked and misunderstood, we are justified in saying that almost every civilized man retains the infantile forms of sexual life in some respect or other. We can thus understand how it is that repressed infantile sexual wishes provide the most frequent and strongest motive-forces for the construction of dreams.¹

¹ See my *Three Essays on the Theory of Sexuality* (1905d).

There is only one method by which a dream which expresses erotic wishes can succeed in appearing innocently non-sexual in its manifest content. The material of the sexual ideas must not be represented as such, but must be replaced in the content of the dream by hints, allusions and similar forms of indirect representation. But, unlike other forms of indirect representation, that which is employed in dreams must not be immediately intelligible. The modes of representation which fulfil these conditions are usually described as 'symbols' of the things which they represent. Particular interest has been directed to them since it has been noticed that dreamers speaking the same language make use of the same symbols, and that in some cases, indeed, the use of the same symbols extends beyond the use of the same language. Since dreamers themselves are unaware of the meaning of the symbols they use, it is difficult at first sight to discover the source of the connection between the symbols and what they replace and represent. The fact itself, however, is beyond doubt, and it is important for the technique of dream-interpretation. For, with the help of a knowledge of dream-symbolism, it is possible to understand the meaning of separate elements of the content of a dream or separate pieces of a dream or in some cases even whole dreams, without having to ask the dreamer for his associations. Here we are approaching the popular ideal of translating dreams and on the other hand are returning to the technique of interpretation used by the ancients, to whom dream-interpretation was identical with interpretation by means of symbols.

Although the study of dream-symbols is far from being complete, we are in a position to lay down with certainty a number of general statements and a quantity of special information on the subject. There are some symbols which bear a single meaning almost universally: thus the Emperor and Empress (or the King and Queen) stand for the parents, rooms represent women¹ and their entrances and exits the openings of the body. The majority of dream-symbols serve to represent persons, parts of the body and activities invested with erotic interest; in particular, the genitals are represented by a number of often very surprising symbols, and the greatest variety of objects are employed to denote them symbolically. Sharp weapons, long and stiff objects, such as tree-trunks and sticks, stand for the male genital; while cupboards, boxes, carriages or ovens may represent the uterus. In such cases as these the *tertium comparationis*, the common element in these substitutions, is immediately intelligible; but there are other symbols in which it is not so easy to grasp the connection. Symbols such as a staircase or going upstairs to represent sexual intercourse, a tie or cravat for the male organ, or wood for the female one, provoke our unbelief until we can arrive at an understanding of the symbolic relation underlying them by some other means. Moreover a whole number of dream-symbols are bisexual and can relate to the male or female genitals according to the context.

¹ Cf. 'Frauenzimmer' [literally 'women's apartment', commonly used in German as a slightly derogatory word for 'woman.']

Some symbols are universally disseminated and can be met with in all dreamers belonging to a single linguistic or cultural group; there are others which occur only within the most restricted and individual limits, symbols constructed by an individual out of his own ideational material. Of the former class we can distinguish some whose claim to represent sexual ideas is immediately justified by linguistic usage (such, for instance, as those derived from agriculture, e.g. 'fertilization' or 'seed') and others whose relation to sexual ideas appears to reach back into the very earliest ages and to the most obscure depths of our conceptual functioning. The power of constructing symbols has not been exhausted in our own days in the case of either of the two sorts of symbols which I have distinguished at the beginning of this paragraph. Newly discovered objects (such as airships) are, as we may observe, at once adopted as universally available sexual symbols.

It would, incidentally, be a mistake to expect that if we had a still profounder knowledge of dream-symbolism (of the 'language of dreams') we could do without asking the dreamer for his associations to the dream and go back entirely to the technique of dream-interpretation of antiquity. Quite apart from individual symbols and oscillations in the use of universal ones, one can never tell whether any particular element in the content of a dream is to be interpreted symbolically or in its proper sense, and one can be certain that the *whole* content of a dream is not to be interpreted symbolically. A knowledge of dream-symbolism will never do more than enable us to translate certain constituents of the dream-content, and will not relieve us of the necessity for applying the technical rules which I gave earlier. It will, however, afford the most valuable assistance to interpretation precisely at points at which the dreamer's associations are insufficient or fail altogether.

Dream-symbolism is also indispensable to an understanding of what are known as 'typical' dreams, which are common to everyone, and of 'recurrent' dreams in individuals.

If the account I have given in this short discussion of the symbolic mode of expression in dreams appears incomplete, I can justify my neglect by drawing attention to one of the most important pieces of knowledge that we possess on this subject. Dream-symbolism extends far beyond dreams: it is not peculiar to dreams, but exercises a similar dominating influence on representation in fairy-tales, myths and legends, in jokes and in folk-lore. It enables us to trace the intimate connections between dreams and these latter productions. We must not suppose that dream-symbolism is a creation of the dream-work; it is in all probability a characteristic of the unconscious thinking which provides the dream-work with the material for condensation, displacement and dramatization.¹

¹ Further information on dream-symbolism may be found in the works of early writers on dream-interpretation, e.g. Artemidorus of Daldis and Scherner (1861), and also in my own *Interpretation of Dreams* (1900a), in the mythological studies of the psycho-analytic school, as well as in some of W. Stekel's writings (e.g. 1911).

XIII

I lay no claim to having thrown light in these pages upon *all* the problems of dreams, nor to having dealt in a convincing way with those that I *have* discussed. Anyone who is interested in the whole extent of the literature of dreams may be referred to a work by Sante de Sanctis (*I sogni*, 1899); and anyone who wishes to hear more detailed arguments in favour of the view of dreams which I myself have put forward should turn to my volume *The Interpretation of Dreams*, 1900. It only remains for me now to indicate the direction in which my exposition of the subject of the dream-work calls for pursuit.

I have laid it down as the task of dream-interpretation to replace the dream by the latent dream-thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream-thoughts - a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream-content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream-thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

THE PSYCHOPATHOLOGY OF EVERYDAY LIFE

Forgetting, Slips of the Tongue, Bungled Actions, Superstitions and Errors

(1901)

Nun ist die Luft von solchem Spuk so voll,
Dass niemand weiss, wie er ihn meiden soll.

Faust, Part II, Act V, Scene 5

Now fills the air so many a haunting shape,
That no one knows how best he may escape.

CHAPTER I

THE FORGETTING OF PROPER NAMES

In the 1898 volume of the *Monatschrift für Psychiatrie und Neurologie* I published under the title of 'The Psychical Mechanism of Forgetfulness' a short paper the substance of which I shall recapitulate here and take as the starting-point for more extensive discussions. In it I applied psychological analysis to the frequent circumstance of proper names being temporarily forgotten, by exploring a highly suggestive example drawn from my self-observation; and I reached the conclusion that this particular instance (admittedly commonplace and without much practical significance), in which a psychical function - the memory - refuses to operate, admits of an explanation much more far-reaching than that which the phenomenon is ordinarily made to yield.

If a psychologist were asked to explain why it is that on so many occasions a proper name which we think we know perfectly well fails to enter our heads, he would, unless I am much mistaken, be satisfied with answering that proper names succumb more easily to the process of being forgotten than other kinds of memory-content. He would bring forward the plausible reasons why proper names should thus be singled out for special treatment, but would not suspect that any other conditions played their part in such occurrences.

My close preoccupation with the phenomenon of names being temporarily forgotten arose out of my observation of certain characteristics which could be recognized sufficiently clearly in individual cases, though not, it is true, in all of them. These are cases in which a name is in fact not only *forgotten*, but *wrongly remembered*. In the course of our efforts to recover the name that has dropped out, other ones - *substitute names* - enter our consciousness; we recognize them at once, indeed, as incorrect, but they keep on returning and force themselves on us with great persistence. The process that should lead to the reproduction of the missing name has been so to speak *displaced* and has therefore led to an incorrect substitute. My hypothesis is that this displacement is not left to arbitrary psychical choice but follows paths which can be predicted and which conform to laws. In other words, I suspect that the name or names which are substituted are connected in a discoverable way with the missing name: and I hope, if I am successful in demonstrating this connection, to proceed to throw light on the circumstances in which names are forgotten.

The name that I tried without success to recall in the example I chose for analysis in 1898 was that of the artist who painted the magnificent frescoes of the 'Four Last Things' in Orvieto cathedral. Instead of the name I was looking for - *Signorelli* - the names of two other painters - *Botticelli* and *Boltraffio* - thrust themselves on me, though they were immediately and decisively rejected by my judgement as incorrect. When I learnt the correct name from someone else, I recognized it at once and without hesitation. The investigation into the influences and the associative paths by which the reproducing of the name had been displaced in this way from *Signorelli* to *Botticelli* and *Boltraffio* led to the following results

(a) The reason why the name *Signorelli* was lost is not to be found in anything special about the name itself or in any psychological characteristic of the context into which it was introduced. The name I had forgotten was just as familiar to me as one of the substitute names - *Botticelli* - and much *more* familiar than the other substitute name - *Boltraffio* - about whose owner I could scarcely produce any information other than that he belonged to the Milanese school. Moreover the context in which the name was forgotten seemed to me harmless and did not enlighten me further. I was driving in the company of a stranger from Ragusa in Dalmatia to a place in Herzegovina: our conversation turned to the subject of travel in Italy, and I asked my companion whether he had ever been to Orvieto and looked at the famous frescoes there, painted by . . .

(b) Light was only thrown on the forgetting of the name when I recalled the topic we had been discussing directly before, and it was revealed as a case in which *a topic that has just been raised is disturbed by the preceding topic*. Shortly before I put the question to my travelling companion whether he had ever been to Orvieto, we had been talking about the customs of the Turks living in *Bosnia* and *Herzegovina*. I had told him what I had heard from a colleague practising among those people - that they are accustomed to show great confidence in their doctor and great resignation to fate. If one has to inform them that nothing can be done for a sick person, their reply is: '*Herr*, what is there to be said? If he could be saved, I know you would have saved him.' In these sentences we for the first time meet with the words and names *Bosnia*, *Herzegovina* and *Herr*, which can be inserted into an associative series between *Signorelli* and *Botticelli-Boltraffio*.

(c) I assume that the series of thoughts about the customs of the Turks in Bosnia, etc., acquired the capacity to disturb the next succeeding thought from the fact that I had withdrawn my attention from that series before it was brought to an end. I recall in fact wanting to tell a second anecdote which lay close to the first in my memory. These Turks place a higher value on sexual enjoyment than on anything else, and in the event of sexual disorders they are plunged in a despair which contrasts strangely with their resignation towards the threat of death. One of my colleague's patients once said to him: '*Herr*, you must know that if *that* comes to an end then life is of no value.' I suppressed my account of this characteristic trait, since I did not want to allude to the topic in a conversation with a stranger. But I did more: I also diverted my attention from thoughts which might have arisen in my mind from the topic of 'death and sexuality.' On this occasion I was still under the influence of a piece of news which had reached me a few weeks before while making a brief stay at *Trafoi*. A patient over whom I had taken a great deal of trouble had put an end to his life on account of an incurable sexual disorder. I know for certain that this melancholy event and everything related to it was not recalled to my conscious memory during my journey to Herzegovina. But the similarity between '*Trafoi*' and '*Boltraffio*' forces me to assume that this reminiscence, in spite of my attention being deliberately diverted from it, was brought into operation in me at the time.

(d) It is no longer possible for me to take the forgetting of the name *Signorelli* as a chance event. I am forced to recognize the influence of a *motive* in the process. It was a motive which caused me to interrupt myself while recounting what was in my mind (concerning the customs of the Turks, etc.), and it was a motive which further influenced me so that I debarred the thoughts connected with them, the thoughts which had led to the news at Trafoi, from becoming conscious in my mind. I wanted, therefore, to forget something; I had *repressed* something. What I wanted to forget was not, it is true, the name of the artist at Orvieto but something else - something, however, which contrived to place itself in an associative connection with his name, so that my act of will missed its target and I forgot *the one thing against my will*, while I wanted to forget *the other thing intentionally*. The disinclination to remember was aimed against one content; the inability to remember emerged in another. It would obviously be a simpler case if disinclination and inability to remember related to the same content. Moreover the substitute names no longer strike me as so entirely unjustified as they did before the matter was elucidated: by a sort of compromise they remind me just as much of what I wanted to forget as of what I wanted to remember; and they show me that my intention to forget something was neither a complete success nor a complete failure.

(e) The way in which the missing name and the repressed topic (the topic of death and sexuality, etc., in which the names of Bosnia, Herzegovina and Trafoi appeared) became linked is very striking. The schematic diagram which I have inserted at this point, and which is repeated from the 1898 paper, aims at giving a clear picture of this.

Fig. 1.

The name *Signorelli* has undergone a division into two pieces. One of the pairs of syllables (*elli*) recurs without alteration in one of the substitute names: while the other, by means of the translation of *Signor* into *Herr*, has acquired a numerous and miscellaneous set of relations to the names contained in the repressed topic, but for this reason is not available for reproduction. The substitute for it has been arrived at in a way that suggests that a displacement along the connected names of '*Herzegovina* and *Bosnia*' had taken place, without consideration for the sense or for the acoustic demarcation of the syllables. Thus the names have been treated in this process like the pictograms in a sentence which has had to be converted into a picture-puzzle (or rebus). Of the whole course of events that have in ways like these produced the substitute names instead of the name *Signorelli* no information has been given to consciousness. At first sight it seems impossible to discover any relation between the topic in which the name *Signorelli* occurred and the repressed topic which preceded it in time, apart from this recurrence of the same syllables (or rather sequence of letters).

Perhaps it is not superfluous to remark that the conditions which psychologists assume to be necessary for reproducing and for forgetting, and which they look for in certain relations and dispositions, are not inconsistent with the above explanation. All we have done is, in certain cases, to add a *motive* to the factors that have been recognized all along as being able to bring about the forgetting of a name; and, in addition, we have elucidated the mechanism of false recollection (paramnesia). These dispositions are indispensable to our case as well, in order to make it possible for the repressed element to get hold of the missing name by association and draw it with itself into repression. In the case of another name with more favourable conditions for reproduction this perhaps would not happen. It is probable indeed that a suppressed element always strives to assert itself elsewhere, but is successful in this only when suitable conditions meet it half way. At other times the suppression succeeds without any functional disturbance, or, as we can justly say, without any *symptom*.

The conditions necessary for forgetting a name, when forgetting it is accompanied by paramnesia, may then be summarized as follows: (1) a certain disposition for forgetting the name, (2) a process of suppression carried out shortly before, (3) the possibility of establishing an *external* association between the name and the element previously suppressed. The difficulty of fulfilling the last condition need probably not be rated very high, since, considering the low standards expected of an association of this kind, one could be established in the great majority of cases. There is, however, the profounder question whether an external association like this can really be a sufficient condition for the repressed element's disturbing the reproduction of the lost name - whether some more intimate connection between the two topics is required. On a superficial consideration one would be inclined to reject the latter demand, and accept as sufficient a temporal contiguity between the two, even if the contents are completely different. On close enquiry, however, one finds more and more frequently that the two elements which are joined by an external association (the repressed element and the new one) possess in addition some connection of content; and such a connection is in fact demonstrable in the *Signorelli* example.

The value of the insight that we have gained in analysing the *Signorelli* example naturally depends on whether we want to pronounce that instance as typical or as an isolated occurrence. I must affirm, that the forgetting of names, accompanied by paramnesia, takes place with uncommon frequency in the way in which we have explained it in the *Signorelli* case. In almost every instance in which I could observe this phenomenon in myself, I have also been able to explain it in the way described above, i.e. as motivated by repression. I must also draw attention to another consideration which supports the typical nature of our analysis. I think there is no justification for making a theoretical separation between those cases in which the forgetting of names is accompanied by paramnesia and the sort where incorrect substitute names have not presented themselves. These substitute names occur spontaneously in a number of cases; in others, where they have not emerged spontaneously, it is possible to force them to emerge by an effort of attention; and they then show the same relation to the repressed element and the missing name as they would if they had appeared spontaneously. Two factors seem to be decisive in bringing the substitute names to consciousness: first, the effort of attention, and secondly, an inner condition that attaches to the psychical material. We might look for the latter in the greater or lesser facility with which the necessary external association between the two elements establishes itself. A good portion of the cases of name-forgetting *without* paramnesia can thus be added to the cases in which substitute names are formed - to which the mechanism of the *Signorelli* example applies. I shall certainly not venture to affirm that all cases of name-forgetting are to be classed in the same group. There is no question that instances of it exist which are much simpler. We shall, I think, have stated the facts of the case with sufficient caution if we affirm: *By the side of simple cases where proper names are forgotten there is a type which is motivated by repression.*

CHAPTER II

THE FORGETTING OF FOREIGN WORDS

The current vocabulary of our own language, when it is confined to the range of normal usage, seems to be protected against being forgotten. With the vocabulary of a foreign language it is notoriously otherwise. The disposition to forget it extends to all parts of speech, and an early stage in functional disturbance is revealed by the fluctuations in the control we have over our stock of foreign words - according to the general condition of our health and to the degree of our tiredness. In a number of cases this kind of forgetting exhibits the same mechanism disclosed to us by the *Signorelli* example. In proof of this I shall give only a single analysis, one which is distinguished, however, by some useful characteristics: it concerns the forgetting of a non-substantival word in a Latin quotation. Perhaps I may be allowed to present a full and clear account of this small incident.

Last summer - it was once again on a holiday trip - I renewed my acquaintance with a certain young man of academic background. I soon found that he was familiar with some of my psychological publications. We had fallen into conversation - how I have now forgotten - about the social status of the race to which we both belonged; and ambitious feelings prompted him to give vent to a regret that his generation was doomed (as he expressed it) to atrophy, and could not develop its talents or satisfy its needs. He ended a speech of impassioned fervour with the well-known line of Virgil's in which the unhappy Dido commits to posterity her vengeance on Aeneas: '*Exoriare . . .*' Or rather, he *wanted* to end it in this way, for he could not get hold of the quotation and tried to conceal an obvious gap in what he remembered by changing the order of the words: '*Exoriar(e) ex nostris ossibus ultor.*' At last he said irritably: 'Please don't look so scornful: you seem as if you were gloating over my embarrassment. Why not help me? There's something missing in the line; how does the whole thing really go?'

'I'll help you with pleasure,' I replied, and gave the quotation in its correct form: '*Exoriar(e) ALIQUIS nostris ex ossibus ultor.*'

'How stupid to forget a word like that! By the way, you claim that one never forgets a thing without some reason. I should be very curious to learn how I came to forget the indefinite pronoun "*aliquis*" in this case.'

I took up this challenge most readily, for I was hoping for a contribution to my collection. So I said: 'That should not take us long. I must only ask you to tell me, *candidly* and *uncritically*, whatever comes into your mind if you direct your attention to the forgotten word without any definite aim.'¹

'Good. There springs to mind, then, the ridiculous notion of dividing up the word like this: *a* and *liquis*.'

'What does that mean?' 'I don't know.' 'And what occurs to you next?' 'What comes next is *Reliquien* [relics], *liquefying*, *fluidity*, *fluid*. Have you discovered anything so far?'

'No. Not by any means yet. But go on.'

'I am thinking,' he went on with a scornful laugh, 'of *Simon of Trent*, whose relics I saw two years ago in a church at Trent. I am thinking of the accusation of ritual blood-sacrifice which is being brought against the Jews again just now, and of *Kleinpaul's* book in which he regards all these supposed victims as incarnations, one might say new editions, of the Saviour.'

¹ This is the general method of introducing concealed ideational elements to consciousness. Cf. my *Interpretation of Dreams*, p. 604.

'The notion is not entirely unrelated to the subject we were discussing before the Latin word slipped your memory.'

'True. My next thoughts are about an article that I read lately in an Italian newspaper. Its title, I think, was "What St. *Augustine* says about Women." What do you make of that?'

'I am waiting.'

'And now comes something that is quite clearly unconnected with our subject.'

'Please refrain from any criticism and---'

'Yes, I understand. I am thinking of a fine old gentleman I met on my travels last week. He was a real *original*, with all the appearance of a huge bird of prey. His name was *Benedict*, if it's of interest to you.'

'Anyhow, here are a row of saints and Fathers of the Church: St. *Simon*, St. *Augustine*, St. *Benedict*. There was, I think, a Church Father called *Origen*. Moreover, three of these names are also first names, like *Paul* in *Kleinpaul*.'

'Now it's St. *Januarius* and the miracle of his blood that comes into mind - my thoughts seem to me to be running on mechanically.'

'Just a moment: St. *Januarius* and St. *Augustine* both have to do with the calendar. But won't you remind me about the miracle of his blood?'

'Surely you must have heard of that? They keep the blood of St. *Januarius* in a phial inside a church at Naples, and on a particular holy day it miraculously *liquefies*. The people attach great importance to this miracle and get very excited if it's delayed, as happened once at a time when the French were occupying the town. So the general in command - or have I got it wrong? was it Garibaldi? - took the reverend gentleman aside and gave him to understand, with an unmistakable gesture towards the soldiers posted outside, that he *hoped* the miracle would take place very soon. And in fact it did take place . . .

'Well, go on. Why do you pause?'

'Well, something *has* come into my mind . . . but it's too intimate to pass on. . . . Besides, I don't see any connection, or any necessity for saying it.'

'You can leave the connection to me. Of course I can't force you to talk about something that you find distasteful; but then you mustn't insist on learning from me how you came to forget your *aliquis*.'

'Really? Is that what you think? Well then, I've suddenly, thought of a lady from whom I might easily hear a piece of news that would be very awkward for both of us.'

'That her periods have stopped?'

'How could you guess that?'

'That's not difficult any longer; you've prepared the way sufficiently. Think of *the calendar saints, the blood that starts to flow on a particular day, the disturbance when the event fails to take place, the open threats that the miracle must be vouchsafed, or else* . . . In fact you've made use of the miracle of St. Januarius to manufacture a brilliant allusion to women's periods.'

'Without being aware of it. And you really mean to say that it was this anxious expectation that made me unable to produce an unimportant word like *aliquis*?'

'It seems to me undeniable. You need only recall the division you made into *a-liquis*, and your associations: *relics, liquefying, fluid*. St. Simon was *sacrificed as a child* - shall I go on and show how he comes in? You were led on to him by the subject of relics.'

'No, I'd much rather you didn't. I hope you don't take these thoughts of mine too seriously, if indeed I really had them. In return I will confess to you that the lady is Italian and that I went to Naples with her. But mayn't all this just be a matter of chance?'

'I must leave it to your own judgement to decide whether you can explain all these connections by the assumption that they are matters of chance. I can however tell you that every case like this that you care to analyse will lead you to "matters of chance" that are just as striking.'

¹ This short analysis has received much attention in the literature of the subject and has provoked lively discussion. Basing himself directly on it, Bleuler (1919) has attempted to determine mathematically the credibility of psycho-analytic interpretations, and has come to the conclusion that it has a higher probability value than thousands of medical 'truths' which have gone unchallenged, and that it owes its exceptional position only to the fact that we are not yet accustomed to take psychological probabilities into consideration in science.

I have several reasons for valuing this brief analysis; and my thanks are due to my former travelling-companion who presented me with it. In the first place, this is because I was in this instance allowed to draw on a source that is ordinarily denied to me. For the examples collected here of disturbances of a psychical function in daily life I have to fall back mainly on self-observation. I am anxious to steer clear of the much richer material provided by my neurotic patients, since it might otherwise be objected that the phenomena in question are merely consequences and manifestations of neurosis. My purpose is therefore particularly well served when a person other than myself, not suffering from nervous illness, offers himself as the object of such an investigation. This analysis is significant in a further respect: it throws light on the case of a word being forgotten *without* a substitute for it appearing in the memory. It thus confirms my earlier assertion that the appearance or non-appearance in the memory of incorrect substitutes cannot be made the basis for any radical distinction.¹

¹ Closer scrutiny somewhat diminishes the contrast between the analyses of *Signorelli* and of *aliquis* in regard to substitutive memories. In the latter example too it appears that the forgetting was accompanied by a substitutive formation. When subsequently I asked my companion whether in the course of his efforts to recall the missing word no substitute whatever came into his mind, he reported that at first he had felt a temptation to introduce an *ab* into the line (perhaps the detached portion of *a-liquis*) - *nostris ab ossibus*; and he went on to say that the *exoriare* had thrust itself on him with peculiar clarity and obstinacy, 'evidently,' he added with his characteristic scepticism, 'because it was the first word in the line.' When I asked him to attend all the same to the associations starting from *exoriare*, he produced *exorcism*. I can therefore very well believe that the intensification of *exoriare* when it was reproduced actually had the value of a substitutive formation of this sort. This substitute would have been arrived at from the names of the saints *viâ* the association 'exorcism.' These however are refinements to which one need attach no importance. (On the other hand Wilson, 1922, stresses the fact that the intensification of *exoriare* is of great significance to the understanding of the case, since exorcism would be the best symbolic substitute for repressed thoughts about getting rid of the unwanted child by abortion. I gratefully accept this correction, which does not weaken the validity, of the analysis.) It seems possible, however, that the appearance of any kind of substitute memory is a constant sign - even though perhaps only a characteristic and revealing sign - of tendentious forgetfulness which is motivated by repression. It would seem that substitutive formation occurs even in cases not marked by the appearance of incorrect names as substitutes, and that in these it lies in the intensification of an element that is closely related to the forgotten name. For example, in the *Signorelli* case, so long as the painter's name remained inaccessible, the visual memory that I had of the series of frescoes and of the self-portrait which is introduced into the corner of one of the pictures was *ultra-clear* - at any rate much more intense than visual memory-traces normally appear to me. In another case, also described in my 1898 paper, which concerned a visit which I was very reluctant to pay to an address in a strange town, I had forgotten the name of the street beyond all hope of recovery, but my memory of the house number, as if in derision, was *ultra-clear*, whereas normally I have the greatest difficulty in remembering numbers.

The chief importance however of the *aliquis* example lies in another of the ways in which it differs from the *Signorelli* specimen. In the latter, the reproducing of a name was disturbed by the after-effect of a train of thought begun just before and then broken off, whose content, however, had no clear connection with the new topic containing the name of Signorelli. Contiguity in time furnished the only relation between the repressed topic and the topic of the forgotten name; but this was enough to enable the two topics to find a connection in an external association.¹ Nothing on the other hand can be seen in the *aliquis* example of an independent repressed topic of this sort, which had engaged conscious thinking directly before and then left its echoes in a disturbance. The disturbance in reproduction occurred in this instance from the very nature of the topic hit upon in the quotation, since opposition unconsciously arose to the wishful idea expressed in it. The circumstances must be construed as follows. The speaker had been deploring the fact that the present generation of his people was deprived of its full rights; a new generation, he prophesied like Dido, would inflict vengeance on the oppressors. He had in this way expressed his wish for descendants. At this moment a contrary thought intruded. 'Have you really so keen a wish for descendants? That is not so. How embarrassed you would be if you were to get news just now that you were to expect descendants from the quarter you know of. No: no descendants - however much we need them for vengeance.' This contradiction then asserts itself by exactly the same means as in the *Signorelli* example - by setting up an external association between one of its ideational elements and an element in the wish that has been repudiated; this time, indeed, it does so in a most arbitrary fashion by making use of a roundabout associative path which has every appearance of artificiality. A second essential in which the present case agrees with the *Signorelli* instance is that the contradiction has its roots in repressed sources and derives from thoughts that would lead to a diversion of attention.

So much for the dissimilarity and the inner affinity between these two typical specimens of the forgetting of words. We have got to know a second mechanism of forgetting - the disturbance of a thought by an internal contradiction which arises from the repressed. Of the two processes this is, I think, the easier to understand; and we shall repeatedly come across it again in the course of this discussion.

¹ I am not entirely convinced of the absence of any internal connection between the two groups of thoughts in the *Signorelli* case. After all, if the repressed thoughts on the topic of death and sexual life are carefully followed up, one will be brought face to face with an idea that is by no means remote from the topic of the frescoes at Orvieto.

CHAPTER III

THE FORGETTING OF NAMES AND SETS OF WORDS

Observations such as those mentioned above, of what happens when a portion of a set of words in a foreign tongue is forgotten, may make us curious to know whether the forgetting of sets of words in our own language demands an essentially different explanation. We are not usually surprised, it is true, if a formula learnt by heart, or a poem, can be reproduced only inaccurately some time later, with alterations and omissions. Since, however, this forgetting does not have a uniform effect on what has been learnt as a whole but seems on the contrary to break off isolated portions of it, it may be worth the trouble to submit to analytic investigation a few instances of such faulty reproduction.

A younger colleague of mine told me in conversation that he thought it likely that the forgetting of poetry in one's own language could very well have motives similar to the forgetting of single elements from a set of words in a foreign tongue. At the same time he offered to be the subject of an experiment. I asked him on what poem he would like to make the test, and he chose 'Die Braut von Korinth,' a poem of which he was very fond and of which he thought he knew at least some stanzas by heart. At the beginning of his reproduction he was overcome by a rather remarkable uncertainty. 'Does it run "Travelling from Corinth to Athens",' he asked, 'or "Travelling to Corinth from Athens"?' I also had a moment's hesitation, until I laughingly observed that the title of the poem 'The Bride of Corinth' left no doubt which way the young man was travelling. The reproduction of the first stanza then proceeded smoothly or at any rate without any striking falsifications. My colleague seemed to search for a while for the first line of the second stanza; he soon continued, and recited as follows:

Aber wird er auch willkommen scheinen,
Jetzt jeder Tag was Neues bringt?
Denn er ist noch Heide mit den Seinen
Und sie sind Christen und - getauft.¹

Before he reached this point I had already pricked up my ears in surprise; and after the end of the last line we were both in agreement that some distortion had occurred here. But as we did not succeed in correcting it, we hurried to the bookcase to get hold of Goethe's poems, and found to our surprise that the second line of the stanza had a completely different wording, which had, as it were, been expelled from my colleague's memory and replaced by something that did not seem to belong. The correct version runs:

Aber wird er auch willkommen scheinen,
*Wenn er teuer nicht die Gunst erkaufte?*²

'*Getauft*' ['baptized,' two lines below] rhymes with '*erkaufte*', and it struck me as singular that the connected group of 'heathen', 'Christian' and 'baptized' should have given him so little help in restoring the text.

'Can you explain,' I asked my colleague, 'how you have so completely expunged a line in a poem that you claim you know so well, and have you any notion from what context you can have taken the substitute?'

¹ [Literally: 'But will he in fact seem welcome,
Now, when every day brings something new?
For he is still a heathen with his kindred
And they are Christians and baptized.']

² ['But will he in fact seem welcome *if he does not buy the favour dearly?*']

He was in a position to provide an explanation, though obviously with some reluctance. 'The line "Jetzt, wo jeder Tag was Neues bringt" seems familiar to me; I must have used the words a short time ago in referring to my practice - as you know, I am highly satisfied with its progress at the present time. But how does the sentence fit in here? I could think of a connection. The line "Wenn er teuer nicht die Gunst erkaufft" was obviously one which I found disagreeable. It is connected with a proposal of marriage which was turned down on the first occasion, and which, in view of the great improvement in my material position, I am now thinking of repeating. I cannot tell you any more, but if I am accepted now, it certainly cannot be enjoyable for me to reflect that some sort of calculation tipped the scale both then and now.'

This struck me as intelligible, even without my needing to know further particulars. But I continued with my questions: 'How in any case have you and your private affairs become involved in the text of the "Bride of Corinth"? Is yours perhaps a case that involves differences in religious belief like those that play an important part in the poem?'

(Keimt ein Glaube neu,
Wird oft Lieb' und Treu
Wie ein böses Unkraut ausgerauft.)¹

My guess was wrong; but it was curious to see how a single well-aimed question gave him a sudden perspicacity, so that he was able to bring me as an answer something of which he had certainly been unaware up to that time. He gave me a pained, even an indignant look, muttered a later passage from the poem:

Sieh sie an genau!
Morgen ist sie grau.²

and added shortly: 'She is rather older than I.' To avoid distressing him further I broke off the enquiry. The explanation struck me as sufficient. But it was certainly surprising that the attempt to trace a harmless failure of memory back to its cause should have had to come up against matters in the subject's private life that were so remote and intimate, and that were cathected with such distressing affect.

¹ ['When a faith is newly sprung up, love and troth are often torn out like an evil weed.']

² ['Look on her carefully. Tomorrow she will be grey.'] My colleague has incidentally made changes in this beautiful passage from the poem, somewhat altering both the wording and what the words refer to. The ghostly maiden says to her bridegroom:

'Meine Kette hab' ich dir gegeben;
Deine Locke nehm' ich mit mir fort.
Sieh sie an genau!
Morgen bist du grau,
Und nur braun erscheinst du wieder dort.'

['My necklace I have given thee; your lock of hair I take away with me. Look on it carefully. Tomorrow you will be grey, and you will appear brown again only there.' (The context shows that 'sie' ('it' or 'her') in the third line refers to the lock of hair. In a different context the line could mean: 'Look on her carefully'.)]

Here is another instance, given by Jung (1907, 64), of the forgetting of a set of words in a well-known poem. I shall quote the author's own words.

'A man was trying to recite the well-known poem that begins "*Ein Fichtenbaum steht einsam . . .*"¹ In the line beginning "*Ihn schläfert*"² he became hopelessly stuck; he had completely forgotten the words "*mit weisser Decke*". Forgetting something in so familiar a verse struck me as surprising, and I therefore made him reproduce what occurred to him in connection with "*mit weisser Decke*". He had the following train of associations: "A white sheet makes one think of a shroud - a linen sheet to cover a dead body" - (a pause) - "now a close friend occurs to me - his brother died recently quite suddenly - he is supposed to have died of a heart attack - he was also very stout - my friend is also stout, and I have thought before now that it might also happen to him - probably he takes too little exercise - when I heard of his brother's death I suddenly became anxious that it might *also* happen to me; for in our family we have in any case a tendency to fatness, and my grandfather, too, died of a heart attack; I have noticed that I too am over-stout and I have therefore begun a course of slimming recently."

'Thus,' comments Jung, 'the man had, unconsciously, identified himself at once with the fir-tree wrapped in the white shroud.'

¹ ['A fir-tree stands alone.']

² [The relevant lines are:

Ihn schläfert; mit weisser Decke
Umhüllen ihn Eis und Schnee.

He slumbers; with a white sheet
Ice and snow cover him.]

The following example of the forgetting of a set of words which I owe to my friend Sándor Ferenczi of Budapest, differs from the preceding ones in that it concerns a phrase coined by the subject himself and not a sentence taken from a writer. It may also present us with the somewhat unusual case in which the forgetting ranges itself on the side of our good sense, when the latter threatens to succumb to a momentary desire. The parapraxis thus comes to serve a useful function. When we have sobered down once more we appreciate the rightness of this internal current, which had previously only been able to express itself in a failure to function - a forgetting, a psychical impotence.

'At a social gathering someone quoted "*Tout comprendre c'est tout pardonner*". I made the comment that the first part of the sentence was enough; "pardoning" was a piece of arrogance: it should be left to God and the priests. One of those present thought this observation very good, and this emboldened me to say - probably with the intention of securing the good opinion of the benevolent critic - that I had recently thought of something better. But when I tried to repeat it I found it had escaped me. I immediately withdrew from the company and wrote down the screen-associations. There first occurred to me the names of the friend and of the street in Budapest that witnessed the birth of the idea I was looking for; next came the name of another friend, Max, whom we usually call Maxi. This led me to the word "maxim" and to the recollection that what we were after was, like my original remark, a variation on a well-known maxim. Strangely enough my next thought was not a maxim but the following sentence: "God created man in His own image" and the same idea in reverse: "Man created God in his." Thereupon the memory of what I was looking for immediately appeared. On that occasion my friend had said to me in Andrassy Street: "Nothing human is foreign to me", whereupon I had answered, in allusion to the discoveries of psycho-analysis: "You ought to have gone further and have admitted that nothing animal is foreign to you."

'But after I had at last remembered what I wanted, I was less than ever able to repeat it in the company I happened to be in. The young wife of the friend whom I had reminded of the animal nature of the unconscious was among those present, and I had to recognize that she was by no means prepared to receive such disagreeable truth. My forgetting spared me a number of unpleasant questions from her and a pointless discussion. This and nothing else must have been the motive for my "temporary amnesia".

'It is interesting that a screen-association was provided by a sentence in which the Deity is debased to the status of a human invention, while in the missing sentence there is an allusion to the animal in man. *Capitis diminutio* is therefore the element common to both. The whole subject is clearly only the continuation of the train of thought about understanding and forgiving which the conversation had instigated.

'The fact that what I was looking for in this case was so quick in presenting itself may perhaps be due also to my immediate withdrawal from the company where it was censored to an empty room.'

I have since undertaken numerous other analyses where forgetting or faulty reproduction of a set of words took place, and the consistent result of these investigations has inclined me to assume that the mechanism of forgetting demonstrated above in the instances of '*aliquis*' and 'The Bride of Corinth' has an almost universal validity. It is generally a little awkward to give an account of such analyses since, like those just mentioned, they constantly lead to matters which are of an intimate sort and are distressing to the person analysed. I shall therefore not give any further examples. What is common to all these cases, irrespective of the material, is the fact that the forgotten or distorted matter is brought by some associative path into connection with an unconscious thought-content - a thought-content which is the source of the effect manifested in the form of forgetting.

I now return to the forgetting of names. So far we have not exhaustively considered either the case-material or the motives behind it. As this is exactly the kind of parapraxis that I can from time to time observe abundantly in myself, I am at no loss for examples. The mild attacks of migraine from which I still suffer usually announce themselves hours in advance by my forgetting names, and at the height of these attacks, during which I am not forced to abandon my work, it frequently happens that all proper names go out of my head. Now it is precisely cases like mine which could furnish the grounds for an objection on principle to our analytic efforts. Should it not necessarily be concluded from such observations that the cause of forgetfulness, and in particular of the forgetting of names, lies in circulatory and general functional disturbances of the cerebrum, and should we not therefore spare ourselves the search for psychological explanations of these phenomena? Not at all, in my view; that would be to confuse the mechanism of a process, which is of the same kind in all cases, with the factors favouring the process, which are variable and not necessarily essential. Instead of a discussion, however, I shall bring forward an analogy to deal with the objection.

Let us suppose that I have been imprudent enough to go for a walk at night in a deserted quarter of the city, and have been attacked and robbed of my watch and purse. I report the matter at the nearest police station in the following words: 'I was in such and such a street, and there *loneliness* and *darkness* took away my watch and purse.' Although I should not have said anything in this statement that was not true, the wording of my report would put me in danger of being thought not quite right in the head. The state of affairs could only be described correctly by saying that *favoured* by the loneliness of the place and under the *shield* of darkness *unknown malefactors* robbed me of my valuables. Now the state of affairs in the forgetting of names need not be any different; favoured by tiredness, circulatory disturbances and intoxication, an unknown psychical force robs me of my access to the proper names belonging to my memory - a force which can in other cases bring about the same failure of memory at a time of perfect health and unimpaired efficiency.

If I analyse the cases of the forgetting of names that I observe in myself, I almost always find that the name which is withheld from me is related to a topic of close personal importance to me, and one capable of evoking in me strong and often distressing affects. In accordance with the convenient and commendable practice of the Zurich school (Bleuler, Jung, Riklin) I can also formulate this fact as follows: The lost name has touched on a 'personal complex' in me. The relation of the name to myself is one that I should not have expected and is usually arrived at through superficial associations (such as verbal ambiguity or similarity in sound); it can be characterized quite generally as an oblique relation. Its nature will best be illustrated by some simple examples.

(1) A patient asked me to recommend him a health resort on the Riviera. I knew of such a resort quite close to Genoa, and I also remembered the name of a German colleague of mine who practised there; but the name of the resort itself escaped me, well as I thought I knew that too. There was nothing left for me but to ask the patient to wait while I hurriedly consulted the ladies of my family. 'What on earth is the name of the place near Genoa where Dr. N. has his little sanatorium, the one in which so and so was under treatment for so long?' 'Of course you of all people would be the one to forget the name. The place is called *Nervi*.' I must admit I have plenty to do with *nerves*.

(2) Another patient was talking about a neighbouring summer resort, and declared that besides its two well-known inns there was a third one there with which a certain memory of his was connected; he would tell me the name in a moment. I disputed the existence of this third inn, and appealed to the fact that I had spent seven summers at the place and must therefore know it better than he did. But under the provocation of my contradiction he had already got hold of the name. The inn was called the 'Hochwartner'. At this point I was obliged to give in and I even had to confess that I had lived for seven whole summers close by the inn whose existence I had denied. Why in this instance should I have forgotten both the name and the thing? I believe it was because the name was only too similar in sound to that of a colleague, a specialist in Vienna and, once again, had touched upon the 'professional complex' in me.

(3) On another occasion, as I was on the point of booking a ticket at Reichenhall railway station, the name of the next main station would not come into my mind. It was perfectly familiar to me, and I had passed through it very frequently. I had actually to look it up in the time-table. It was '*Rosenheim*'. But I then knew at once owing to what association I had lost it. An hour before, I had paid a visit to my sister at her home close to Reichenhall; as my sister's name is Rosa this was also a '*Rosenheim*'. The 'family complex' had robbed me of this name.

(4) I have a whole quantity of examples to illustrate further the positively predatory activities of the 'family complex'.

There came to my consulting-room one day a young man who was the younger brother of a woman patient. I had seen him countless times and used to refer to him by his first name. When I wanted to speak about his visit I found I had forgotten his first name (which was, I knew, not at all an unusual one), and nothing could help me to recover it. I thereupon went out into the street to read the names over the shops, and recognized his name the first time I ran across it. The analysis of the episode showed me that I had drawn a parallel between the visitor and my own brother, a parallel which was trying to come to a head in the repressed question: 'Would my brother in the same circumstances have behaved in a similar way, or would he have done the opposite?' The external link between the thoughts concerned with my own and with the other family was made possible by the chance fact that in both cases the mothers had the same first name of Amalia. Later in retrospect I also understood the substitute names, Daniel and Franz, which had forced themselves on me without making me any wiser. These, like Amalia too, are names from Schiller's *Die Räuber* which were the subject of a jest made by *Daniel* Spitzer, the 'Vienna walker'.

(5) Another time I was unable to recall a patient's name; it belonged to associations from my youth. My analysis followed a very devious path before it provided me with the name I was looking for. The patient had expressed a fear of losing his sight; this awoke the memory of a young man who had been blinded by a gunshot; and this in turn was connected with the figure of yet another youth, who had injured himself by shooting. This last person had the same name as the first patient, though he was not related to him. However, I did not find the name until I had become conscious that an anxious expectation was being transferred by me from these two young men who had been injured to a member of my own family.

There thus runs through my thoughts a continuous current of 'personal reference', of which I generally have no inkling, but which betrays itself by such instances of my forgetting names. It is as if I were obliged to compare everything I hear about other people with myself; as if my personal complexes were put on the alert whenever another person is brought to my notice. This cannot possibly be an individual peculiarity of my own: it must rather contain an indication of the way in which we understand 'something other than ourself' in general. I have reasons for supposing that other people are in this respect very similar to me.

The neatest instance of this sort was reported to me by a Herr Lederer, who had experienced it himself. While he was on his honeymoon in Venice he came across a gentleman with whom he was superficially acquainted and whom he had to introduce to his young wife. Since however he had forgotten the stranger's name, he helped himself out the first time by means of an unintelligible mumble. On meeting the gentleman a second time, as he was bound to do in Venice, he drew him aside and asked him to save him from embarrassment by telling him his name, which he had unfortunately forgotten. The stranger's reply gave evidence of an unusual knowledge of human nature. 'I can readily imagine your failing to remember my name. I have the same name as you - *Lederer!*' - One cannot help having a slightly disagreeable feeling when one comes across one's own name in a stranger. Recently I was very sharply aware of it when a *Herr S. Freud* presented himself to me in my consulting hour. (However, I must record the assurance of one of my critics that in this respect his feelings are the opposite of mine.)

(6) The effects that can be produced by personal reference can also be seen in the following example, reported by Jung (1907, 52):

'A Herr Y. fell in love with a lady; but he met with no success, and shortly afterwards she married a Herr S. There after, Herr Y., in spite of having known Herr X. for a long time and even having business dealings with him, forgot his name over and over again, so that several times he had to enquire what it was from other people when he wanted to correspond with Herr X'.

The motivation of the forgetting is however more transparent in this case than in the preceding ones that fall within the constellation of personal reference. Here the forgetting seems a direct consequence of Herr Y's antipathy to his more fortunate rival; he wants to know nothing about him: 'never thought of shall he be.'

(7) The motive for forgetting a name may also be a more refined one; it may consist in what might be called a 'sublimated' grudge against the bearer of it. A Fräulein I. von K. writes from Budapest as follows:

'I have propounded a little theory of my own. I have noticed that people who have a talent for painting have no feeling for music, and vice versa. Some time ago I had a conversation with someone on this point, in which I remarked: "So far my observation has always held good, with the exception of only one person." When I wanted to recall that person's name, I found it had been irretrievably forgotten, even though I knew that the owner of it was one of my closest friends. When I heard the name mentioned quite by chance a few days later, I knew at once, of course, that it was the destroyer of my theory who was being spoken of. The grudge I unconsciously bore against him was expressed by my forgetting his name, which, apart from that, I knew so well.'

(8) The following case, reported by Ferenczi, shows a somewhat different way in which the personal reference led to a name being forgotten. Its analysis is particularly instructive because of the explanation it gives of the substitute associations (like Botticelli and Boltraffio as substitutes for Signorelli).

'A lady, who had heard something about psycho-analysis, could not recall the name of the psychiatrist Jung.¹

'The following names came to her mind instead: Kl--- (a name), Wilde, Nietzsche, Hauptmann.

'I did not tell her the name and invited her to give free associations to each name in turn.

'Starting from Kl--- she immediately thought of Frau Kl---, and of how she was a prim and affected person, but looked very well for her *age*. "She's *not ageing*." As a common characterization of Wilde and Nietzsche she named "insanity". Then she said chaffingly: "You Freudians will go on looking for the causes of insanity till you're insane yourselves." Then: "I can't bear Wilde and Nietzsche. I don't understand them. I hear they were both homosexuals; Wilde had dealings with *young* people." (In spite of having uttered the correct name - in Hungarian, it is true - in this sentence, she was still unable to recall it.)

'Starting from Hauptmann, first "*Halbe*" and then "*Jugend*" occurred to her; and it was there for the first time, after I had drawn her attention to the word "*Jugend*", that she realized she had been in search of the name *Jung*.

'This lady had lost her husband when she was thirty-nine and had no prospect of marrying again. Thus she had certainly reason enough to avoid recalling anything that reminded her of *youth* or *age*. It is striking that the ideas screening the missing name were associated entirely with its content and that associations with its sound were absent.'

¹ ['*Jung*' is also the German for 'young'.]

(9) Here is an example of name-forgetting with yet another and a very subtle motivation, which the subject of it has explained himself:

‘When I was being examined in philosophy as a subsidiary subject I was questioned by the examiner about the teachings of Epicurus, and after that I was asked if I knew who had taken up his theories in later centuries. I answered with the name of Pierre Gassendi, whom I had heard described as a disciple of Epicurus while I was sitting in a café only a couple of days before. To the surprised question how I knew that, I boldly answered that I had long been interested in Gassendi. The result of this was a certificate *magna cum laude*, but also unfortunately a subsequent obstinate tendency to forget the name Gassendi. My guilty conscience is, I think, to blame for my inability to remember the name in spite of all my efforts; for I really ought not to have known it on that occasion either.’

In order to appreciate the intensity of our informant’s aversion to recalling this examination episode, the reader would have to know the high value he sets on his doctorate and for how many other things it has to serve as a substitute.

(10) At this point I shall insert another example of the name of a town being forgotten. It is not perhaps as simple as the ones given above, but it will strike any one who is fairly well versed in investigations of this nature as authentic and valuable. The name of a town in Italy escaped the subject's memory as a consequence of its great similarity in sound to a woman's first name, with which a number of memories charged with affect were connected, which are doubtless not here reported in full. Sándor Ferenczi of Budapest, who observed this case of forgetting in himself, has treated it in the way in which one analyses a dream or a neurotic idea - a procedure which is fully justified.

'To-day I was with a family that I know, and the conversation turned to cities of North Italy. Someone observed that they still showed traces of Austrian influence. A few of these cities were mentioned, and I wanted to give the name of one too, but it escaped me, although I knew I had spent two very pleasant days there - a fact which did not agree very well with Freud's theory of forgetting. In place of the name I was looking for, the following associations forced themselves on me: *Capua, Brescia, The Lion of Brescia*.

'The picture that I had of this "Lion" took the form of a *marble statue* standing before my eyes like a solid object; I noticed at once, however, that it had less of a resemblance to the lion on the Monument to Freedom at Brescia (of which I have only seen illustrations) than to the other celebrated marble lion which I have seen on the *monument to the dead at Lucerne - the monument to the Swiss guards who fell at Tuileries*, and of which I have a miniature replica on my bookcase. And now at last the missing name came back to me: it was *Verona*.

'At the same time I knew at once who was to blame for my amnesia. It was no other than a former servant of the family whose guest I was at the time. Her name was *Veronika* (*Verona* in Hungarian), and I had a strong antipathy to her because of her repulsive looks, her *shrill, raucous voice* and her insufferable assertiveness, to which she believed herself entitled by her length of service. At the same time the *tyrannical way* in which she used to treat the children of the house was intolerable to me. I now also understood the meaning of the associations.

'My immediate association to *Capua* was *caput mortuum*. I very often compared Veronika's head to a death's head. The Hungarian word "*kapszfi*" (avaricious) doubtless provided an additional determinant for the displacement. I also, of course, found the much more direct associative paths which connect *Capua* and *Verona* as geographical idea and as Italian words that have the same rhythm.

'The same is true for *Brescia*; but here too there were winding by-paths in the linkage of ideas.

'My antipathy was at one time so violent that I found Veronika positively nauseating, and I had more than once expressed my astonishment that all the same it was possible for her to have an erotic life and be loved by someone. "Why," I said, "to kiss her would make one feel sick!"' Nevertheless, she could certainly long since have been brought into connection with the idea of the *fallen* Swiss Guards.

'*Brescia* is very often mentioned, at any rate here in Hungary, in connection not with the lion but with another *wild animal*. The most hated name in this country, and in the north of Italy too, is that of General *Haynau*, commonly known as the "*Hyaena of Brescia*". Thus one thread in my thoughts ran from the hated tyrant Haynau *viâ* Brescia to the town of Verona, while the other led, *viâ* the idea of the *animal that haunts the graves of the dead* (which helped to determine the emergence in my mind of a *monument to the dead*), to the death's head and to the disagreeable voice of Veronika - the victim of such gross abuse by my unconscious - who in her time had acted almost as tyrannically in this house as had the Austrian general after the Hungarian and Italian struggles for freedom.

'*Lucerne* is connected with the thought of the summer which Veronika spent with her employers *in the neighbourhood of the town of Lucerne*, on the lake of that name. The *Swiss Guard* in turn recalls that she knew how to play the tyrant not only to the children but also to the grown-up members of the family, and fancied herself in the part of a "Garde-Dame".

'I must expressly remark that this antipathy of mine towards Veronika is - consciously - something that has long been surmounted. Since those times both her appearance and her manner have changed, greatly to her advantage, and I can meet her, though I have in fact little occasion for doing so, with genuinely warm feelings. As usual, my unconscious clings more tenaciously to my impressions: it is "retrospective" and resentful.²

'The *Tuilleries* are an allusion to another person, an elderly French lady, who on many occasions actually "*guarded*" the women of the house; she was respected by everyone, young and old - and no doubt somewhat *feared* as well was feared. For a while I was her *élève* for French conversation. The word *élève* further recalls that when I was on a visit to the brother-in-law of my present host, in northern Bohemia, I was very much amused because the local country-people called the *élèves* at the school of forestry there by the name of "Löwen"³. This entertaining memory may also have played a part in the displacement from the hyaena to the lion.'

¹ [The first half of the German word for 'nausea' ('*Brechreiz*') has a sound similar to the first syllable of 'Brescia'.]

² [In German: "*nachträglich*" und *nachtragend*.']

³ [The dialect pronunciation of the first syllable of this word would resemble that of the second syllable of 'élèves'.]

(11) The next example, too, shows how a personal complex which is dominating someone at the time may cause a name to be forgotten in some very remote connection.

'Two men, an older and a younger one, who six months before had made a trip together in Sicily, were exchanging recollections of those pleasant and memorable days. "Let's see," said the younger, "what was the name of the place where we spent the night before making our trip to Selinunte? Wasn't it Calatafimi?" The older one rejected it: "No, it certainly wasn't, but I've forgotten the name too, though I recall most clearly all the details of our stay there. I only need to find someone else has forgotten a name, and it at once makes me forget it too. Let's look for the name. But the only thing that occurs to me is Caltanisetta, which certainly isn't right." "No," said the younger man, "the name begins with a 'w' or has a 'w' in it." "But there's no 'w' in Italian," objected the older. "I really meant a 'v', and I only said 'w' because I'm so used to it in my own language." The older man still opposed the "v". "As a matter of fact," he declared, "I believe I've forgotten a lot of the Sicilian names already; this would be a good time to make some experiments. For example, what was the name of the place on a hill that was called Enna in antiquity? Oh, I know - Castrogiovanni." The next moment the younger man had recalled the lost name as well. "Castelvetrano," he exclaimed, and was pleased at being able to point to the "v" he had insisted on. For a short while the older one had no sense of recognition; but after he had accepted the name it was for him to explain why he had forgotten it. "Obviously," he said, "because the second half, '-vetrano', sounds like 'veteran'. I know I don't much like to think about *growing old*, and I have strange reactions when I'm reminded of it. For instance, I recently charged a very dear friend of mine in the strangest terms with having 'left his youth far behind him', for the reason that once before, in the middle of the most flattering remarks about me, he had added that I was 'no longer a young man'. Another sign that my resistance was directed against the second half of the name Castelvetrano is that the initial sound recurred in the substitute name Caltanisetta." "What about the name Caltanisetta itself?" asked the younger man. "That," confessed the older one, "has always seemed to me like a pet name for a young woman."

'Some time later he added: "Of course the name for Enna was also a substitute name. And it occurs to me now that Castrogiovanni - a name that forced its way to the front with the help of a rationalization - sounds like '*giovane*' (young) in exactly the same way as the lost name Castelvetrano sounds like '*veteran*' (old)."

'The older man believed that in this way he had accounted for his forgetting the name. No investigation was made of the motive for the similar failure of the younger man's memory.'

Not only the motives, but also the mechanism governing the forgetting of names, deserve our interest. In a large number of cases a name is forgotten not because the name itself arouses such motives, but because - owing to similarity in sound and to assonance - it touches upon *another* name against which these motives do operate. If the determinants are relaxed in this way, the occurrence of the phenomenon will obviously be made very much easier, as the following examples show.

(12) Reported by Dr. Eduard Hitschmann (1913a): 'Herr N. wanted to give someone the name of the firm of book sellers Gilhofer and Ranschburg. But however much he thought over it, only the name Ranschburg occurred to him, though he knew the firm perfectly well. He returned home feeling somewhat dissatisfied, and thought it sufficiently important to ask his brother (who was apparently already asleep) what the first half of the firm's name was. His brother gave him the name without hesitation. Thereupon the word "Gallhof" immediately sprang to Herr N.'s mind as an association to "Gilhofer". Gallhof was the place where a few months before he had gone for a memorable walk with an attractive young lady. As a memento the lady had given him a present which was inscribed "A souvenir of the happy hours at Gallhof ". In the course of the days just before the name was forgotten, this present had been badly damaged, seemingly by accident, through N.'s shutting a drawer too hastily. He noticed this with a certain sense of guilt, for he was familiar with the meaning of symptomatic acts. At the time his feelings towards the lady were somewhat ambivalent: he certainly loved her, but he felt hesitation in the face of her desire that they should get married.'

(13) Reported by Dr. Hanns Sachs: 'In a conversation about Genoa and its immediate surroundings, a young man wanted to mention the place called *Pegli*, but could only recall the name with an effort after racking his brains. On the way home he thought of the distressing manner in which so familiar a name had slipped away, and in doing so was led to a word sounding very similar: *Peli*. He knew that there was a South Sea island of that name, whose inhabitants still retained a few remarkable customs. He had read about them recently in an ethnological work and had at the time made up his mind to use the information in support of a hypothesis of his own. It then occurred to him that *Peli* was also the setting of a novel which he had read with interest and enjoyment - namely *Van Zanten's glücklichste Zeit* by Laurids Bruun. The thoughts that had occupied his mind almost incessantly during the day centred round a letter he had received that same morning from a lady he was very fond of. This letter gave him reason to fear that he would have to forgo a meeting that had been arranged. After being in a very bad mood all day, he had gone out in the evening resolved not to plague himself any longer with the tiresome thought but to enjoy the social occasion in front of him, on which he in fact set an extremely high value, in as serene a mood as possible. It is clear that his resolution could have been gravely imperilled by the word *Pegli*, as its connection in sound with *Peli* was so close; and *Peli* in turn, having acquired a personal connection with himself by its ethnological interest, embodied not only Van Zanten's but also his own "happiest time", and therefore the fears and anxieties as well which he had nursed all day long. It is characteristic that this simple explanation only became clear after a second letter from his friend had transformed his doubt into the happy certainty of seeing her again soon.'

This example may recall what might be described as its geographical neighbour, in which the name of the town of Nervi could not be remembered (Example 1). Thus we see how a pair of words that are similar in sound can have the same effect as a single word that has two meanings.

(14) When war broke out with Italy in 1915 I was able to make the observation upon myself that a whole quantity of Italian place-names which at ordinary times were readily available to me had suddenly been withdrawn from my memory. Like so many other Germans I had made it my habit to spend a part of my holidays on Italian soil, and I could not doubt that this large-scale forgetting of names was the expression of an understandable hostility to Italy which had now replaced my former partiality. In addition to this directly motivated forgetting of names, however, an indirect amnesia could also be detected, which it was possible to trace back to the same influence. I showed a tendency to forget non-Italian place-names as well; and on investigating the incidents I found that these names were in some way connected by means of remote similarities of sound with the proscribed enemy names. Thus I tormented myself one day in trying to recall the name of the Moravian town of Bisenz. When it finally came to my mind I at once recognized that this act of forgetting was to be laid to the charge of the Palazzo Bisenzi at Orvieto. The Hotel Belle Arti, where I had stayed on all my visits to Orvieto, is located in this palazzo. The most precious memories had naturally been the most severely damaged by the change in my emotional attitude.

Some examples may also help to remind us of the variety of purposes that can be served by the parapraxis of name-forgetting.

(15) Reported by A. J. Storfer (1914): 'One morning a lady who lived in Basle received news that a friend of her youth, Selma X. of Berlin, who was just then on her honeymoon, was passing through Basle, but staying only one day. The Basle lady hurried straight away to her hotel. When the friends separated, they made an arrangement to meet again in the afternoon and to be with each other up to the time of the Berlin lady's departure.

'In the afternoon the Basle lady *forgot* about the rendezvous. I do not know what determined her forgetting it, yet in this particular situation (a meeting with a *school-friend who has just married*) various typical constellations are possible which could determine an inhibition against the repetition of the meeting. The point of interest in this case lies in a *further* parapraxis, which represents an unconscious safeguarding of the first one. At the time when she was to have met her friend from Berlin the Basle lady happened to be in company at another place. The recent marriage of the Viennese opera singer Kurz came up in conversation; the Basle lady gave vent to some critical remarks (!) about this marriage, but when she wanted to mention the singer by name, she found to her very great embarrassment that she could not think of her first name. (There is, as is well known, a particular tendency to give the first name also, precisely in cases where the surname is a monosyllable.) The Basle lady was all the more put out by her lapse of memory since she had often heard Kurz sing and ordinarily knew her (whole) name perfectly well. Before anyone had mentioned the missing first name the conversation took another direction.

'In the evening of the same day our Basle lady was among a number of people, some of whom were the same as those she had been with in the afternoon. By a coincidence the conversation again turned to the marriage of the Viennese singer; and without any difficulty the lady produced the name "*Selma* Kurz". "Oh dear!" she at once exclaimed, "it's just struck me - I've completely forgotten I had an appointment with my friend Selma this afternoon." A glance at the clock showed that her friend must have left already.'

We are perhaps not ready yet to appreciate all the aspects of this pretty example. The following is a simpler specimen, though here it was not a name but a foreign word that was forgotten, from a motive arising out of the situation. (We can already see that we are dealing with the same processes, whether they apply to proper names, first names, foreign words or sets of words.) Here it was a case of a young man forgetting the English word for '*Gold*' - which is identical with the German word - so as to find an opportunity for carrying out an action he desired.

(16) Reported by Dr. Hanns Sachs: 'A young man became acquainted in a pension with an English lady, whom he took a liking to. On the first evening of their acquaintance he was having a conversation with her in her native language, which he knew fairly well; and in the course of it he wanted to use the English word for "*Gold*". In spite of strenuous efforts the word would not come to him. Instead, the French *or*, the Latin *aurum* and the Greek *chrysos* obstinately forced themselves on him as substitutes, so that it needed quite an effort to reject them, though he knew for certain that they were not related at all to the word he was looking for. In the end the only way he could find of making himself understood was by touching a gold ring on the lady's hand; and he was very much abashed on learning from her that the long-lost word for gold was exactly the same as the German one, namely "gold". The great value of this touching, for which the forgetting gave an opportunity, did not lie merely in the unobjectionable satisfaction of the instinct for laying hold or touching - for there are other opportunities for this which are eagerly exploited by lovers. It lay much more in the way in which it assisted in clarifying the prospects of the courtship. The lady's unconscious would divine the erotic aim of the forgetting, hidden by its mask of innocence, especially if her unconscious was sympathetically drawn to the man she was talking with. The manner in which she treated his touching of her and accepted its motivation could in this way become a means - unconscious for both of them, yet full of significance - of reaching an understanding on the chances of the flirtation just begun.'

(17) From J. Störcke (1916) I report another interesting observation that concerns the forgetting and subsequent recovery of a proper name. This case is distinguished by the fact that the forgetting of the name was connected with the misquoting of a set of words from a poem, as in the example of the 'Bride of Corinth'.

'Z., an old jurist and philologist, was describing in company how in his student days in Germany he had known a quite exceptionally stupid student, and had some anecdotes to tell of his stupidity. He could not, however, recall the student's name; he believed it began with a "W", but later took back the idea. He recalled that the stupid student later became a *wine merchant*. He then told another anecdote about the student's stupidity, and once again expressed surprise that his name did not come back to him. "He was such an ass," he then remarked, "that I still don't understand how I succeeded in drumming Latin into his head." A moment later he remembered that the name he was looking for ended in ". . . *man*". At this point we asked him if any other name ending in "man" occurred to him, and he gave "*Erdmann*". "Who is that?" "That was another student of those days." His daughter, however, observed that there was also a Professor Erdmann. Some closer questioning revealed that this Professor Erdmann, who was the editor of a periodical, had recently refused to accept a piece of work submitted by Z., with which he partly disagreed, except in a shortened form; and Z. had been considerably put out. (In addition, I later discovered that years before, Z. had very probably expected to become professor in the same department in which Professor Erdmann now lectured. This, then, may have been another reason why the name touched on a sensitive spot.)

'At this point the stupid student's name suddenly came back to him: "Lindeman". Since he had already recalled that the name ended in "man", it was "*Linde*" that had remained repressed for longer. When he has asked what came to his mind when he thought of "*Linde*", he at first said "Absolutely nothing." When I urged that something connected with this word would no doubt occur to him, he remarked with an upward gaze and a gesture of his hand in the air: "A linden - well, a linden is a beautiful tree." Nothing further would come to his mind. No one spoke and everyone went on with their reading or other activity, till a few moments later Z. quoted the following passage in a dreamy voice:

Steht er mit festen
Gefügigen Knochen
Auf der *erde*,
So reicht er nicht auf
Nur mit der *Linde*
Oder der *Rebe*
Sich zu vergleichen.¹

'I gave a cry of triumph. "There's our Erdmann," I said. "The man who 'stands on the earth', that is to say the earthman or Erdmann, cannot reach up far enough to bear comparison with the linden (Lindeman) or the vine (wine merchant). In other words, our Lindeman, the stupid student, who later became a wine merchant, was certainly an ass, but our Erdmann is a much greater ass than that, and cannot even be compared with this Lindeman." - Such derisive or abusive language in the unconscious is quite usual; so it seemed to me that the chief cause of the name being forgotten had probably now been found.

¹ [Literally: 'If he stands with firm, pliant bones on the *earth*, he does not reach up far enough to bear comparison even with the *linden* or the *vine*.']

'I now asked what the poem was from which the lines were quoted. Z. said it was a poem by Goethe, which he thought began:

Edel sei der Mensch
Hilfreich und gut!¹

and which later contained the lines:

Und hebt er sich aufwärts,
So spielen mit ihm die Winde.²

'The next day I looked up this poem of Goethe's, and it turned out that the case was even prettier (though also more complex) than it had seemed at first.

(a) 'The first lines that he quoted run (cf. above):

Steht er mit festen
Markigen Knochen . . .³

"*Gefügige* Knochen" would be a rather peculiar combination; but I shall not go further into this point.

(b) 'The next lines of this stanza run (cf. above):

. . . Auf der *wohlgegründeten*
Dauernden Erde,
Reicht er nicht auf,
Nur mit der *Eiche*
Oder der Rebe
Sich zu vergleichen.⁴

So in the whole poem there is no mention of a linden. The change of "oak" into "linden" had taken place (in his unconscious) only in order to make the play on the words "earth-linden-vine" possible.

(c) 'This poem is called "Grenzen der Menschheit" and compares the omnipotence of the gods with man's puny strength. But the poem beginning:

Edel sei der Mensch,
Hilfreich und gut!

is a different one, appearing some pages further on. Its title is "Das Göttliche [The Divine Nature]", and it too contains thoughts about gods and men. As the matter was not gone into further I can at the most offer an opinion that thoughts about life and death, the temporal and the eternal, and the subject's own frail life and future death also played a part in bringing about the occurrence of this case.'

¹ ['Let Man be noble, helpful and good.']

² ['And if he raises himself upwards the winds play with him.']

³ ['If he stands with firm, *sturdy* bones . . .']

⁴ [' . . . on the *firmly-based, enduring* earth, he does not reach up far enough to bear comparison even with the *oak* or the vine.']

In some of these examples all the subtleties of psycho-analytic technique have to be called upon in order to explain the forgetting of a name. Anyone who wishes to learn more about such work may be referred to a paper by Ernest Jones of London (1911a). It has been translated into German.

(18) Ferenczi has observed that forgetting a name may also make its appearance as a hysterical symptom. In this situation it displays a very different mechanism from that of a parapraxis . The nature of this distinction may be seen from what he says:

‘At the moment I am treating a patient, a spinster getting on in years, in whose mind the most familiar and best-known proper names fail to appear, although her memory is otherwise good. In the course of the analysis it has become clear that this symptom is intended by her as a documentation of her ignorance. This demonstrative parade of her ignorance is, however, really a reproach against her parents, who did not let her have any higher education. Her tormenting obsession to clean things ("housewife's psychosis") also comes in part from the same source. What she means by this is something like: "You have turned me into a housemaid."'

I could cite further instances of the forgetting of names and explore the matter much more fully if I were not reluctant to anticipate at this first stage almost all the points of view that will come up for discussion under later topics. But I may perhaps allow myself to summarize in a few sentences the conclusions to be drawn from the analyses that have been reported here:

The mechanism of names being forgotten (or, to be more accurate, the mechanism of names escaping the memory, of being *temporarily* forgotten) consists in the interference with the intended reproduction of the name by an alien train of thought which is not at the time conscious. Between the name interfered with and the interfering complex either a connection exists from the outset, or else such a connection has established itself, often in ways that appear artificial, *viâ* superficial (external) associations.

Among the interfering complexes those of personal reference (i.e. the personal, family and professional complexes) prove to have the greatest effect.

A name which has more than one meaning and consequently belongs to more than one group of thoughts (complexes) is frequently interfered with in its connection with one train of thought owing to its participation in another, stronger complex.

Among the motives for these interferences the purpose of avoiding arousing unpleasure by remembering is conspicuous.

In general two main types of name-forgetting may be distinguished: those cases where the name itself touches on something unpleasant, and those where it is brought into connection with another name which has that effect. Thus names can have their reproduction interfered with on their own account, or because of their closer or remoter associative relations.

A survey of these general propositions shows us why the temporary forgetting of names is the most frequently to be observed of all our parapraxes.

(19) We are however far from having outlined all the characteristics of this phenomenon. There is a further point I wish to make. The forgetting of names is highly contagious. In a conversation between two people it is often sufficient for one of them merely to mention that he has forgotten such and such a name, and the result will be that it slips the other's mind as well. In cases like these, however, where the forgetting is induced, the forgotten name returns more readily. - This 'collective' forgetting, strictly speaking a phenomenon of group psychology, has not yet been made the subject of psycho-analytic study. In a single instance (but an especially, neat one) Reik (1920) has been able to offer a good explanation of this curious phenomenon.

'In a small gathering of university people, which included two women students of philosophy, there was a discussion on the numerous questions raised in the fields of religious studies and the history of civilization by the origin of Christianity. One of the young ladies who took part in the conversation recalled that in an English novel she had read recently she had found an interesting picture of the many religious currents by which that age had been stirred. She added that the novel portrayed the whole of Christ's life from his birth up to his death; but the name of the work refused to come to her mind. (The visual memory she had of the cover of the book and the appearance of the lettering in the title was excessively clear.) Three of the men who were present also said that they knew the novel, and they remarked that - strange to relate - they too were unable to produce the name.'

The young lady was the only one to subject herself to analysis in order to discover why this name was forgotten. The title of the book was *Ben Hur*, by Lewis Wallace. The ideas that had occurred to her as substitutes for it had been: '*Ecce homo*' - '*Homo sum*' - '*Quo vadis?*' The girl herself realized that she had forgotten the name 'because it contains an expression that I (like any other girl) do not care to use - especially in the company of young men'.¹ In the light of the very interesting analysis, this explanation took on a profounder significance. In the context already alluded to, the translation of '*homo*' (man) also has a disreputable meaning. Reik's conclusion is as follows: 'The young lady treated the word as though by uttering the questionable title in front of young men she would have been acknowledging the wishes which she had rejected as out of keeping with her character and distressing to her. More briefly: saying the words "Ben Hur"² was unconsciously equated by her with a sexual offer, and her forgetting accordingly, corresponded to the fending-off of an unconscious temptation of that kind. We have reason for supposing that similarly unconscious processes had determined the young men's forgetting. Their unconscious understood the real significance of the girl's forgetting and, so to speak, interpreted it. The men's forgetting shows respect for this modest behaviour. . . . It is as if the girl who was talking with them had by her sudden lapse of memory given a clear sign which the men had unconsciously understood well enough.'

¹ ['*Hure*' is the German for 'whore'.]

² [The German words '*bin Hure*' ('I am a whore') sound not unlike 'Ben Hur'.]

A type of continued forgetting of names occurs also, in which whole chains of names are withdrawn from the memory. If in the attempt to recover a lost name other names closely connected with it are pursued, it frequently happens that these new names, which were to serve as stepping stones to the other one, disappear in just the same way. The forgetting thus jumps from one name to another, as if to prove the existence of an obstacle which cannot easily be surmounted.

CHAPTER IV

CHILDHOOD MEMORIES AND SCREEN MEMORIES

In a second paper, which was published in the *Monatsschrift für Psychiatrie und Neurologie* (1899a), I was in a position to demonstrate at an unexpected point the tendentious nature of the workings of our memory. I started from the striking fact that a person's earliest childhood memories seem frequently to have preserved what is indifferent and unimportant, whereas (frequently, though certainly not universally) no trace is found in an adult's memory of impressions dating from that time which are important, impressive and rich in affect. It might be assumed from this - since it is known that the memory makes a selection from among the impressions offered to it - that in childhood the selection is conducted on entirely different principles from those which apply at the time of intellectual maturity. Careful investigation nevertheless shows that such an assumption is unnecessary. The indifferent memories of childhood owe their existence to a process of displacement: they are substitutes, in reproduction, for other impressions which are really significant. The memory of these significant impressions can be developed out of the indifferent ones by means of psychical analysis, but a resistance prevents them from being directly reproduced. As the indifferent memories owe their preservation not to their own content but to an associative relation between their content and another which is repressed, they have some claim to be called 'screen memories', the name by which I have described them.

In the paper which I have mentioned I only touched on and in no way exhausted the multiplicity of the relations and meanings of screen memories. In the example quoted there, of which I gave a detailed analysis, I laid special stress on the peculiarity of the *chronological* relation between the screen memory and the content which is screened off by it. In that example the content of the screen memory belonged to one of the earliest years of childhood, while the mental experiences which were replaced by it in the memory and which had remained almost unconscious occurred in the subject's later life, I described this sort of displacement as a *retroactive* or *retrogressive* one. The opposite relation is found perhaps still more frequently: an indifferent impression of recent date establishes itself in the memory as a screen memory, although it owes that privilege merely to its connection with an earlier experience which resistances prevent from being reproduced directly. These would be screen memories that have *pushed ahead* or been *displaced forward*. Here the essential thing with which the memory is occupied *precedes* the screen memory in time. Finally, we find yet a third possibility, in which the screen memory is connected with the impression that it screens not only by its content but also by contiguity in time: these are *contemporary* or *contiguous* screen memories.

How large a part of our store of memory falls into the category of screen memories, and what role they play in various neurotic thought-processes, are problems whose significance I neither discussed in my earlier paper nor shall enter into here. My only concern is to emphasize the similarity between the forgetting of proper names accompanied by paramnesia, and the formation of screen memories.

At first sight the differences between the two phenomena are much more striking than any analogies that may be found. The former phenomenon relates to proper names; the latter to whole impressions, things experienced either in reality or in thought. In the former we have a manifest failure of the function of memory; in the latter, an act of memory that strikes us as strange. In the former it is a case of momentary disturbance - for the name that has just been forgotten may have been produced correctly a hundred times before, and from tomorrow may be produced once again; in the latter it is a case of a permanent and constant memory, since the indifferent childhood memories seem to have the power of staying with us through a large part of our life. The problem in these two cases appears to be quite differently focused. In the former it is the forgetting, in the latter the retention which arouses our scientific curiosity. Closer study reveals that in spite of the dissimilarity between the two phenomena in regard to their psychical material and their duration, the points at which they agree far outbalance it. Both have to do with mistakes in remembering: what the memory reproduces is not what it should correctly have reproduced, but something else as a substitute. In the case of the forgetting of names the act of memory occurs, though in the form of substitute names; the case of the formation of screen memories has as its basis a forgetting of other more important impressions. In both instances an intellectual feeling gives us information of interference by some disturbing factor; but it takes two different forms. With the forgetting of names we *know* that the substitute names are *false*: with screen memories we are *surprised* that we possess them at all. If, now, psychological analysis establishes that the substitutive formation has come about in the same way in both cases, by means of displacement along a superficial association, it is precisely the dissimilarities between the two phenomena, in regard to their material, their duration and their focal point, which serve to heighten our expectation that we have discovered something of importance and of general validity. This general principle would assert that when the reproducing function fails or goes astray, the occurrence points, far more frequently than we suspect, to interference by a tendentious factor - that is, by a *purpose* which favours one memory while striving to work against another.

The subject of childhood memories seems to me to be of such significance and interest that I should like to devote to it a few additional observations which go beyond the views that I have so far expressed.

How far back into childhood do our memories extend? I am familiar with a few investigations into this question, such as those by V. and C. Henri (1897) and by Potwin (1901). They show that great individual differences exist among the persons examined: a few assign their earliest memories to the sixth month of life, while others remember nothing of their lives up to the end of their sixth or even eighth year. But with what are these differences in retaining childhood memories connected, and what significance attaches to them? Clearly it is not sufficient to assemble the material for answering these points by means of a questionnaire; what is required in addition is that it should be worked over - a process in which the person supplying the information must participate.

In my opinion we take the fact of infantile amnesia - the loss, that is, of the memories of the first years of our life - much too easily; and we fail to look upon it as a strange riddle. We forget how high are the intellectual achievements and how complicated the emotional impulses of which a child of some four years is capable, and we ought to be positively astonished that the memory of later years has as a rule preserved so little of these mental processes, especially as we have every reason to suppose that these same forgotten childhood achievements have not, as might be thought, slipped away without leaving their mark on the subject's development, but have exercised a determining influence for the whole of his later life. And in spite of this unique efficacy they have been forgotten! This suggests that there are conditions for remembering (in the sense of conscious reproducing) of a quite special kind, which have evaded recognition by us up to now. It may very well be that the forgetting of childhood can supply us with the key to the understanding of those amnesias which lie, according to our more recent discoveries, at the basis of the formation of all neurotic symptoms.

Of the childhood memories that have been retained a few strike us as perfectly understandable, while others seem odd or unintelligible. It is not difficult to correct certain errors regarding both sorts. If the memories that a person has retained are subjected to an analytic enquiry, it is easy to establish that there is no guarantee of their accuracy. Some of the mnemonic images are certainly falsified, incomplete or displaced in time and place. Any such statement by the subjects of the enquiry as that their first recollection comes from about their second year is clearly not to be trusted. Moreover, motives can soon be discovered which make the distortion and displacement of the experience intelligible, but which show at the same time that these mistakes in recollection cannot be caused simply by a treacherous memory. Strong forces from later life have been at work on the capacity of childhood experiences for being remembered - probably the same forces which are responsible for our having become so far removed in general from understanding our years of childhood.

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot's proposal, such people are called *auditifs* and *moteurs* in contrast to the *visuels*. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult *visuels* no longer see themselves.¹ Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.

¹ This statement is based on a number of enquiries I have made.

Anyone who has investigated a number of people psychologically by the method of psycho-analysis will in the course of his work have collected numerous examples of every kind of screen memory. However, the reporting of these examples is made extraordinarily difficult owing to the nature of the relations, which I have just discussed, between childhood memories and later life. In order to show that a childhood memory is to be regarded as a screen memory, it would often be necessary to present the complete life history of the person in question. Only rarely is it possible to lift a single screen memory out of its context in order to give an account of it, as in the following good example.

A man of twenty-four has preserved the following picture from his fifth year. He is sitting in the garden of a summer villa, on a small chair beside his aunt, who is trying to teach him the letters of the alphabet. He is in difficulties over the difference between *m* and *n* and he asks his aunt to tell him how to know one from the other. His aunt points out to him that the *m* has a whole piece more than the *n* - the third stroke. There appeared to be no reason for challenging the trustworthiness of this childhood memory; it had, however, only acquired its meaning at a later date, when it showed itself suited to represent symbolically another of the boy's curiosities. For just as at that time he wanted to know the difference between *m* and *n*, so later he was anxious to find out the difference between boys and girls, and would have been very willing for this particular aunt to be the one to teach him. He also discovered then that the difference was a similar one - that a boy, too, has a whole piece more than a girl; and at the time when he acquired this piece of knowledge he called up the recollection of the parallel curiosity of his childhood.

Here is another example, from the later years of childhood. A man who is severely inhibited in his erotic life, and who is now over forty, is the eldest of nine children. At the time that the youngest of his brothers and sisters was born he was fifteen, yet he maintains firmly and obstinately that he had never noticed any of his mother's pregnancies. Under pressure from my scepticism a memory presented itself to him: once at the age of eleven or twelve he had seen his mother hurriedly *unfasten* her skirt in front of the mirror. He now added of his own accord that she had come in from the street and had been overcome by unexpected labour pains. The unfastening of the skirt was a screen memory for the confinement. We shall come across the use of 'verbal bridges' of this kind in further cases.

I should like now to give a single example of the way in which a childhood memory, which previously appeared to have no meaning, can acquire one as a result of being worked over by analysis. When I began in my forty-third year to direct my interest to what was left of my memory of my own childhood there came to my mind a scene which had for a long while back (from the remotest past, as it seemed to me) come into consciousness from time to time, and which I had good evidence for assigning to a date before the end of my third year. I saw myself standing in front of a cupboard demanding something and screaming, while my half-brother, my senior by twenty years, held it open. Then suddenly my mother, looking beautiful and slim, walked into the room, as if she had come in from the street. These were the words in which I described the scene, of which I had a plastic picture, but I did not know what more I could make of it. Whether my brother wanted to open or shut the cupboard - in my first translation of the picture I called it a 'wardrobe' - why I was crying, and what the arrival of my mother had to do with it all this was obscure to me. The explanation I was tempted to give myself was that what was in question was a memory of being teased by my elder brother and of my mother putting a stop to it. Such misunderstandings of a childhood scene which is preserved in the memory are by no means rare: a situation is recalled, but it is not clear what its central point is, and one does not know on which of its elements the psychical accent is to be placed. Analytic effort led me to take a quite unexpected view of the picture. I had missed my mother, and had come to suspect that she was shut up in this wardrobe or cupboard; and it was for that reason that I was demanding that my brother should open the cupboard. When he did what I asked and I had made certain that my mother was not in the cupboard, I began to scream. This is the moment that my memory has held fast; and it was followed at once by the appearance of my mother, which allayed my anxiety or longing. But how did the child get the idea of looking for his absent mother in the cupboard? Dreams which I had at the same time contained obscure allusions to a nurse of whom I had other recollections, such as, for example, that she used to insist on my dutifully handing over to her the small coins I received as presents - a detail which can itself claim to have the value of a screen memory for later experiences. I accordingly resolved that this time I would make the problem of interpretation easier for myself and would ask my mother, who was by then grown old, about the nurse. I learned a variety of details, among them that this clever but dishonest person had carried out considerable thefts in the house during my mother's confinement and had been taken to court on a charge preferred by my half-brother. This information threw a flood of light on the childhood scene, and so enabled me to understand it. The sudden disappearance of the nurse had not been a matter of indifference to me: the reason why I had turned in particular to this brother, and had asked him where she was, was probably because I had noticed that he played a part in her disappearance; and he had answered in the elusive and punning fashion that was characteristic of him: 'She's "boxed up".' At the time, I understood this answer in a child's way, but I stopped asking any more questions as there was nothing more to learn. When my mother left me a short while later, I suspected that my naughty brother had done the same thing to her that he had done to the nurse and I forced him to open the cupboard for me. I now understand, too, why in the translation of this visual childhood scene my mother's slimness was emphasized: it must have struck me as having just been restored to her. I am two and a half years older than the sister who was born at that time, and when I was three years old my half-brother and I ceased living in the same place.¹

¹ [Footnote added 1924:] Anyone who is interested in the mental life of these years of childhood will find it easy to guess the deeper determinant of the demand made on the big brother. The child of not yet three had understood that the little sister who had recently arrived had grown inside his mother. He was very far from approving of this addition to the family, and was full of mistrust and anxiety that his mother's inside might conceal still more children. The wardrobe or cupboard was a symbol for him of his mother's inside. So he insisted on looking into this cupboard, and turned for this to his big brother, who (as is clear from other material) had taken his father's place as the child's rival. Besides the well-founded suspicion that this brother had had the lost nurse 'boxed up', there was a further suspicion against him - namely that he had in some way introduced the recently born baby into his mother's inside. The affect of disappointment when the cupboard was found to be empty derived, therefore, from the superficial motivation for the child's demand. As regards the *deeper* trend of thought, the affect was in the wrong place. On the other hand, his great satisfaction over his mother's slimness on her return can only be fully understood in the light of this deeper layer.

CHAPTER V

SLIPS OF THE TONGUE

The ordinary material which we use for talking in our native language appears to be protected against being forgotten; but it succumbs all the more frequently to another disturbance, which is known as a 'slip of the tongue'. The slips of the tongue that we observe in normal people give an impression of being the preliminary stages of the so-called 'paraphasias' that appear under pathological conditions. This is a subject on which I find myself in the exceptional position of being able to acknowledge the value of a previous work. In 1895 Meringer and C. Mayer published a study on 'Slips in Speaking and Reading'. Their lines of approach differ widely from my own. One of the authors, who acts as spokesman in the text, is in fact a philologist, and it was his linguistic interests which led him to attempt to discover the rules that govern the making of slips of the tongue. He hoped to be able to conclude from these rules that there exists 'a certain mental mechanism, in which the sounds of a word, or of a sentence, and the words as well, are mutually linked and connected in a quite peculiar way' (10).¹

¹ [Page references in this chapter, unless otherwise specified, are to Meringer and Mayer (1895).]

The examples of slips of the tongue collected by the authors are first grouped by them in purely descriptive categories. They are classed as *transpositions* (e. g. 'the Milo of Venus' instead of 'the Venus of Milo'); *pre-sonances* or *anticipations* (e. g. 'es war mir auf der Schwest . . . auf der Brust so schwer'¹); *post-sonances* or *perseverations* (e. g. 'Ich fordere Sie auf, auf das Wohl unseres Chefs aufzustossen' instead of 'anzustossen');² *contaminations* (e. g. 'er setzt sich auf den Hinterkopf', combined from 'er setzt sich einen Kopf auf' and 'er stellt sich auf die Hinterbeine');³ and *substitutions* (e. g. 'ich gebe die Präparate in den Briefkasten' instead of 'Brütkasten').⁴ There are in addition to these main categories a few others which are less important (or less significant from our own point of view). In the above arrangement into groups it makes no difference whether the transposition, distortion, amalgamation, etc., is concerned with single sounds in a word, with syllables, or with complete words forming part of the intended sentence.

To explain the various kinds of slips of the tongue he had observed, Meringer postulates that different spoken sounds have a different psychical valency. When we innervate the first sound in a word or the first word in a sentence, the excitatory process already extends to the later sounds and the following words, and in so far as these innervations are simultaneous with one another they can exercise a modifying influence on one another. The excitation of the sound that is psychically more intense anticipates other excitations or perseverates after them, and in this way disturbs the less valent process of innervation. The question has therefore to be decided which sounds in a word have the highest valency. Here is Meringer's view: 'If we want to know which sound in a word has the highest intensity, we must observe ourselves when we are searching for a forgotten word, e. g. for a name. Whichever is the first to come back into consciousness is in every case the one that had the greatest intensity before the word was forgotten' (160). 'The sounds which are of high valency are the initial sound in the root syllable, and the initial sound in the word, and the accentuated vowel or vowels' (162).

¹ [The intended phrase was: 'it lay so heavily on my breast (*Brust*).' The substituted '*Schwes*' is a non-existent word.]

² ['I call on you to *hiccough* to the health of our Principal' instead of '*drink to*.']

³ ['He stands on the back of his head' (a meaningless phrase) combined from 'He is obstinate' (literally, 'he puts on a head') and 'He gets on his hind legs'.]

⁴ ['I put the preparation into the letter-box' instead of 'incubator', literally 'hatching-box'.]

I cannot help contradicting him here. Whether the initial sound of the name is one of the elements of highest valency: a word or not, it is certainly untrue that in a forgotten word; is the first to return to consciousness. The rule stated above is therefore inapplicable. If we observe ourselves while searching for a forgotten name, we are comparatively often obliged to express a conviction that it begins with a particular letter. This conviction proves to be unfounded just as often as not. Indeed I should like to assert that in the majority of cases the initial sound which we announce is a wrong one. In our example of 'Signorelli', in fact, the substitute names had lost the initial sound and the essential syllables: it was precisely the less valent pair of syllables - *elli* - which returned to memory in the substitute name Botticelli.

How little attention is paid by the substitute names to the initial sound of the missing name may be learned, for instance, from the following case:

One day I found it impossible to recall the name of the small country of which *Monte Carlo* is the chief town. The substitute names for it ran: *Piedmont, Albania, Montevideo, Colico*. *Albania* was soon replaced in my mind by *Montenegro*; and it then occurred to me that the syllable 'Mont' (pronounced 'Mon') was found in all the substitute names except the last. Thus it was easy for me, starting from the name of Prince Albert, to find the forgotten name *Monaco*. *Colico* gives a pretty close imitation of the sequence of syllables and the rhythm of the forgotten name.

If we allow ourselves to suppose that a mechanism similar to that which has been demonstrated for the forgetting of names could also play a part in the phenomena of slips of the tongue, we are led to form a more deeply based judgement of instances of the latter. The disturbance in speaking which is manifested in a slip of the tongue can in the first place be caused by the influence of another component of the same speech - by an anticipatory sound, that is, or by a perseveration - or by another formulation of the ideas contained within the sentence or context that it is one's intention to utter. This is the type to which all the above examples borrowed from Meringer and Mayer belong. The disturbance could, however, be of a second kind, analogous to the process in the Signorelli case; it could result from influences *outside* this word, sentence or context, and arise out of elements which are not intended to be uttered and of whose excitation we only learn precisely through the actual disturbance. What these two ways in which slips of the tongue arise have in common would be the simultaneity of the interfering excitation; what differentiates them would be the position of the excitation inside or outside the sentence or context. The difference does not at first appear great in so far as it concerns certain deductions that can be made from the symptomatology of slips of the tongue. It is clear, however, that only in the former case is there any prospect of drawing conclusions from the phenomena of slips of the tongue about a mechanism which links sounds and words with one another so that they mutually influence their articulation - conclusions, that is, such as the philologist hoped to arrive at from studying slips of the tongue. In the case of interference from influences *outside* the same sentence or context of what is being said, it would be above all a matter of getting to know that the interfering elements are - after which the question would arise whether the mechanism of this disturbance, too, can reveal the supposed laws of speech formation.

Meringer and Mayer cannot be said to have overlooked the possibility that disturbances of speech may be the result of 'complicated psychical influences', of elements outside the same word, sentence or sequence of spoken words. They were bound to observe that the theory which asserts that sounds are of unequal psychical valency is strictly speaking only adequate for explaining sound-disturbances, together with sound-anticipations and perseverations. Where word-disturbances cannot be reduced to sound-disturbances (as, for instance, in substitutions and contaminations of words), they have not hesitated to look *outside* the intended context for the cause of the slip - a procedure which they justify by some good examples. I quote the following passages:

'Ru. was speaking of occurrences which, within himself he pronounced to be "*Schweinereien* [disgusting, literally piggish]". He tried, however, to express himself mildly, and began: "But then facts came to '*Vorschwein*' . . ."¹ Mayer and I were present and Ru. confirmed his having thought "*Schweinereien*". The fact of this word which he thought being betrayed in "*Vorschwein*" and suddenly becoming operative is sufficiently explained by the similarity of the words.' (62)

Just as in contaminations, so also - and probably to a much higher degree - in substitutions an important role is played by 'floating' or "wandering" speech images. Even if they are beneath the threshold of consciousness they are still near enough to be operative, and can easily be brought into play by any resemblance they may have to the complex that is to be spoken. When this is so they cause a deviation in the train of words or cut across it. "Floating" or "wandering" speech images are often, as we have said, stragglers following after speech processes which have recently terminated (perseverations).' (73)

'Resemblance can also cause a deviation when another, similar word lies a short way below the threshold of consciousness, *without a decision to speak it having been reached*. This is the case with substitutions. - Thus I hope that my rules will of necessity be confirmed when they are tested. But for this it is necessary (if the speaker is someone else) *that we should obtain a clear notion of everything that was in the speaker's thoughts*.² Here is an instructive case. Li., a schoolmaster, said in our presence: "Die Frau würde mir Furcht einlagen."³ I was taken aback, for the *I* struck me as inexplicable. I ventured to draw the speaker's attention to his slip in saying "einlagen" for "einjagen", upon which he at once replied: "Yes, the reason was that I thought: I should not be 'in der Lage [in a position]', etc."

¹ [Ru. intended to say 'came to "*light*"' and should have used the word '*Vorschein*'. Instead he used the meaningless word '*Vorschwein*'.]

² My italics.

³ [He intended to say: 'The lady would strike (*einjagen*) terror into me.' But instead of '*einjagen*' he said '*einlagen*', which is a non-existent verb - though '*Lage*' is a familiar noun meaning 'position'.]

'Here is another case. I asked R. von Schid. how his sick horse was getting on. He replied: "Ja, das *draut* . . . dauert vielleicht noch einen Monat."¹ I could not understand the "*draut*", with an *r*, for the *r* in "*dauert*" could not possibly have had this result. So I drew his attention to it, whereupon he explained that his thought had been: "das ist eine *traurige* Geschichte [it's a *sad* story]." Thus the speaker had two answers in his mind and they had been intermixed.' (97)

It is pretty obvious that the consideration of 'wandering' speech images which lie below the threshold of consciousness and are not intended to be spoken, and the demand for information about everything that had been in the speaker's mind, are procedures which constitute a very close approach to the state of affairs in our 'analyses'. We too are looking for unconscious material; and we even look for it along the same path, except that, in proceeding from the ideas that enter the mind of the person who is being questioned to the discovery of the disturbing element, we have to follow a longer path, through a complicated series of associations.

I shall dwell for a moment on another interesting process, to which Meringer's examples bear witness. The author himself holds that it is some sort of similarity between a word in the sentence intended to be spoken and another word not so intended which permits the latter to make itself felt in consciousness by bringing about a distortion, a composite figure, or a compromise-formation (contamination):

jagen,
lagen,

dauert,
traurig,

Vorschein
. . . schwein.

Now in my *Interpretation of Dreams* (1900a) I have demonstrated the part played by the work of *condensation* in forming what is called the manifest dream-content out of the latent dream-thoughts. A similarity of any sort between two elements of the unconscious material - a similarity between the things themselves or between their verbal presentations - is taken as an opportunity for creating a third, which is a composite or compromise idea. In the dream-content this third element represents both its components; and it is as a consequence of its originating in this way that it so frequently has various contradictory characteristics. The formation of substitutions and contaminations which occurs in slips of the tongue is accordingly a beginning of the work of condensation which we find taking a most vigorous share in the construction of dreams.

¹ [What he intended to say was: 'Well, it will last (*dauert*) another month perhaps.' Instead of '*dauert*' he used the meaningless word '*draut*']

In a short essay designed for a wider circle of readers Meringer (1900) has claimed that a special practical significance attaches to particular cases in which one word is put for another - viz. to those cases in which a word is replaced by another that has the opposite meaning. 'You probably still recall', he writes, 'the way in which the President of the Lower House of the Austrian Parliament *opened* the sitting a short while ago: "Gentlemen: I take notice that a full quorum of members is present and herewith declare the sitting *closed*!" His attention was only drawn by the general merriment and he corrected his mistake. In this particular case the explanation no doubt was that the President secretly *wished* he was already in a position to close the sitting, from which little good was to be expected. But this accompanying idea, as frequently happens, broke through, at least partially, and the result was "closed" instead of "open" - the opposite, that is, of what was intended to be expressed. Now extensive observations have taught me that words with opposite meanings are, quite generally, very often interchanged; they are already associated in our linguistic consciousness, they lie very close to each other and it is easy for the wrong one to be evoked.'

It cannot be said that in all cases where words are replaced by their opposites it is as easy as in this instance of the President to show the probability of the slip being a consequence of a contradiction arising in the speaker's mind against the uttered sentence. We found an analogous mechanism in our analysis of the *aliquis* example. There the internal contradiction expressed itself in a word being forgotten, instead of its being replaced by its opposite. But in order to soften the distinction we may note that the word *aliquis* is in fact incapable of having an opposite like 'to close' and 'to open', and that 'to open' is a word that cannot be forgotten as it is too familiar a part of our vocabulary.

If the last examples of Meringer and Mayer show that the disturbance of speech can arise on the one hand from the influence of anticipatory or perseverating sounds and words of the same sentence which are intended to be spoken, and on the other hand from the effect of words outside the intended sentence *whose excitation would not otherwise have been revealed*, the first thing we shall want to know is whether the two classes of slips of the tongue can be sharply divided, and how an example of one class can be distinguished from a case of the other. At this point in the discussion one must however bear in mind the views expressed by Wundt, who deals with the phenomena of slips of the tongue in the course of his comprehensive discussion of the laws of the development of speech.

According to him, a feature that is never missing from these and other related phenomena is the activity of certain psychical influences. 'First of all they have a positive determinant in the form of the uninhibited stream of *sound-associations* and *word-associations* evoked by the spoken sounds. In addition there is a negative factor in the form of the suppression or relaxation of the inhibitory effects of the will on this current, and of the attention which is also active here as a function of the will. Whether this play of association manifests itself by a coming sound being anticipated, or by the preceding sounds being reproduced, or by a habitually practised sound being intercalated between others, or finally by quite different words, which stand in an associative relation to the sounds that are spoken, having an effect upon them - all these indicate only differences in the direction and at the most in the scope of the associations taking place, and not differences in their general nature. In some cases, too, it may be doubtful to which form a certain disturbance is to be assigned, or whether it would not be more justifiable, *in accordance with the principle of the complication of causes*,¹ to trace it back to a concurrence of several motive forces.' (Wundt, 1900, 380-1.)

¹ My italics.

I consider these observations of Wundt's fully justified and very instructive. Perhaps it would be possible to emphasize more definitely than Wundt does that the positive factor favouring the slip of the tongue (the uninhibited stream of associations) and the negative factor (the relaxation of the inhibiting attention) invariably achieve their effect in combination, so that the two factors become merely different ways of regarding the same process. What happens is that, with the relaxation of the inhibiting attention - in still plainer terms, *as a result of* this relaxation - the uninhibited stream of associations comes into action.

Among the slips of the tongue that I have collected myself I can find hardly one in which I should be obliged to trace the disturbance of speech simply and solely to what Wundt calls the 'contact effect of sounds'. I almost invariably discover a disturbing influence in addition which comes from something *outside* the intended utterance; and the disturbing element is either a single thought that has remained unconscious, which manifests itself in the slip of the tongue and which can often be brought to consciousness only by means of searching analysis, or it is a more general psychical motive force which is directed against the entire utterance.

(1) My daughter had made an ugly face when she took a bite at an apple, and I wanted to quote to her:

Der Affe gar possierlich ist,
Zumal wenn er vom Apfel frisst.¹

But I began: 'Der Apfe . . .' [a non-existent word]. This looks like a contamination of 'Affe [ape]' and 'Apfel [apple]' (a compromise-formation), or it might be regarded as an anticipation of the word 'Apfel' that was in preparation. The circumstances were, however, more precisely as follows. I had already begun the quotation once before and had not made a slip of the tongue the first time. I only made a slip when I repeated it. The repetition was necessary because the person I was addressing had had her attention distracted from another quarter and she had not been listening to me. I must include the fact of the repetition, together with my impatience to have done with my sentence, among the motives of the slip which made its appearance as a product of condensation.

¹ [The ape's a very comic sight when from an apple he takes a bite.]

(2) My daughter said: 'I am writing to Frau Schresinger . . .' The lady's name is Schlesinger. This slip of the tongue is probably connected with a trend towards making articulation easier, for an / is difficult to pronounce after a repeated *r*. I must add, however, that my daughter made this slip a few minutes after I had said '*Apfe*' for '*Affe*'. Now slips of the tongue are in a high degree contagious, like the forgetting of names - a peculiar fact which Meringer and Mayer have noticed in the case of the latter. I cannot suggest any reason for this psychical contagiousness.

(3) 'I shut up like a *Tassenmescher* - I mean *Taschenmesser*', said a woman patient at the start of the hour of treatment. Here again a difficulty in articulation (cf. 'Wiener Weiber Wäscherinnen waschen weisse Wäsche', 'Fischflosse' and similar tongue-twisters) could serve as an excuse for her interchanging the sounds. When her attention was drawn to her slip, she promptly replied: 'Yes, that's only because you said "*Ernscht*" to-day.' I had in fact received her with the remark: 'To-day we shall really be in earnest' (because it was going to be the last session before the holidays), and had jokingly broadened '*Ernst*' into '*Ernscht*'. In the course of the hour she repeatedly made further slips of the tongue, and I finally observed that she was not merely imitating me but had a special reason for dwelling in her unconscious on the word '*Ernst*' in its capacity as a name.¹

¹ In fact she turned out to be under the influence of unconscious thoughts about pregnancy and contraception. By the words 'shut up like a pocket-knife', which she uttered consciously as a complaint, she wanted to describe the position of a child in the womb. The word '*Ernst*' in my opening remark had reminded her of the name (S. Ernst) of a well known Viennese firm in the Kärntnerstrasse which used to advertise the sale of contraceptives.

(4) 'I've got such a cold, I can't *durch die Ase natmen* - I mean, *Nase atmen*',¹ the same patient happened to say another time. She knew immediately how she had come to make the slip. 'Every day I get on the tram in Hasenauer Street, and while I was waiting for one to come along this morning it struck me that if I was French I should say "*Asenauer*", as the French always drop their aitches at the beginning of a word.' She then brought a series of reminiscences about French people of her acquaintance, and came in a very roundabout manner to a memory of having played the part of Picarde in the short play *Kürmarker und Picarde* when she was a girl of fourteen, and of having spoken broken German in the part. The chance arrival at her boarding house of a guest from Paris had awoken the whole series of memories. The interchanging of the sounds was therefore the result of a disturbance by an unconscious thought from an entirely different context.

(5) A slip of the tongue had a similar mechanism in the case of another woman patient, whose memory failed her in the middle of reproducing a long-lost recollection of childhood. Her memory would not tell her what part of her body had been grasped by a prying and lascivious hand. Immediately afterwards she called on a friend with whom she discussed summer residences. When she was asked where her cottage at M. was situated she answered: 'on the *Berglende* [hill-thigh]' instead of *Berglehne* [hill-side].

(6) When I asked another woman patient at the end of the session how her uncle was, she answered: 'I don't know, nowadays I only see him *in flagranti*.' Next day she began: 'I am really ashamed of myself for having given you such a stupid answer. You must of course have thought me a very uneducated person who is always getting foreign words mixed up. I meant to say: *en passant*.' We did not as yet know the source of the foreign phrase which she had wrongly applied. In the same session, however, while continuing the previous day's topic, she brought up a reminiscence in which the chief role was played by being caught *in flagranti*. The slip of the tongue of the day before had therefore anticipated the memory which at the time had not yet become conscious.

¹ [She meant to say: 'I can't breathe through my nose.' Her actual last two words, '*Ase natmen*', have no meaning.]

(7) At a certain point in the analysis of another woman patient I had to tell her that I suspected her of having been ashamed of her family during the period we were just then concerned with, and of having reproached her father with something we did not yet know about. She remembered nothing of the kind and moreover declared it was unlikely. However, she continued the conversation with some remarks about her family: 'One thing must be granted them: they are certainly unusual people, they all possess *Geiz* - I meant to say "*Geist*".' And this was in fact the reproach which she had repressed from her memory. It is a frequent occurrence for the idea one wants to withhold to be precisely the one which forces its way through in the form of a slip of the tongue. We may compare Meringer's case of 'zum Vorschwein gekommen'. The only difference is that Meringer's speaker wanted to keep back something that was in his consciousness, whereas my patient did not know what was being kept back, or, to put it in another way, did not know she was keeping something back and what that something was.

(8) The next example of a slip of the tongue is also to be traced back to something intentionally withheld. I once met two old ladies in the Dolomites who were dressed up in walking clothes. I accompanied them part of the way, and we discussed the pleasures and also the trials of spending a holiday in that way. One of the ladies admitted that spending the day like that entailed a good deal of discomfort. 'It is certainly not at all pleasant', she said, 'if one has been tramping all day in the sun and has perspired right through one's blouse and chemise.' In this sentence she had to overcome a slight hesitation at one point. Then she continued: 'But then when one gets "*nach Hose*" and can change . . .' No interpellation, I fancy, was necessary in order to explain this slip. The lady's intention had obviously been to give a more complete list of her clothes: blouse, chemise and *Hose*. Reasons of propriety led her to suppress any mention of the third article of linen. But in the next sentence, with its different subject-matter, the suppressed word emerged against her will, in the form of a distortion of the similar word '*nach Hause*'.

(9) 'If you want to buy carpets,' a lady said to me, 'you must go to Kaufmann [a proper name, also meaning 'merchant'] in the Matthäusgasse [Matthew Street]. I think I can give you recommendation there.' 'At Matthäus . . .' I repeated, 'I mean Kaufmann's.' My repeating one name in the other's place looks like a result of my thoughts being distracted. They really were distracted by what the woman said, for she diverted my attention to something much more important to me than carpets. As a matter of fact, the house in which my wife lived when she was my fiancée was in the Matthäusgasse. The entrance to the house was in another street, and I now noticed that I had forgotten its name and could only make it conscious in a round about way. The name Matthäus, which I was lingering over, was therefore a substitute name for the forgotten street-name. It was more suitable for this purpose than the name Kaufmann, for Matthäus is exclusively a personal name, while Kaufmann is not, and the forgotten street also bears the name of a person: Radetzky.

(10) The following case could just as appropriately be included in the chapter below on 'Errors', but I quote it here, since the phonetic relations, which were the basis of one word being put in place of another, are quite unusually clear. A woman patient told me a dream: A child had resolved to kill itself by means of a snake-bite. It carried out its resolution. She watched it writhing in convulsions, and so on. She had now to find the impressions of the previous day which the dream had taken as its starting point. She immediately recalled that on the previous evening she had listened to a public lecture on first aid for snake-bites. If an adult and a child were bitten at the same time, the child's injury should be attended to first. She also remembered what the lecturer had prescribed by way of treatment. It would very much depend, he had said, on what kind of snake caused the bite. I interrupted at this point and asked: Surely he must have said that we have very few poisonous kinds in these parts and he must have told you which are the dangerous ones? 'Yes, he particularly mentioned the "*Klapperschlange* [rattlesnake]".' My laughter drew her attention to her having said something wrong. She did not correct the *name*, but took back her statement: 'Yes, of course, they aren't found here; he was talking of the viper. How can I have got the idea of the rattlesnake?' I suspected it was due to interference by the thoughts which had hidden behind her dream. Suicide by means of a snake-bite could hardly be anything other than an allusion to the beautiful Cleopatra [in German: '*Kleopatra*']. The great similarity between the sound of the two words, the occurrence in both of the same letters 'Kl. . . p. . .' in the same order, and of the same stressed 'a', was unmistakable. The close connection between the names '*Klapperschlange*' and '*Kleopatra*' resulted in her judgement being momentarily restricted, so that she saw no objection to asserting that the lecturer had given his audience in Vienna instructions on how to treat rattlesnake bites. In the ordinary way she knew as well as I did that that species of snake is not among the fauna of our country. We will not blame her for her equal lack of hesitation in transferring the rattlesnake to Egypt, for it is usual for us to lump together everything which is non-European and exotic, and I had myself to reflect for a moment before declaring that the rattlesnake is confined to the New World.

The continuation of the analysis brought further confirmation. On the previous day the dreamer had for the first time inspected the Mark *Antony* monument by Strasser, which stood in the vicinity of her home. This then was the second exciting cause of the dream (the first having been the lecture on snake bites). In the continuation of the dream she was rocking a child in her arms. This scene reminded her of Gretchen. Further ideas which occurred to her brought reminiscences of *Arria und Messalina*. From the fact that the names of so many plays made their appearance in the dream-thoughts we may already have a suspicion that in her earlier years the dreamer had cherished a secret passion for the profession of actress. The beginning of the dream - 'A child had resolved to put an end to its life by means of a snake-bite' - had in fact no other meaning than that when she was a child she had made up her mind to become a famous actress one day. Finally, from the name 'Messalina' the path of thoughts branched off which led to the essential content of the dream. Certain recent events had made her apprehensive that her only brother might make a socially unsuitable marriage, a *mésalliance* with a non-Aryan [the latter from the 'Arria' part of the tragedy's title]

(11) I will reproduce here an entirely innocent example (of perhaps one whose motives were insufficiently elucidated), because it displays a transparent mechanism.

A German who was travelling in Italy needed a strap to tie up his damaged trunk. For 'strap' the dictionary gave him the Italian word '*corregia*'. It will be easy, he thought, to remember the word by thinking of the painter *Corregio*. After that he went into a shop and asked for '*una ribera*'.

He had apparently not been successful in replacing the German word by the Italian one in his memory but his efforts were nevertheless not entirely unsuccessful. He knew he had to keep in mind the name of a painter, and in this way he hit upon the name not of the painter who sounded much the same as the Italian word, but of another one who resembled the German word '*Riemen*'. I could of course have quoted the present case just as appropriately as an example of the for getting of a name rather than of a slip of the tongue.

When I was collecting slips of the tongue for the first edition of this book I proceeded by subjecting to analysis every case I was able to observe, and accordingly included the less impressive ones. Since then a number of other people have undertaken the amusing task of collecting and analysing slips of the tongue, and have thus enabled me to select from a richer material.

(12) A young man said to his sister: 'I've completely fallen out with the D.'s now. We're not on speaking terms any longer.' 'Yes indeed!' she answered, 'they're a fine *Lippschaft*.'¹ She meant to say '*Sippschaft*' [lot, crew], but in the slip she compressed two ideas: viz. that her brother had himself once begun a flirtation with the daughter of this family, and that this daughter was said to have recently become involved in a serious and irregular *Liebschaft* [love-affair].

¹ [A non-existent word.]

(13) A young man addressed a lady in the street in the following words: 'If you will permit me, madam, I should like to "*begleit-digen*" you.' It was obvious what his thoughts were: he would like to '*begleiten*' her, but was afraid his offer would '*beleidigen*' her. That these two conflicting emotional impulses found expression in one word - in the slip of the tongue, in fact - indicates that the young man's real intentions were at any rate not of the purest, and were bound to seem, even to himself, insulting to the lady. But while he attempted to conceal this from her, his unconscious played a trick on him by betraying his real intentions. But on the other hand he in this way, as it were, anticipated the lady's conventional retort: 'Really! What do you take me for? How dare you *insult* me!' (Reported by O. Rank.)

I will next quote a number of examples from an article by Stekel, entitled 'Unconscious Admissions', in the *Berliner Tageblatt* of January 4, 1904.

(14) 'An unpleasant part of my unconscious thoughts is disclosed by the following example. I may start by stating that in my capacity as a doctor I never consider my remuneration but only have the patient's interest in mind: that goes without saying. I was with a woman patient to whom I was giving medical attention in a period of convalescence after a serious illness. We had been though hard days and nights together. I was happy to find her improved; I painted a picture for her benefit of the delights of a stay in Abbazia, and concluded by saying: "If, as I hope, you will *not* leave your bed soon. . . ." This obviously owed its origin to an egoistic motive in the unconscious, namely that I should be able to continue treating this well-to-do patient some time longer - a wish that is entirely foreign to my waking consciousness and which I would indignantly repudiate.'

(15) Here is another example from Stekel. 'My wife was engaging a French governess for the afternoons, and after agreement had been reached on the terms, wanted to retain her testimonials. The Frenchwoman asked to be allowed to keep them, giving as her reason: *Je cherche encore pour les après-midis, pardon, pour le avant-midis* [I am still looking for work in the afternoons - I mean, in the forenoons]. She obviously had the intention of looking round elsewhere and perhaps finding better terms - an intention which she in fact carried out.'

(16) From Stekel: 'I had to give a stiff lecture to a wife; and her husband, at whose request I did it, stood outside the door listening. At the end of my sermon, which had made a visible impression, I said: "Good-bye, sir." To any well-informed person I was thus betraying the fact that my words were addressed to the husband and that I had spoken them for his benefit.'

(17) Stekel reports of himself that at one time he had two patients from Trieste in treatment whom he always used to address the wrong way round. 'Good morning, Herr Peloni', he would say to Askoli, and 'Good morning, Herr Askoli' to Peloni. He was at first inclined not to attribute any deeper motive to this confusion but to explain it as being due to the numerous points of resemblance between the two gentlemen. However it was easy for him to convince himself that the interchanging of the names corresponded in this case to a kind of boastfulness: he was able in this way to let each of his Italian patients know that he was not the only visitor from Trieste who had come to Vienna in search of his medical advice.

(18) Stekel reports that during a stormy General Meeting he said: 'We shall now *streiten*' (instead of '*schreiten*') 'to point four on the agenda.'

(19) A professor declared in his inaugural lecture: 'I am not *geneigt*' (instead of '*geeignet*') 'to describe the services of my most esteemed predecessor.'

(20) To a lady whom he suspected of having Graves' disease Stekel said: 'You are about a *Kropf*' (instead of '*Kopf*') 'taller than your sister.'

(21) Stekel reports: 'Someone wanted to describe the relationship of two friends and to bring out the fact that one of them was Jewish. He said: "They lived together like Castor and Pollak."¹ This was certainly not said as a joke; the speaker did not notice the slip himself until I drew his attention to it.'

¹ [Castor and Pollux were the 'heavenly twins' of Greek mythology. Pollak is a common Jewish name in Vienna.]

(22) Occasionally a slip of the tongue takes the place of a detailed characterization. A young woman who wore the breeches in her home told me that her sick husband had been to the doctor to ask what diet he ought to follow for his health. The doctor, however, had said that a special diet was not important. She added: 'He can eat and drink what I want.'

The following two examples given by Reik (1915) have their origin in situations where slips of the tongue occur especially easily - situations in which more must be kept back than can be said.

(23) A gentleman was offering his condolences to a young lady whose husband had recently died, and he intended to add: 'You will find consolation in *devoting* yourself entirely to your children.' Instead he said '*widwen*'.¹ The suppressed thought referred to consolation of another kind: a young and pretty widow will soon enjoy fresh sexual pleasures.

(24) At an evening party the same gentleman was having a conversation with the same lady about the extensive preparations being made in Berlin for Easter, and asked: 'Have you seen today's display at Wertheim's? The place is completely *decolated*.' He had not dared to express his admiration for the beautiful lady's *décolletage*, while the word '*Auslage*' was used unconsciously in two senses.

The same condition applies to another case, observed by Dr. Hanns Sachs, of which he has tried to give an exhaustive account:

(25) 'A lady was telling me about a common acquaintance. The last time she saw him, he was, she said, as elegantly dressed as ever: in particular he was wearing strikingly beautiful brown *Halbschuhe*. When I asked where she had met him she replied: "He rang at the door of my house and I saw him through the blinds, which were down. But I didn't open the door or give any other sign of life, as I didn't want him to know I was already back in town." While I was listening to her I had an idea that she was concealing something from me, most probably the fact that her reason for not opening the door was that she was not alone and not properly dressed to receive visitors; and I asked her somewhat ironically: "So you were able to admire his *Hausschuhe* - *Halbschuhe*, I mean - through the blinds when they were drawn?" In *Hausschuhe* I was giving expression to the thought of her *Hauskleid* which I had refrained from uttering. There was on the other hand a temptation to set rid of the word "*Halb*" for the reason that it was precisely this word which contained the core of the forbidden answer: "You are only telling me *half* the truth and are hiding the fact that you were *half* dressed." The slip of the tongue was encouraged by the additional circumstance that we had been talking directly before about this particular gentleman's married life, about his *häuslich* happiness; this no doubt helped to determine the displacement on to him. Finally, I must confess that envy on my part may perhaps have contributed to my placing this elegant gentleman in the street in house shoes; only recently I myself bought a pair of brown low shoes, which are certainly not "strikingly beautiful" any longer.'

¹ [A non-existent word.]

Times of war like the present produce numerous slips of the tongue which there is not much difficulty in understanding.

(26) 'What regiment is your son with?' a lady was asked. She replied: 'With the 42nd murderers'.

(27) Lieutenant Henrik Haiman writes from the front (1917): 'While I was reading an absorbing book, I was torn away to act temporarily as reconnaissance telephone operator. When the artillery post gave the signal to test the line I reacted with: "Duly tested and in order; *Ruhe*."¹ According to regulations the message should have run: "Duly tested and in order; *Schluss*." My aberration is to be explained by my annoyance at being interrupted while I was reading.'

(28) A sergeant instructed his men to give their people at home their correct addresses, so that 'Gespeckstücke' should not go astray.²

¹ ['Quiet'; often used as an exclamation: 'Silence!']

² [He meant to say 'Gepäckstücke' ('parcels'). 'Gespeckstücke' is a non-existent word; but 'Speckstücke' would mean 'bits of bacon'. The vowel after the 'p' has practically the same sound in each case (whether written 'e' or 'ä').]

(29) The following exceedingly fine example, which is also significant in view of its most unhappy background, I owe to Dr. L. Czeszer, who observed it while he was living in neutral Switzerland during the war and who analysed it exhaustively. I quote his letter verbatim with some inessential omissions:

'I am taking the liberty of sending you an account of a slip of the tongue of which Professor M. N. of O. University was the victim in one of the lectures that he gave on the psychology of feelings during the summer term which has just ended. I must start by saying that these lectures took place in the Aula of the University before a great crowd of interned French prisoners-of-war as well as of students, most of whom were French-Swiss whose sympathies lay strongly on the side of the *Entente*. In the town of O., as in France itself, "*boche*" is the name in universal and exclusive use for the Germans. But in public announcements, and in lectures and the like, senior public servants, professors and other persons in responsible positions make an effort, for the sake of neutrality, to avoid the ominous word.

'Professor N, was in the middle of discussing the practical significance of affects, and intended to quote an example illustrating how an affect can be deliberately exploited in such a way that a muscular activity which is uninteresting in itself becomes charged with pleasurable feelings, and so made more intense. He accordingly told a story - he was, of course, speaking in French - which had just then been reproduced in the local papers from a German one. It concerned a German schoolmaster who had put his pupils to work in the garden, and in order to encourage them to work with greater intensity invited them to imagine that with every clod of earth that they broke up they were breaking a French skull. Every time the word for "German" came up in the course of his story N. of course said "*allemand*" quite correctly and not "*boche*". But when he came to the point of the story he gave the school-master's words in the following form: *Imaginez-vous qu'en chaque moche vous écrasez le crâne d'un Français*. That is to say, instead of *motte* [the French word for 'clod'] - *mochel*!

'One can see very clearly how this scrupulous scholar took a firm grip on himself at the beginning of his story, to prevent himself from yielding to habit - perhaps even to temptation and from permitting a word that had actually been expressly proscribed by a federal decree to fall from the rostrum of the University Aula! And at the precise moment at which he had successfully said "*instituteur allemand*" with perfect correctness for what was the last time, and was hurrying with an inward sigh of relief to the conclusion, which seemed to offer no pitfalls - the word which had been suppressed with so much effort caught hold of the similar-sounding '*motte*', and the damage was done. Anxiety about committing a political indiscretion, perhaps a suppressed desire to employ the usual word in spite of everything - the word that everyone expected - and the resentment of one who was born a republican and a democrat at every restriction on the free expression of opinion - all these interfered with his main intention of giving a punctilious rendering of the illustration. The interfering trend was known to the speaker and he had, as we cannot but suppose, thought of it directly before he made the slip of the tongue.

'Professor N. did not notice his slip: at least he did not correct it, which is something one usually does quite automatically. On the other hand the slip was received by the mainly French audience with real satisfaction and its effect was exactly as though it had been an intentional play upon words. I myself followed this seemingly innocent occurrence with real inner excitement. For although I had for obvious reasons to forgo asking the professor the questions prompted by the psycho-analytic method, I nevertheless took his slip of the tongue as conclusive evidence of the correctness of your theory about the determining of parapraxes and the deep-lying analogies and connections between slips of the tongue and jokes.'

(30) The following slip of the tongue, which was reported by an Austrian officer, Lieutenant T., on his return home, also had its origin among the melancholy impressions of war-time:

'For several months of the time that I was a prisoner-of-war in Italy I was one of two hundred officers accommodated in a small villa. During this time one of our number died of influenza. The impression made by this event was naturally a deep one, for the circumstances in which we found ourselves, the lack of medical assistance and the helplessness of our condition at the time made it more than probable that an epidemic would break out. - We had laid out the dead man in a cellar-room. In the evening, after I had taken a walk around our house with a friend, we both expressed a wish to see the dead body. The sight which greeted me on entering the cellar (I was the one in front) startled me violently, for I had not expected to find the bier so near the entrance and to be confronted at such close quarters with a face transformed by the play of the candle light into something set in movement. While the effects of this scene were still on us we continued our walk around the house. When we came to a place from where there was a view of the park bathed in the light of a full moon, a brightly-lit meadow and beyond it a thin veil of mist, I described the picture that it conjured up; it was as if I saw a ring of elves dancing under the fringe of the neighbouring pine trees.

'The next afternoon we buried our dead comrade. The course of our walk from our prison to the cemetery of the small neighbouring village was both bitter and humiliating for us; for a mocking, jeering crowd made up of shouting half-grown lads and rough, noisy villagers took advantage of the occasion to give open vent to their emotions, which were a mixture of curiosity and hatred. My feeling that even in this defenceless condition we could not escape insults and my disgust at the demonstration of coarseness overwhelmed me with bitterness until the evening. At the same hour as on the previous day and with the same companion, I began to walk along the gravel path around our house, just as I had done before; and as we passed by the grating of the cellar behind which the dead body had lain I was seized by the memory of the impression which the sight of it had made on me. At the place where the brightly lit park once more lay before me, in the light of the same, full moon, I stopped and said to my companion: "We could sit down here in the *grave* - grass and *sink* a serenade." My attention was not caught until I made the second slip; I had corrected the first one without having become conscious of the meaning it contained. I now reflected on them and put them together: "in the grave - to sink!" The following pictures flashed through my mind with lightning rapidity: elves dancing and hovering in the moonlight; our comrade lying on his bier, the impression of movement; some scenes from the burial, the sensation of the disgust I had felt and of the disturbance of our mourning; the memory of some conversations about the infectious illness that had appeared, and the forebodings expressed by several of the officers. Later I remembered that it was the date of my father's death; in view of my usually very poor memory for dates I found this striking.

'Subsequent reflection brought home to me the sameness of the external circumstances on the two evenings: the same time of day and lighting conditions, the identical place and companion. I recalled my uneasy feelings when there had been an anxious discussion of the possibility of the influenza spreading; and I remembered at the same time my inner prohibition against letting myself be overcome by fear. I also became conscious of the significance attaching to the order of the words "we could - in the grave - sink",¹ and I realized that only the initial correction of "grave" into "grass", which had taken place unobtrusively, had led to the second slip ("sink" for "sing") in order to ensure that the suppressed complex should have its full expression.

'I may add that I suffered at the time from alarming dreams about a very close relative. I repeatedly saw her ill and once actually dead. Just before I was taken prisoner I had received news that the influenza was raging with particular virulence in her part of the world, and I had expressed my lively fears to her about it. Since then I had been out of touch with her. Some months later I received news that she had fallen a victim to the epidemic a fortnight before the episode I have described!'

(31) The next example of a slip of the tongue throws a flash of light on one of those painful conflicts which fall to the lot of a doctor. A man whose illness was in all probability a fatal one, though the diagnosis had not as yet been confirmed, had come to Vienna to await the solution of his problem, and had begged a friend whom he had known since his youth, and who had become a well-known physician, to undertake his treatment. This the friend had with some reluctance finally agreed to do. It was intended that the sick man should stay in a nursing home and the doctor proposed that it should be the 'Hera' sanatorium. 'Surely', objected the patient, 'that is a home for a special type of case only (a maternity home).' 'Oh no!' replied the doctor hastily, 'in the "Hera" they can *umbringen* - I mean, *unterbringen* - every type of patient.' He then violently disputed the interpretation of his slip. 'Surely you won't believe I have hostile impulses against you?' A quarter of an hour later, as the doctor was going out with the lady who had undertaken to nurse the invalid, he said: 'I can't find anything, and I still don't believe in it. But if it should be so, I am in favour of a strong dose of morphia and a peaceful finish.' It emerged that his friend had stipulated that he (the doctor) should shorten his sufferings by means of a drug as soon as it was confirmed that he was past helping. Thus the doctor had in fact undertaken to put an end to his friend.

¹ ['*Wir könnten ins Grab sinken*' - 'we could sink in the grave'. The order of the words, on which the present point turns, is different in English and in German.]

(32) Here is a quite especially instructive slip of the tongue which I should not like to omit, although according to my authority it is some twenty years old. 'A lady once advanced the following opinion at a social gathering - and the words show that they were uttered with fervour and under the pressure of a host of secret impulses: "Yes, a woman must be pretty if she is to please men. A man is much better off; as long as he has his *five* straight limbs he needs nothing more!" This example allows us a good view of the intimate mechanism of a slip of the tongue that results from *condensation* or from a *contamination* (cf. p. 1144). It is plausible to suppose that we have here a fusion of two turns of phrase with similar meanings:

as long as he has his *four straight limbs*
as long as he has his *five wits* about him.

Or the element *straight* ['*gerade*'] may have been common to two intended expressions which ran:

as long as he has his *straight* limbs
to treat all *five(s)* as *even numbers*¹

'There is nothing in fact to prevent us from assuming that *both* turns of phrase, the one about his five wits and the one about 'the even number five', played their separate parts in causing first a number, and then the mysterious five instead of the simple four, to be introduced into the sentence dealing with the straight limbs. But this fusion would certainly not have come about if, in the form that appeared in the slip of the tongue, it had not had a good meaning of its own - one expressing a cynical truth which could not of course be admitted to undisguised, coming as it did from a woman. - Finally we should not omit to draw attention to the fact that the lady's remark, as worded, could pass just as well for a capital joke as for an amusing slip of the tongue. It is simply a question of whether she spoke the words with a conscious or an unconscious intention. In our case the way the speaker behaved certainly ruled out any notion of conscious intention and excluded the idea of its being a joke.'

¹ ['*Alle fünf gerade sein lassen.*' The German '*gerade*' means both 'straight and 'even'. The meaning of the phrase, literally translated in the text, is: 'To close one's eyes to irregularities.']

How closely a slip of the tongue can approximate to a joke is shown in the following case, reported by Rank (1913), in which the woman responsible for the slip actually ended by herself treating it as a joke and laughing at it.

(33) 'A recently married man, whose wife was concerned about preserving her girlish appearance and only with reluctance allowed him to have frequent sexual intercourse, told me the following story which in retrospect both he and his wife found extremely funny. After a night in which he had once again disobeyed his wife's rule of abstinence, he was shaving in the morning in the bedroom which they shared, while his wife was still in bed; and, as he had often done to save trouble, he made use of his wife's powder-puff which was lying on the bedside table. His wife, who was extremely concerned about her complexion, had several times told him not to, and therefore called out angrily: "There you go again, powdering *me* with *your* puff!" Her husband's laughter drew her attention to her slip (she had meant to say: "you are powdering *yourself* again with *my* puff") and she herself ended by joining in his laughter. "To powder" is an expression familiar to every Viennese for "to copulate"; and a powder-puff is an obvious phallic symbol.'

(34) In the following example, too - supplied by Storfer - it might be thought that a joke was intended: Frau B., who was suffering from an affection of obviously psychogenic origin, was repeatedly recommended to consult a psycho-analyst, Dr. X. She persistently declined to do so, saying that such treatment could never be of any value, as the doctor would wrongly trace everything back to sexual things. A day finally came, however, when she was ready to follow the advice, and she asked: 'Nun gut, wann *ordinärt* also dieser Dr. X.?'¹

(35) The connection between jokes and slips of the tongue is also shown in the fact that in many cases a slip of the tongue is nothing other than an abbreviation:

On leaving school, a girl had followed the ruling fashion of the time by taking up the study of medicine. After a few terms she had changed over from medicine to chemistry. Some years later she described her change of mind in the following words: 'I was not on the whole squeamish about dissecting, but when I once had to pull the finger-nails off a dead body, I lost my pleasure in the whole of - *chemistry*.'

(36) At this point I insert another slip of the tongue which it needs little skill to interpret. 'In an anatomy lesson the professor was endeavouring to explain the nasal cavities, which are notoriously a very difficult department of enterology. When he asked whether his audience had understood his presentation of the subject, he received a general reply in the affirmative. Whereupon the professor, who was known for his high opinion of himself, commented: 'I can hardly believe that, since, even in Vienna with its millions of inhabitants, those who understand the nasal cavities can be counted on *one finger*, I mean on the fingers of one hand.'

(37) On another occasion the same professor said: 'In the case of the female genitals, in spite of many *Versuchungen* [temptations] - I beg you pardon, *Versuche* [experiments] . . .'

¹ [What she meant to say was: 'All right, then, when does this Dr. X. have his consulting hours?' She should have used the word '*ordiniert*' for 'has his consulting hours'. Instead she said '*ordinärt*', which is a non-existent word. '*Ordinär*', however, means 'common', 'vulgar'.]

(38) I am indebted to Dr. Alfred Robitsek of Vienna for drawing my attention to two slips of the tongue which were recorded by an old French writer. I reproduce them without translating them:

Brantôme (1527-1614), *Vies des Dames galantes*, Discours second: 'Si ay-je cogneu une très-belle et honneste dame de par le monde, qui, devisant avec un honneste gentilhomme de la cour des affaires de la guerre durant ces civiles, elle luy dit: "J'ay ouy dire que le roy a faict rompre tous les c . . . de ce pays là." Elle vouloit dire *les ponts*. Pensez que, venant de coucher d'avec son mary, ou songeant à son amant, elle avoit encor ce nom frais en la bouche; et le gentilhomme s'en eschauffa en amours d'elle pour ce mot.

'Une autre dame que i'ai cogneue, entretenant une autre grand' dame plus qu'elle, et luy louant et exaltant ses beautiez, elle luy dit après: "Non, madame, ce que je vous en dis, ce n'est point pour vous *adultérer*"; voulant dire *adulater* comme elle le rhabilla ainsi: pensez qu'elle songeoit à adultérer.'¹

(39) There are of course more modern examples as well of sexual *doubles entendres* originating in a slip of the tongue. Frau F. was describing her first hour in a language course. 'It is very interesting; the teacher is a nice young Englishman. In the very first hour he gave me to understand "*durch die Bluse*" [through the blouse] - I mean, "*durch die Blume*" [literally, 'through flowers', i.e. 'indirectly'] that he would rather take me for individual tuition.' (From Storfer.)

¹ ['Thus I knew a very beautiful and virtuous lady of the world who, discoursing with a virtuous gentleman on the court on the affairs of the war during those civil disturbances, said to him: "I have heard tell that the king had a breach made in all the c . . . of that region." She meant to say the 'ponts'. One may suppose that, having just lain with her husband, or thinking of her lover, she had this word freshly on her tongue; and the gentleman was fired with love of her on account of this word.

'Another lady whom I knew, entertaining another lady of higher rank than herself, and praising her and extolling her beauties, she said after to her: "No, madame, what I say to you is not in order to *adulterate* you"; meaning to say *adulate*, as she clad the word thus anew, one may suppose that she was thinking of adultery.']

In the psychotherapeutic procedure which I employ for resolving and removing neurotic symptoms I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations, a thought-content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another - that they have put them into a series which implies a recurrence of the same type in their emotional life. To give another example: a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother: he is four years older than I am.' I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. - At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view.

What I find, therefore, both in grosser disturbances of speech and in those more subtle ones which can still be subsumed under the heading of 'slips of the tongue', is that it is not the influence of the 'contact effects of the sounds' but the influence of thoughts that lie outside the intended speech which determines the occurrence of the slip and provides an adequate explanation of the mistake. It is not my wish to throw doubt on the laws governing the way in which sounds modify one another; but by themselves these laws do not seem to me to be sufficiently effective to disturb the process of correct speaking. In the cases that I have studied and explored in some detail these laws represent no more than the preformed mechanism which a more remote psychical motive makes use of for its convenience, though without becoming subject to the sphere of influence of these relations. *In a large number of substitutions resulting from slips of the tongue such phonetic laws are completely disregarded.* In this respect I find myself in full agreement with Wundt, who assumes as I do that the conditions governing slips of the tongue are complex and extend far beyond the contact effects of the sounds.

If I accept these 'remoter psychical influences' (as Wundt calls them) as established, there is nothing, on the other hand, to prevent me at the same time from allowing that, in situations where speaking is hurried and attention is to some extent diverted, the conditions governing slips of the tongue may easily be confined within the limits defined by Meringer and Mayer. For some of the examples collected by these authors a more complicated explanation nevertheless seems more plausible. Take, for instance, one of those quoted above:

'Es war mir auf der *Schwest* . . .
Brust so schwer.'

Was what happened here simply that the sound '*schwe*' forced back the equally valent sound '*bru*' by 'anticipating' it? The idea can hardly be dismissed that the sounds making up '*schwe*' were further enabled to obtrude in this manner because of a special relation. That could only be the association *Schwester* - *Bruder*, perhaps also *Brust der Schwester*, which leads one on to other groups of thoughts. It is this invisible helper behind the scenes which lends the otherwise innocent '*schwe*' the strength to produce a mistake in speaking.

There are other slips of the tongue where we may assume that the true disturbing factor is some similarity in sound to obscene words and meanings. Deliberate distortion and deformation of words and expressions, which is so dear to vulgar minds, has the sole purpose of exploiting innocent occasions for hinting at forbidden topics; and this playing with words is so frequent that there would be nothing remarkable in its occurring even when not intended and against one's wishes. To this category no doubt belong such examples as *Eischeissweibchen* (for *Eiweissweibchen*),¹ *Apopos Fritz* (for *à propos*),² *Lokuskapital* (for *Lotuskapital*),³ etc.; and perhaps also the *Alabüsterbachse* (*Alabasterbüchse*)⁴ of St. Mary Magdalen.⁵ 'Ich fordere Sie auf, auf das Wohl unseres Chefs *auf* zustossen' can hardly be anything other than an unintentional parody which is a perseveration of an intended one. If I were the Principal who was being honoured at the ceremony to which the speaker contributed this slip, I should probably reflect on the cleverness of the Romans in permitting the soldiers of a general who was enjoying a Triumph openly to express in the form of satirical songs their inner criticisms of the man who was being honoured. - Meringer relates that he himself once said to someone, who by reason of being the eldest member of the company was addressed familiarly by the honorific title of '*Senex*' or '*altes Senex*': '*Prost, Senex altes!*' He was himself shocked at this mistake (Meringer and Mayer, 1895, 50). We can perhaps interpret his emotion if we reflect how close '*Altes*' comes to the insulting phrase '*alter Esel*'. There are powerful internal punishments for any breach of the respect due to age (that is, reduced to childhood terms, of the respect due to the father).

¹ [A meaningless term (literally: 'egg-shit-female'), for 'small slices of white of egg'.]

² ['*Apopos*' is a non-existent word; but '*Popo*' is the nursery word for 'buttocks'.]

³ [A meaningless word, literally: 'W.C. capital', for 'lotus capital', an architectural term].

⁴ [A non-existent word (though the middle part of it '*Büste*' means 'breast'), for 'alabaster box'.]

⁵ Making slips of the tongue was a symptom of a woman patient of mine which persisted until it was traced back to the childhood joke of replacing '*ruinieren* [ruin]' by '*urinieren* [urinate]'. - [Added 1924:] The temptation to employ the artifice of a slip of the tongue for enabling improper and forbidden words to be freely used forms the basis of Abraham's observations on parapraxes 'with an overcompensating purpose' (Abraham, 1922a). A woman patient was very liable to duplicate the first syllable of proper names by stammering. She changed the name 'Protagoras' to 'Protragoras', shortly after having said 'A-alexander' instead of 'Alexander'. Inquiry revealed that in childhood she had been especially fond of the vulgar joke of repeating the syllables 'a' and 'po' when they occurred at the beginnings of words, a form of amusement which quite commonly leads to stammering in children. ['*A-a*' and '*Popo*' are the German nursery words for 'faeces' and 'buttocks'.] On approaching the name 'Protagoras' she became aware of the risk that she might omit the 'r' in the first syllable and say 'Po-potagoras'. As a protection against this danger she held on firmly to this 'r', and inserted another 'r' in the second syllable. She acted in the same way on other occasions, distorting the words '*Parterre* [ground floor]' and '*Kondolenz* [condolence]' so as to avoid '*Pater* (father)' and '*Kondom* [condom]' which were closely linked to them in her associations. Another of Abraham's patients confessed to an inclination to say 'Angora' every time for 'angina' - very probably because of a fear of being tempted to replace 'angina' by 'vagina'. These slips of the tongue owed their existence therefore to the fact that a defensive trend had retained the upper hand instead of the distorting one; and Abraham justly draws attention to the analogy between this process and the formation of symptoms in obsessional neurosis.

I hope that readers will not overlook the difference in value between these interpretations, of which no proof is possible, and the examples that I have myself collected and explained by means of an analysis. But if I still secretly cling to my expectation that even apparently simple slips of the tongue could be traced to interference by a half-suppressed idea that lies outside the intended context, I am tempted to do so by an observation of Meringer's which is highly deserving of attention. This author says that it is a curious fact that no one is ready to admit having made a slip of the tongue. There are some very sensible and honest people who are offended if they are told they have made one. I would not venture to put it so generally as does Meringer in saying 'no one'. But the trace of affect which follows the revelation of the slip, and which is clearly in the nature of shame, has a definite significance. It may be compared to the annoyance we feel when we cannot recall a forgotten name, and to our surprise at the tenacity of an apparently indifferent memory; and it invariably indicates that some motive has contributed to the occurrence of the interference.

The twisting round of a name when it is intentional amounts to an insult; and it might well have the same significance in a whole number of cases where it appears in the form of an unintentional slip of the tongue. The person who, as Mayer reports, said 'Freuder' on one occasion instead of 'Freud' because he had shortly before mentioned Breuer's name (Meringer and Mayer, 1895, 38), and who another time spoke of the 'Freuer-Breudian' method of treatment (*ibid.*, 28), was probably a professional colleague - and one who was not particularly enthusiastic about that method. In the chapter below on slips of the pen I shall report an instance of the distortion of a name which certainly cannot be explained in any other way.¹

In these cases the disturbing factor which intervenes is a criticism which has to be set aside since at the moment it does not correspond to the speaker's intention.

¹ [Footnote added 1907:] It can in fact be observed that members of the aristocracy in particular are prone to distort the names of the doctors they consult. We may conclude from this that inwardly they despise them, in spite of the courtesy they habitually show them. - [Added 1912:] I quote here some pertinent observations on the forgetting of names which comes from an account of our subject written in English by Dr Ernest Jones, at that time in Toronto (Jones, 1911b):

'Few people can avoid feeling a twinge of resentment when they find that their name has been forgotten, particularly if it is by some one with whom they had hoped or expected it would be remembered. They instinctively realize that if they had made a greater impression on the person's mind he would certainly have remembered them again, for the name is an integral part of the personality. Similarly, few things are more flattering to most people than to find themselves addressed by name by a great personage where they could hardly have anticipated it. Napoleon, like most leaders of men, was a master of this art. In the midst of the disastrous Campaign of France, in 1814, he gave an amazing proof of his memory in this direction. When in a town near Craonne he recollected that he had met the mayor, De Bussy, over twenty years ago in the La Fère regiment; the delighted De Bussy at once threw himself into his service with extraordinary zeal. Conversely there is no surer way of affronting some one than by pretending to forget his name; the insinuation is thus conveyed that the person is so unimportant in our eyes that we cannot be bothered to remember his name. This device is often exploited in literature. In Turgenev's *Smoke* the following passage occurs. "'So you still find Baden entertaining, M'sieu-Litvinov.' Ratmirov always uttered Litvinov's surname with hesitation, every time, as though he had forgotten it, and could not at once recall it. In this way, as well as by the lofty flourish of his hat in saluting him, he meant to insult his pride." The same author in his *Fathers and Sons* writes: "The Governor invited Kirsanov and Bazarov to his ball, and within a few minutes invited them a second time, regarding them as brothers, and calling them Kisarov." Here the forgetting that he had spoken to them, the mistake in the names, and the inability to distinguish between the two young men, constitute a culmination of disparagement. Falsification of a name has the same significance as forgetting it; it is only a step towards complete amnesia.'

Conversely, replacing one name by another, assuming some one else's name, identification by means of a slip over a name, must signify an appreciative feeling which has for some reason to remain in the background for the time being . An experience of this kind from his schooldays is described by Sándor Ferenczi:

‘When I was in the first form at the *Gymnasium* I had, for the first time in my life, to recite a poem in public (i.e. in front of the whole class). I was well prepared and was dismayed at being interrupted at the very start by a burst of laughter. The teacher subsequently told me why I had met with this strange reception. I gave the title of the poem "Aus der Ferne " quite correctly, but instead of attributing it to its real author I gave my own name. The poet's name is Alexander (Sándor) Petöfi. The exchange of names was helped by our having the same first name; but the real cause was undoubtedly the fact that at that time I identified myself in my secret wishes with the celebrated hero-poet. Even consciously my love and admiration for him bordered on idolatry. The whole wretched ambition-complex is of course to be found as well behind this parapraxis.’

A similar identification by means of an exchange of names was reported to me by a young doctor. He had timidly and reverently introduced himself to the famous Virchow as ‘Dr. Virchow’. The professor turned to him in surprise and asked: ‘Ah! is your name Virchow too?’ I do not know how the ambitious young man justified the slip of the tongue he had made - whether he relied upon the flattering excuse that he felt himself so small beside the great name that his own could not fail to slip away from him, or whether he had the courage to admit that he hoped one day to become as great a man as Virchow, and to beg the Professor not to treat him so contemptuously on that account. One of these two thoughts - or perhaps both of them simultaneously - may have confused the young man while he was introducing himself.

From motives of an extremely personal nature I must leave it open whether a similar interpretation is applicable to the following case as well. At the International Congress at Amsterdam in 1907 my theory of hysteria was the subject of lively discussion. In a diatribe against me one of my most vigorous opponents repeatedly made slips of the tongue which took the form of putting himself in my place and speaking in my name. For example, he said: 'It is well known that Breuer and I have proved . . .' where he could only have meant ' . . . Breuer and *Freud* . . .' My opponent's name bears not the least resemblance to my own. This example, together with many other cases where a slip of the tongue results in one name replacing another, may serve to remind us that such slips can entirely dispense with the assistance afforded by similarity in sound and can come about with no more support than is provided by hidden factors in the subject-matter.

In other, far more significant, cases it is self-criticism, internal opposition to one's own utterance, that obliges one to make a slip of the tongue and even to substitute the opposite of what one had intended. One then observes in astonishment how the wording of an assertion cancels out its own intention, and how the slip has exposed an inner insincerity.¹ The slip of the tongue here becomes a mode of mimetic expression - often, indeed, for the expression of something one did not wish to say: it becomes a mode of self-betrayal. This was the case, for instance, when a man who did not care for what is called normal sexual intercourse in his relations with women broke into a conversation about a girl who was said to be a flirt, with the words: 'If she had to do with me, she'd soon give up her *koëtieren*.' There is no doubt that it can only have been another word, namely '*koitieren*', whose influence was responsible for making this change in the word that was intended, '*kokettieren*' [to flirt, coquette]. - Or take the following case: 'We have an uncle who for months past had been very much offended because we never visited him. We took his move to a new house as an occasion for paying him a long overdue visit. He seemed very glad to see us, and as we were leaving he said with much feeling: "I hope from now on I shall see you still *more seldom* than in the past."'

¹ Slips of the tongue of this type are used, for instance, by Anzengruber in his *Der G'wissenswurm* to expose the character of the hypocritical legacy-hunter.

When the linguistic material happens to be favourable, it often causes slips of the tongue to occur which have the positively shattering result of a revelation, or which produce the full comic effect of a joke. - This is the case in the following example observed and reported by Dr. Reitler:

"That smart new hat - I suppose you '*aufgepatzt*' [instead of '*aufgeputzt*' (trimmed)] it yourself?" said one lady in a voice of admiration to another. She could proceed no further with her intended praise; for the criticism she had silently felt that the hat's trimmings were a "*Patzerei*" had been indicated much too clearly by the unfriendly slip of the tongue for any further phrases of conventional admiration to sound convincing.'

The criticism contained in the following example is milder but none the less unambiguous:

'A lady who was visiting an acquaintance became very impatient and weary at her tedious and long-winded conversation. When at last she succeeded in tearing herself away and taking her leave she was detained by a fresh deluge of words from her companion, who had meanwhile accompanied her into the front hall and now forced her, as she was on the very point of departing, to stand at the door and listen once more. At last she interrupted her hostess with the question: "Are you at home in the front hall?" It was not till she saw the other's astonished face that she noticed her slip of the tongue. Weary of being kept standing so long in the front hall she had meant to break off the conversation by asking: "Are you at home in the mornings?", and her slip betrayed her impatience at the further delay.'

The next example, which was witnessed by Dr. Max Graf, is a warning that one should keep a watch on oneself.

'At the General Meeting of the "Concordia", the Society of Journalists, a young member who was invariably hard-up made a violently aggressive speech, and in his excitement spoke of the "*Vorschussmitglieder*" (instead of "*Vorstandsmitglieder*" or "*Ausschussmitglieder*"). The latter have the authority to sanction loans, and the young speaker had in fact put in an application for a loan.'

We have seen from the example of '*vorschwein*' that a slip of the tongue can easily occur if an effort has been made to suppress insulting words. In this way one gives vent to one's feelings:

A photographer who had made a resolution to refrain from zoological terms in dealing with his clumsy employees, addressed an apprentice - who tried to empty out a large dish that was full to the brim and in doing so naturally spilt half the contents on the floor - in the following words: 'But, man, *schöpsen sie*¹ some of it off first.' And soon after this, in the course of a tirade against a female assistant who had nearly spoilt a dozen valuable plates by her carelessness, he said: 'Are you so *hornverbrannt*. . . ?'²

¹ [He meant to say 'draw', which would have been '*schöpfen Sie*'. Instead he used '*schöpsen Sie*', which is meaningless. The word '*Schöps*', however, means 'sheep' or 'silly fellow'.]

² [Here he meant to say '*hirnverbrannt*', 'idiotic', literally 'with your brain (*Hirn*) burnt up'. The word he used instead, a non-existent term, would mean 'with your horn (*Horn*) burnt up'. The word '*Hornvieh*', literally 'horned cattle', is used in the sense of 'fool'.]

The next example shows how a slip of the tongue resulted in a serious self-betrayal. Certain details in it justify its repetition in full from the account given by Brill in the *Zentralblatt für Psychoanalyse*, Volume II.¹

'I went for a walk one evening with Dr. Frink, and we discussed some of the business of the New York Psychoanalytic Society. We met a colleague, Dr. R., whom I had not seen for years and of whose private life I knew nothing. We were very pleased to meet again, and on my invitation he accompanied us to a café, where we spent two hours in lively conversation. He seemed to know some details about me, for after the usual greetings he asked after my small child and told me that he heard about me from time to time from a mutual friend and had been interested in my work ever since he had read about it in the medical press. To my question as to whether he was married he gave a negative answer, and added: "Why should a man like me marry?"

'On leaving the café, he suddenly turned to me and said: "I should like to know what you would do in a case like this: I know a nurse who was named as co-respondent in a divorce case. The wife sued the husband and named her as co-respondent, and *he* got the divorce." I interrupted him, saying: "You mean *she* got the divorce." He immediately corrected himself saying: "Yes, of course, *she* got the divorce", and continued to tell how the nurse had been so affected by the divorce proceedings and the scandal that she had taken to drink, had become very nervous, and so on; and he wanted me to advise him how to treat her.

¹ In the *Zentralblatt* the paper was ascribed in error to Ernest Jones.

'As soon as I had corrected his mistake I asked him to explain it, but I received the usual surprised answers: had not everyone a right to make a slip of the tongue? it was only an accident there was nothing behind it, and so on. I replied that there must be a reason for every mistake in speaking, and that, had he not told me earlier that he was unmarried, I would be tempted to suppose he himself was the hero of the story; for in that case the slip could be explained by his wish that he had obtained the divorce rather than his wife, so that he should not have (by our matrimonial laws) to pay alimony, and so that he could marry again in New York State. He stoutly denied my conjecture, but the exaggerated emotional reaction which accompanied it, in which he showed marked signs of agitation followed by laughter, only strengthened my suspicions. To my appeal that he should tell the truth in the interests of science, he answered: "Unless you wish me to lie you must believe that I was never married, and hence your psycho-analytic interpretation is all wrong." He added that someone who paid attention to every triviality was positively dangerous. Then he suddenly remembered that he had another appointment and left us.

'Both Dr. Frink and I were still convinced that my interpretation of his slip of the tongue was correct, and I decided to corroborate or disprove it by further investigation. Some days later I visited a neighbour, an old friend of Dr. R., who was able to confirm my explanation in every particular. The divorce proceedings had taken place some weeks before, and the nurse was cited as co-respondent. Dr. R. is to-day thoroughly convinced of the correctness of the Freudian mechanisms.'

The self-betrayal is equally unmistakable in the following case, reported by Otto Rank:

'A father who was without any patriotic feelings, and who wished to educate his children so that they too should be free from what he regarded as a superfluous sentiment, was criticizing his sons for taking part in a patriotic demonstration; when they protested that their uncle had also taken part in it, he replied: "*He* is the one person you should not imitate: he is an *idiot*." On seeing his children's look of astonishment at their father's unusual tone, he realized that he had made a slip of the tongue, and added apologetically: "I meant to say '*patriot*', of course."

Here is a slip of the tongue which was interpreted as a self-betrayal by the other party to the conversation. It is reported by Stärcke, who adds a pertinent comment, though it goes beyond the task of interpreting the slip.

'A woman dentist promised her sister that she would have a look some time to see if there was *Kontakt* between two of her molars (that is, to see if the lateral surfaces of the molars were touching each other so that no fragments of food could lodge in between). Her sister finally complained about having to wait so long for this inspection, and jokingly said: "She's probably treating a colleague at the moment, but her sister has to go on waiting." The dentist eventually examined her, found there was in fact a small cavity in one of the molars, and said: "I didn't think it was in such a bad way - I thought it was merely that you had no *Kontant* - I mean *Kontakt*." "You see?" laughed her sister; "your greed is the only reason why you made me wait so much longer than your paying patients!"

'(Obviously I should not add my own associations to hers or base any conclusions on them, but when I heard of this slip of the tongue it at once sprang to my mind that these two pleasant and gifted young ladies are unmarried and have in fact very little to do with young men, and I asked myself whether they would have more *contact* with young people if they had more *ready money*.)'

In the following example, too, reported by Reik (1915), the slip of the tongue amounts to a self-betrayal:

'A girl was to become engaged to a young man whom she did not care for. To bring the two young people closer together, their parents arranged a meeting which was attended by the parties to the intended match. The young girl possessed sufficient self-control to prevent her suitor, who behaved in a very on-coming manner towards her, from detecting her antipathy to him. But when her mother asked her how she liked the young man, she answered politely: "Well enough. He's most *liebenswidrig*!"'¹

¹ [She intended to say '*liebenswertig*', 'agreeable' (literally 'worthy of love'). The word she actually used, '*liebenswidrig*', would mean literally 'repelling to love'.]

Equally self-revealing is the following, which Rank (1913) describes as a 'witty slip of the tongue'.

'A married woman, who enjoyed hearing anecdotes and who was said not to be altogether averse to extra-marital affairs if they were reinforced by adequate gifts, was told the following time-honoured story, not without design on his part, by a young man who was eager to obtain her favours. One of two business friends was trying to obtain the favours of his partner's somewhat prudish wife. In the end she consented to grant them to him in exchange for a present of a thousand gulden. When, therefore, her husband was about to start on a journey, his partner borrowed a thousand gulden from him and promised to pay them back next day to his wife. He then, of course, paid the sum to the wife, implying that it was the reward for her favours; and she supposed she had been caught at last when her husband on his return asked for the thousand gulden and thus found insult added to injury. When the young man reached the point in his story at which the seducer says: "I'll *repay* the money to your wife tomorrow", his listener interrupted with the highly revealing words: "Let me see, haven't you *repaid* me that - I'm sorry - I mean *told* me that already?" She could hardly have given a clearer indication, without actually putting it into words, of her willingness to offer herself on the same terms.'

A good example of this kind of self-betrayal, which did not lead to serious consequences, is reported by Tausk (1917) under the title of 'The Faith of our Fathers'. 'As my fiancée was a Christian', Herr A. related, 'and was unwilling to adopt the Jewish faith, I myself was obliged to be converted from Judaism to Christianity so that we could marry. I did not change my religion without some internal resistance, but I felt it was justified by the purpose behind it, the more so because it involved abandoning no more than an outward adherence to Judaism, not a religious conviction (which I had never had). Notwithstanding this, I always continued later on to acknowledge the fact of my being a Jew, and few of my acquaintances know I am baptized. I have two sons by this marriage, who were given Christian baptism. When the boys were sufficiently old they were told of their Jewish background, so as to prevent them from being influenced by anti-semitic views at their school and from turning against their father for such a superfluous reason. Some years ago I and my children, who were then at their primary school, were staying with the family of a teacher at the summer resort in D. One day while we were sitting at tea with our otherwise friendly hosts, the lady of the house, who had no inkling of her summer guests' Jewish ancestry, launched some very sharp attacks on the Jews. I ought to have made a bold declaration of the facts in order to set my sons the example of "having the courage of one's convictions", but I was afraid of the unpleasant exchanges that usually follow an avowal of this sort. Besides, I was alarmed at the possibility of having to leave the good lodgings we had found and of thus spoiling my own and my children's in any case limited holiday period, should our hosts' behaviour towards us take an unfriendly turn because of the fact that we were Jews. As however I had reason to expect that my sons, in their candid and ingenuous way, would betray the momentous truth if they heard any more of the conversation, I tried to get them to leave the company by sending them into the garden. I said: "Go into the garden, *Juden* ", quickly correcting it to "*Jungen* ". In this way I enabled the "courage of my convictions" to be expressed in a parapraxis. The others did not in fact draw any conclusions from my slip of the tongue, since they attached no significance to it; but I was obliged to learn the lesson that the "faith of our fathers" cannot be disavowed with impunity if one is a son and has sons of one's own.'

The effect produced by the following slip of the tongue, which I would not report had not the magistrate himself made a note of it for this collection during the court proceedings, is anything but innocent:

A soldier charged with housebreaking stated in evidence: 'Up to now I've not been discharged from military *Diebstellung*;¹ so at the moment I'm still in the army.'

¹ [He meant to say '*Dienststellung*', 'service', literally 'service position'. Instead he said '*Diebstellung*', which would mean literally 'thief position'.]

A slip of the tongue has a more cheering effect during psycho-analytic work, when it serves as a means of providing the doctor with a confirmation that may be very welcome to him if he is engaged in a dispute with the patient. I once had to interpret a patient's dream in which the name 'Jauner' occurred. The dreamer knew someone of that name, but it was impossible to discover the reason for his appearing in the context of the dream; I therefore ventured to suggest that it might be merely because of his name, which sounds like the term of abuse '*Gauner*'. My patient hastily and vigorously contested this; but in doing so he made a slip of the tongue which confirmed my guess, since he confused the same letters once more. His answer was: 'That seems to me too *jewagt*.'¹ When I had drawn his attention to his slip, he accepted my interpretation.

If one of the parties involved in a serious argument makes a slip of the tongue which reverses the meaning of what he intended to say, it immediately puts him at a disadvantage with his opponent, who seldom fails to make the most of his improved position.

This makes it clear that people give slips of the tongue and other parapraxes the same interpretation that I advocate in this book, even if they do not endorse theoretically the view I put forward, and even if they are disinclined, so far as it applies to themselves, to renounce the convenience that goes along with tolerating parapraxes. The amusement and derision which such oral slips are certain to evoke at the crucial moment can be taken as evidence against what purports to be the generally accepted convention that a mistake in speaking is a *lapsus linguae* and of no psychological significance. It was no less a person than the German Imperial Chancellor Prince Bülow who protested on these lines in an effort to save the situation, when the wording of his speech in defence of his Emperor (in November, 1907) was given the opposite meaning by a slip of the tongue. 'As for the present, the new epoch of the Emperor Wilhelm II, I can only repeat what I said a year ago, namely that *it would be unfair and unjust to speak of a coterie of responsible advisors round our Emperor . . .*' (loud cries of 'irresponsible') '*. . . irresponsible advisors. Forgive the lapsus linguae.*' (Laughter.)

¹ [In vulgar speech, particularly in North Germany, 'g' at the beginning of a word is often pronounced like the German 'i' (English 'y') instead of like the hard English 'g'.]

In this case, as a result of the accumulation of negatives, Prince Bülow's sentence was somewhat obscure; sympathy for the speaker and consideration for his difficult position prevented this slip from being put to any further use against him. A year later another speaker in the same place was not so fortunate. He wished to appeal for a demonstration *with no reserves* in support of the Emperor, and in doing so was warned by a bad slip of the tongue that other emotions were to be found within his loyal breast. 'Lattmann (German National Party): On the question of the Address our position is based on the standing orders of the Reichstag. According to them the Reichstag is entitled to tender such an address to the Emperor. It is our belief that the united thoughts and wishes of the German people are bent on achieving a *united demonstration* in this matter as well, and if we can do so in a form that takes the Emperor's feelings fully into account, then we should do so *spinelessly* as well.' (Loud laughter which continued for some minutes.) 'Gentlemen, I should have said not "*rückgratlos*" but "*rückhaltlos*"' (laughter), 'and at this difficult time even our Emperor accepts a manifestation by the people - one made without reserve - such as we should like to see.'

The *Vorwärts* of November 12, 1908, did not miss the opportunity of pointing to the psychological significance of this slip of the tongue: 'Probably never before in any parliament has a member, through an involuntary self-accusation, characterized his own attitude and that of the parliamentary majority towards the Emperor so exactly as did the anti-Semitic Lattmann, when, speaking with solemn emotion on the second day of the debate, he slipped into an admission that he and his friends wished to express their opinion to the Emperor *spinelessly*. Loud laughter from all sides drowned the remaining words of this unhappy man, who thought it necessary explicitly to stammer out by way of apology that he really meant "*unreservedly*".'

I will add a further instance, in which the slip of the tongue assumed the positively uncanny characteristics of a prophecy. Early in 1923 there was a great stir in the world of finance when the very young banker X. - probably one of the newest of the '*nouveaux riches*' in W., and at any rate the richest and youngest - obtained possession, after a short struggle, of a majority of the shares of the -- Bank; and as a further consequence, a remarkable General Meeting took place at which the old directors of the bank, financiers of the old type, were not re-elected, and young X. became president of the bank. In the valedictory speech which the managing director Dr. Y. went on to deliver in honour of the old president, who had not been re-elected, a number of the audience noticed a distressing slip of the tongue which occurred again and again. He continually spoke of the *expiring* president instead of the *outgoing* president. As it turned out, the old president who was not re-elected died a few days after this meeting. He was, however, over eighty years old! (From Storfer.)

A good example of a slip of the tongue whose purpose is not so much to betray the speaker as to give the listener in the theatre his bearings, is to be found in *Wallenstein (Piccolomini, Act I, Scene 5)*; and it shows us that the dramatist, who here availed himself of this device, was familiar with the mechanism and meaning of slips of the tongue. In the preceding scene Max Piccolomini has ardently espoused the Duke's cause, and has been passionately describing the blessings of peace, of which he has become aware on the course of a journey while escorting Wallenstein's daughter to the camp. As he leaves the stage, his father and Questenberg, the emissary from the court, are plunged in consternation. Scene 5 continues:

QUESTENBERG Alas, alas! and stands it so?
 What friend! and do we let him go away
 In this delusion - let him go away?
 Not call him back immediately, not open
 His eyes upon the spot?

OCTAVIO (*recovering himself out of a deep study*)
 He has now open'd mine,
 And I see more than pleases me.

QUEST. What is it?

OCT. Curse on this journey!

QUEST. But why so? What is it?

OCT. Come, come along, friend! I must follow up
 The ominous track immediately. Mine eyes
 Are open'd now, and I must use them. Come!
 (*Draws Q. on with him*)

QUEST What now? *Where* go you then?

OCT. To her herself.

QUEST. To -

OCT. (*correcting himself*) To the Duke. Come let us go.

The small slip of saying 'to her' instead of 'to him' is meant to reveal to us that the father has seen through his son's motive for espousing the Duke's cause, while the courtier complains that he is 'talking absolute riddles' to him.

Another example in which a dramatist makes use of a slip of the tongue has been discovered by Otto Rank (1910) in Shakespeare. I quote Rank's account:

'A slip of the tongue occurs in Shakespeare's *Merchant of Venice* (Act III, Scene 2), which is from the dramatic point of view extremely subtly motivated and which is put to brilliant technical use. Like the slip in *Wallenstein* to which Freud has drawn attention, it shows that dramatists have a clear understanding of the mechanism and meaning of this kind of parapraxis and assume that the same is true of their audience. Portia, who by her father's will has been bound to the choice of a husband by lot, has so far escaped all her unwelcome suitors by a fortunate chance. Having at last found in Bassanio the suitor who is to her liking, she has cause to fear that he too will choose the wrong casket. She would very much like to tell him that even so he could rest assured of her love; but she is prevented by her vow. In this internal conflict the poet makes her say to the suitor she favours:

I pray you tarry; pause a day or two,
Before you hazard: for, in choosing wrong,
I lose your company; therefore, forbear a while:
There's something tells me (*but it is not love*)
I would not lose you . . .

. . . I could teach you
How to choose right, but then I am forsworn;
So will I never be; so may you miss me;
But if you do you'll make me wish a sin,
That I have been forsworn. Beshrew your eyes,
They have o'erlooked me, and divided me;
One half of me is yours, the other half yours, -
Mine own, I would say, but if mine, then yours,
And so all yours.

'The thing of which she wanted to give him only a very subtle hint, because she should really have concealed it from him altogether, namely, that even before he made his choice she was *wholly* his and loved him - it is precisely this that the poet, with a wonderful psychological sensitivity, causes to break through openly in her slip of the tongue; and by this artistic device he succeeds in relieving both the lover's unbearable uncertainty and the suspense of the sympathetic audience over the outcome of his choice.

In view of the interest that is lent to our theory of slips of the tongue by support of this nature from great writers, I feel justified in citing a third such instance which has been reported by Ernest Jones (1911*b*, 496):

'In a recently published article Otto Rank drew our attention to a pretty instance of how Shakespeare caused one of his characters, Portia, to make a slip of the tongue which revealed her secret thoughts to an attentive member of the audience. I propose to relate a similar example from *The Egoist*, the masterpiece of the greatest English novelist, George Meredith. The plot of the novel is, shortly, as follows: Sir Willoughby Patterne, an aristocrat greatly admired by his circle, becomes engaged to a Miss Constantia Durham. She discovers in him an intense egoism, which he skilfully conceals from the world, and to escape the marriage she elopes with a Captain Oxford. Some years later Patterne becomes engaged to a Miss Clara Middleton, and most of the book is taken up with a detailed description of the conflict that arises in her mind on also discovering his egoism. External circumstances, and her conception of honour, hold her to her pledge, while he becomes more and more distasteful in her eyes. She partly confides in his cousin and secretary, Vernon Whitford, the man whom she ultimately marries; but from loyalty to Patterne and other motives he stands aloof.

'In a soliloquy about her sorrow Clara speaks as follows: "If some noble gentleman could see me as I am and not disdain to aid me! Oh! to be caught out of this prison of thorns and brambles. I cannot tear my own way out. I am a coward. A beckoning of a finger would change me, I believe. I could fly bleeding and through hootings to a comrade . . . Constantia met a soldier. Perhaps she prayed and her prayer was answered. She did ill. But, oh, how I love her for it! His name was Harry Oxford . . . She did not waver, she cut the links, she signed herself over. Oh, brave girl, what do you think of me? But I have no Harry Whitford; I am alone . . .' The sudden consciousness that she had put another name for Oxford struck her a buffet, drowning her in crimson."

'The fact that both men's names end in "ford" evidently renders the confounding of them more easy, and would by many be regarded as an adequate cause for this, but the real underlying motive for it is plainly indicated by the author. In another passage the same *lapsus* occurs, and is followed by the spontaneous hesitation and sudden change of subject that one is familiar with in psycho-analysis and in Jung's association experiments when a half-conscious complex is touched. Sir Willoughby patronisingly says of Whitford: "False alarm. The resolution to do anything unaccustomed is quite beyond poor old Vernon." Clara replies: "But if Mr Oxford - Whitford, . . . your swans, coming sailing up the lake, how beautiful they look when they are indignant! I was going to ask you, surely men witnessing a marked admiration for someone else will naturally be discouraged?" Sir Willoughby stiffened with sudden enlightenment."

'In still another passage, Clara by another *lapsus* betrays her secret wish that she was on a more intimate footing with Vernon Whitford. Speaking to a boy friend, she says: "Tell Mr. Vernon - tell Mr. Whitford."¹

¹ [Footnote added 1920:] Other instances of slips of the tongue which the writer intends to be taken as having a meaning and usually as being self-revealing can be found in Shakespeare's *Richard II* (Act II, Scene 2), and in Schiller's *Don Carlos* (Act. II, Scene 8; a slip made by Princess Eboli). There would doubtless be no difficulty in extending this list.

The view of slips of the tongue which is advocated here can meet the test even in the most trivial examples. I have repeatedly been able to show that the most insignificant and obvious errors in speaking have their meaning and can be explained in the same way as the more striking instances. A woman patient who was acting entirely against my wishes in planning a short trip to Budapest, but who was determined to have her own way, justified herself by telling me that she was going for only three days; but she made a slip of the tongue and actually said 'only three *weeks*'. She was betraying the fact that, to spite me, she would rather spend three weeks than three days there in the company which I considered unsuitable for her. - One evening I wanted to excuse myself for not having fetched my wife home from the theatre, and said: 'I was at the theatre at ten past ten.' I was corrected: 'You mean ten *to* ten.' Of course I meant ten to ten. *After* ten o'clock would have been no excuse. I had been told that the theatre bills said the performance ended before ten. When I reached the theatre I found the entrance-hall in darkness and the theatre empty. The performance had in fact ended earlier and my wife had not waited for me. When I looked at the clock it was only five to ten. But I decided to make my case out more favourable when I got home and to say it had been ten to ten. Unfortunately, my slip of the tongue spoilt my plan and revealed my disingenuousness, by making me confess more than there was to confess.

This leads on to those speech-disturbances which cannot any longer be described as slips of the tongue because what they affect is not the individual word but the rhythm and execution of a whole speech: disturbances like, for instance, stammering and stuttering caused by embarrassment. But here too, as in the former cases, it is a question of an internal conflict, which is betrayed to us by the disturbance in speech. I really do not think that anyone would make a slip of the tongue in an audience with his Sovereign, in a serious declaration of love or in defending his honour and name before a jury - in short, on all those occasions in which a person is heart and soul engaged. Even in forming an appreciation of an author's style we are permitted and accustomed to apply the same elucidatory principle which we cannot dispense with in tracing the origins of individual mistakes in speech. A clear and unambiguous manner of writing shows us that here the author is at one with himself; where we find a forced and involved expression which (to use an apt phrase) is aimed at more than one target, we may recognize the intervention of an insufficiently worked-out, complicating thought, or we may hear the stifled voice of the author's self-criticism.¹

Since this book first appeared friends and colleagues who speak other languages have begun to turn their attention to slips of the tongue which they have been able to observe in countries where their language is spoken. As was to be expected they have found that the laws governing parapraxes are independent of the linguistic material; and they have made the same interpretations that have been exemplified here in instances coming from speakers of the German language. Of countless examples I include only one:

Brill (1909) reports of himself: 'A friend described to me a nervous patient and wished to know whether I could benefit him. I remarked: "I believe that in time I could remove all his symptoms by psycho-analysis because it is a *durable* case" - wishing to say "*curable*"!'

¹ [Footnote added 1910:]

Ce qu'on conçoit bien
S'annonce clairement
Et les mots pour le dire
Arrivent aisément.

[What is well thought out
Presents itself with clarity,
And the words to express it
Come easily.]

Boileau: *Art poétique*.

In conclusion, for the benefit of readers who are prepared to make a certain effort and to whom psychoanalysis is not unfamiliar, I will add an example which will enable them to form some picture of the mental depths into which the pursuit even of a slip of the tongue can lead. It has been reported by Jekels (1913).

'On December 11, a lady of my acquaintance addressed me (in Polish) in a somewhat challenging and overbearing manner, as follows: "Why did I say to-day that I have twelve fingers?" At my request she gave an account of the scene in which the remark was made. She had got ready to go out with her daughter to pay a visit, and had asked her daughter - a case of dementia praecox then in remission - to change her blouse; and this she in fact did, in the adjoining room. On re-entering, the daughter found her mother busy cleaning her nails, and the following conversation ensued:

'Daughter: "There! I'm ready now and you're not!"

'Mother: "Yes, but you have only one blouse and I have *twelve nails*."

'Daughter: "What?"

'Mother (impatiently): "Well, of course I have; after all, I have *twelve fingers*."

'A colleague who heard the story at the same time as I did asked what occurred to her in connection with *twelve*. She answered equally quickly and definitely: "Twelve means nothing to me - it is not the date of anything (of importance).

'To *finger* she gave the following association after a little hesitation: "Some of my husband's family were born with six fingers on their feet (Polish has no specific word for 'toe'). When our children were born they were immediately examined to see if they had six fingers." For external reasons the analysis was not continued that evening.

'Next morning, December 12, the lady visited me and told me with visible excitement: "What do you suppose has happened? For about the last twenty years I have been sending congratulations to my husband's elderly uncle on his birthday which is to-day, and I have always written him a letter on the 11th. This time I forgot about it and had to send a telegram just now."

'I myself remembered, and I reminded the lady, how positive she had been the evening before in dismissing my colleague's question about the number twelve - which was in fact very well fitted to remind her of the birthday - by remarking that the twelfth was not a date of importance to her.

'She then admitted that this uncle of her husband's was a wealthy man from whom she had in fact always expected to inherit something, quite especially in her present straitened financial circumstances. Thus, for instance, it was he, or rather his death, that had immediately sprung to her mind a few days before when an acquaintance of hers had predicted from cards that she would receive a large sum of money. It flashed through her mind at once that the uncle was the only person from whom money could possibly come to her or her children; and this same scene also instantly reminded her of the fact that this uncle's wife had once promised to remember the lady's children in her will. But in the meanwhile she had died intestate; had she perhaps given her husband appropriate instructions?

'The death-wish against the uncle must clearly have emerged with very great intensity, for she said to the friend who made the prophecy: "You encourage people to make away with others." In the four or five days that elapsed between the prophecy and the uncle's birthday she was constantly looking at the obituary columns in the newspapers from the town where the uncle lived. Not surprisingly, therefore, in view of the intensity of her wish for his death, the event and the date of the birthday he was about to celebrate were so strongly suppressed that not only was a resolution which had been carried out for years forgotten in consequence, but even my colleague's question failed to bring them to consciousness.

'In the slip "twelve fingers" the suppressed "twelve" had broken through and had helped to determine the parapraxis. I say "*helped* to determine", for the striking association to "finger" leads us to suspect the existence of some further motivations. It also explains why the "twelve" had falsified precisely this most innocent phrase, "ten fingers". The association ran: "Some members of my husband's family were born with six fingers on their feet." Six toes are a sign of a particular abnormality. Thus six fingers mean *one* abnormal child and twelve fingers *two* abnormal children. And that was really the fact in this case. The lady had married at a very early age; and the only legacy left her by her husband, a highly eccentric and abnormal person who took his own life shortly after their marriage, were two children whom the doctors repeatedly pronounced to be abnormal and victims of a grave hereditary taint derived from their father. The elder daughter recently returned home after a severe catatonic attack; soon afterwards, the younger daughter, now at the age of puberty, also fell ill from a serious neurosis.

'The fact that the children's abnormality is here linked with the death-wish against the uncle, and is condensed with this far more strongly suppressed and psychically more powerful element, enables us to assume the existence of a second determinant for the slip of the tongue, namely a *death-wish against abnormal children*.

'But the special significance of twelve as a death wish is already indicated by the fact that the uncle's birthday was very intimately associated in the lady's mind with the idea of his death. For her husband had taken his life on the 13th - one day, that is, after the uncle's birthday; and the uncle's wife had said to the young widow: "Yesterday he was sending his congratulations, so full of warmth and kindness - and to-day . . .!"

'I may add that the lady had real enough reasons as well for wishing her children dead; for they brought her no pleasure at all, only grief and severe restrictions on her independence, and she had for their sake renounced all the happiness that love might have brought her. On this occasion she had in fact gone to exceptional lengths to avoid putting the daughter with whom she was going to pay the visit in a bad mood; and it may be imagined what demands this makes on anyone's patience and self-denial where the case is one of dementia praecox, and how many angry impulses have to be suppressed in the process.

'The meaning of the parapraxis would accordingly be:

"The uncle shall die, these abnormal children shall die (the whole of this abnormal family, as it were), and I will get their money."

'This parapraxis bears, in my view, several indications of an unusual structure:

'(a) Two determinants were present in it, condensed in a single element.

'(b) The presence of the two determinants was reflected in the doubling of the slip of the tongue (twelve nails, twelve fingers).

'(c) It is a striking point that one of the meanings of "twelve", viz., the twelve fingers which expressed the children's abnormality, stood for an indirect form of representation; the psychical abnormality was here represented by the physical abnormality, and the highest part of the body by the lowest.'

CHAPTER VI

MISREADINGS AND SLIPS OF THE PEN

When we come to mistakes in reading and writing, we find that our general approach and our observations in regard to mistakes in speaking hold good here too - not surprisingly, in view of the close kinship between these functions. I shall confine myself here to reporting a few carefully analysed examples, and shall make no attempt to cover every aspect of the phenomena.

(A) MISREADINGS

(1) I was sitting in a café, turning over the pages of a copy of the *Leipziger Illustrierte* (which I was holding up at an angle), when I read the following legend under a picture that stretched across the page: 'A Wedding Celebration in the *Odysee*.' It caught my attention; in surprise I took hold of the paper in the proper way and then corrected my error: 'A Wedding Celebration on the *Ostee*.' How did I come to make this absurd mistake in reading? My thoughts at once turned to a book by Ruths (1898), *Experimentaluntersuchungen über Musikphantome* . . . , which had occupied me a good deal recently since it trenches on the psychological problems that I have been concerned with. The author promised that he would shortly be bringing out a book to be called 'Analysis and Principles of Dream Phenomena'. Seeing that I have just published an *Interpretation of Dreams* it is not surprising that I should await this book with the keenest interest. In Ruths' work on music phantoms I found at the beginning of the list of contents an announcement of a detailed inductive proof that the ancient Greek myths and legends have their main source of origin in phantoms of sleep and music, in the phenomena of dreams and also in deliria. Thereupon I at once plunged into the text to find out whether he also realized that the scene in which Odysseus appears before Nausicaä was derived from the common dream of being naked. A friend had drawn my attention to the fine passage in Gottfried Keller's *Der Grüne Heinrich* which explains this episode in the Odyssey as an objective representation of the dreams of a sailor wandering far from home; and I had pointed out the connection with exhibitionist dreams of being naked.¹ I found nothing on the subject in Ruths' book. In this instance it is obvious that my thoughts were occupied with questions of priority.

¹ *The Interpretation of Dreams* (1900a), p. 725-6.

(2) How did I come to read in a newspaper one day: '*Im Fass* across Europe', instead of '*Zu Fuss*'? Solving this problem caused me prolonged difficulties. The first associations, it is true, indicated that it must have been the tub of Diogenes that I had in mind; and I had recently been reading about the art of the age of Alexander in a history of art. From there it was easy to recall Alexander's celebrated remark: 'If I were not Alexander I should like to be Diogenes.' I also had some dim recollection of a certain Hermann Zeitung¹ who had set out on his travels packed in a trunk. But the train of associations declined to run on further, and I did not succeed in rediscovering the page in the history of art on which the remark had caught my eye. It was not till months later that the problem, which I had meanwhile set aside, suddenly sprang to my mind once more; and this time it brought its solution with it. I recalled the comment of a newspaper article on the strange means of *transport* that people were then choosing in order to go to Paris for the International Exhibition; and the passage, I believe, went on with a joking account of now one gentleman intended to get himself rolled in a tub to Paris by another gentleman. Needless to say the only motive of these people would be to draw attention to themselves by such folly. Hermann Zeitung was in fact the name of the man who had provided the first instance of such extraordinary methods of transport. It then struck me that I once treated a patient whose pathological anxiety about reading newspapers was to be explained as a reaction against his pathological *ambition* to see himself in print and to read of his fame in the newspapers. Alexander of Macedon was undoubtedly one of the most ambitious men that ever lived. He even complained that he would find no Homer to sing of his exploits. But how could I possibly have *failed to recall* that there is another Alexander who is closer to me, that Alexander is the name of my younger brother? I now immediately found the objectionable thought about this other Alexander that had had to be repressed, and what it was that had given rise to it at the present time. My brother is an authority on matters connected with tariffs and *transport*, and at a certain date he was due to receive the title of professor for his work in teaching at a commercial college. Several years ago my own name had been suggested at the University for the same *promotion*, without my having obtained it. At the time, our mother expressed her surprise that her younger son was to become a professor before her elder. This had been the situation when I was unable to solve my mistake in reading. Subsequently my brother too met with difficulties; his prospects of becoming professor sank even lower than my own. But at that point the meaning of the misreading suddenly became clear to me; it was as though the fading of my brother's prospects had removed an obstacle. I had behaved as if I was reading of my brother's appointment in the newspaper and was saying to myself: 'How curious that a person can appear in the newspaper (i.e. can be appointed professor) on account of such stupidities (which is what his profession amounts to)!' Afterwards I had no difficulty in finding the passage about Hellenistic art in the age of Alexander, and to my astonishment convinced myself that in my previous search I had repeatedly read parts of the same page and had each time passed over the relevant sentence as if I was under the dominance of a negative hallucination. However, this sentence did not contain anything at all to enlighten me - anything that would have deserved to be forgotten. I suspect that the symptom consisting of my failure to find the passage in the book was only formed with the purpose of leading me astray. I was intended to search for a continuation of the train of thought in the place where my enquiries encountered an obstacle - that is, in some idea connected with Alexander of Macedon; in this way I was to be more effectively diverted from my brother of the same name. In fact the device was entirely successful; all my efforts were directed towards rediscovering the lost passage in the history of art.

In this case the ambiguity of the word '*Beförderung*' forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

¹ ['*Zeitung*', here a proper name, is also the German for 'newspaper'.]

(3) One day I received a letter from the neighbourhood of Vienna which brought me a piece of news that shocked me. I immediately called my wife and broke the news to her that '*die* arme¹ Wilhelm M.' had fallen very seriously ill and been given up by the doctors. There must, however, have been a false ring about the words I chose to express my sorrow, for my wife grew suspicious, asked to see the letter, and declared she was certain it could not read as I had said it did, since no one called a wife by her husband's first name, and in any case the lady who wrote the letter knew the wife's first name perfectly well. I obstinately defended my assertion and referred to the very common use of visiting cards on which a woman styles herself by her husband's first name. I was finally compelled to pick up the letter, and what we in fact read in it was '*der*² arme W. M.', or rather something even plainer: '*der* arme *Dr.* W. M.', which I had entirely overlooked. My mistake in reading therefore amounted to a kind of convulsive attempt to shift the sad news from the husband to the wife. The title that stood between the article, adjective and name did not fit in well with my requirement that the wife should be the one referred to. For this reason it was simply done away with in the process of reading. My motive for falsifying the message was not, however, that my feelings for the wife were less warm than those I had for her husband, but that the poor man's fate had excited my fears for another person in close contact with me. This person shared with him what I knew to be one of the determinants of the illness.

¹ [The use of '*die*', the feminine form of the definite article, implied that the person concerned was a woman.]

² [The masculine form of the definite article.]

(4) There is one misreading which I find irritating and laughable and to which I am prone whenever I walk through the streets of a strange town on my holidays. On these occasions I read every shop sign that resembles the word in any way as 'Antiquities'. This betrays the questing spirit of the collector.

(5) Bleuler relates in his important book, *Affektivität, Suggestibilität, Paranoia* (1906, 121): 'Once while I was reading I had an intellectual feeling that I saw my name two lines further down. To my astonishment I only found the word "*Blutkörperchen*". I have analysed many thousands of misreadings in the peripheral as well as the central visual field; but this is the grossest instance. Whenever I imagined I saw my name, the word that gave rise to the notion usually resembled my name much more, and in most cases every single letter of my name had to be found close together before I could make such an error. In this case, however, the delusion of reference and the illusion could be explained very easily: what I had just read was the end of a comment on a type of bad style found in scientific works, from which I did not feel free.'

(6) Hanns Sachs reports having read: 'The things that strike other people are passed over by him in his "*Steffleinenheit*".' 'This last word', Sachs proceeds, 'surprised me, and on looking more closely I discovered that it was "*Stilfeinheit*". The passage occurred in the course of some remarks by an author whom I admired, which were in extravagant praise of a historian whom I do not find sympathetic because he exhibits the "German professorial manner" in too marked a degree.'

(7) Dr. Marcell Eibenschütz (1911) describes an instance of misreading in the course of his philological studies. 'I was engaged in studying the literary tradition of the *Book of Martyrs*, a Middle High German legendary which I had undertaken to edit in the series of "German Mediaeval Texts" published by the Prussian Akademie der Wissenschaften. Very little was known about the work, which had never seen print. There was a single essay on it in existence, by Joseph Haupt (1872, 101 ff.). Haupt based his work not on an old manuscript but on a copy of the principal source, Manuscript C (Klosterneuburg). This copy had been made at a comparatively recent date (in the nineteenth century). It is preserved in the Hofbibliothek. At the end of the copy the following subscription¹ is to be found:

"Anno Domini MDCCCL in vigilia exaltacionis sancte crucis ceptus est iste liber et in vigilia pasce anni subsequentis finitus cum adiutorio omnipotentis per me Hartmanum de Krasna tunc temporis ecclesie niwenburgensis custodem."²

'Now in his essay Haupt quotes this subscription in the belief that it comes from the writer of C himself, and supposes C to have been written in 1350 - a view involving a consistent misreading of the date 1850 in Roman numerals - in spite of his having copied the subscription perfectly correctly and in spite of its having been printed perfectly correctly (i.e. as MDCCCL) in the essay, in the passage referred to.

¹ [I.e. signature or explanatory paragraph at the end of a document.]

² ['This book was begun on the Eve of Holy Cross Day in the Year of Our Lord 1850, and was finished on Easter Saturday in the following year; it was made, with the aid of the Almighty, by me, Hartman of Krasna, at that time sacrist of Klosterneuburg.']

'Haupt's information proved the source of much embarrassment to me. In the first place, being an entire novice in the world of scholarship, I was completely dominated by Haupt's authority, and for a long time I read the date given in the subscription lying in front of me - which was perfectly clearly and correctly printed - as 1350 instead of 1850, just as Haupt had done. I did this even though no trace of any subscription could be found in the original Manuscript C, which I used, and though it further transpired that no monk by the name of Hartman had lived at Klosterneuburg at any time in the fourteenth century. And when at last the veil fell from before my eyes I guessed what had happened; and further investigation confirmed my suspicion. The subscription so often referred to is in fact to be found *only* in the copy used by Haupt, and is the work of its copyist, P. Hartman Zeibig, who was born at Krasna in Moravia, was Master of the Augustinian choir at Klosterneuburg, and who as sacrist of the monastery made a copy of Manuscript C and appended his name in the ancient fashion at the end of his copy. The mediaeval phraseology and the old orthography of the subscription doubtless played their part in inducing Haupt always to read 1350 instead of 1850, alongside his *wish* to be able to tell his readers as much as possible about the work he was discussing, and therefore also *to date Manuscript C*. (This was the motive for the parapraxis.)'

(8) In Lichtenberg's *Witzige und Satirische Einfälle* a remark occurs which is no doubt derived from a piece of observation and which comprises virtually the whole theory of misreading: 'He had read Homer so much that he always read "*Agamemnon*" instead of "*angenommen* [supposed]".'

For in a very large number of cases it is the reader's preparedness that alters the text and reads into it something which he is expecting or with which he is occupied. The only contribution towards a misreading which the text itself need make is that of affording some sort of resemblance in the verbal image, which the reader can alter in the sense he requires. Merely glancing at the text, especially with uncorrected vision, undoubtedly increases the possibility of such an illusion, but it is certainly not a necessary precondition for it.

(9) I have an impression that no parapraxis was so greatly encouraged by war conditions - which brought us all such constant and protracted preoccupations - as this particular one of misreading. I have been able to observe a large number of instances of it, but unfortunately I have kept records of only a few of them. One day I picked up a mid-day or evening paper and saw in large print: '*Der Friede von Görz* [The Peace of Gorizia].' But no, all it said was: '*Der Feinde vor Görz* [The Enemy before Gorizia].' It is easy for someone who has two sons fighting at this very time in that theatre of operations to make such a mistake in reading. - Someone else found an 'old *Brotkarte* [bread card]' mentioned in a certain context; when he looked at this more attentively, he had to replace it by 'old *Brokate* [brocades]'. It is perhaps worth mentioning that at a particular house, where this man is often a welcome guest, it is his habit to make himself agreeable to the mistress by handing his bread cards over to her. - An engineer, whose equipment had never stood up for long to the dampness in a tunnel that was under construction, was astonished to read a laudatory advertisement of goods made of '*Schundleder* [shoddy leather]'. But tradesmen are not usually so candid; what was being recommended was '*Seehundleder* [sealskin]'.

The reader's profession or present situation, too, determines the outcome of his misreading. A philologist, whose most recent, and excellent, works had brought him into conflict with his professional colleagues, read '*Sprachstrategie* [language strategy]' in mistake for '*Schachstrategie* [chess strategy]'. - A man who was taking a walk in a strange town just when the action of his bowels was timed to occur by a course of medical treatment read the word 'Closet-House' on a large sign on the first storey of a tall shop-building. His satisfaction on seeing it was mixed with a certain surprise that the obliging establishment should be in such an unusual place. The next moment, however, his satisfaction vanished; a more correct reading of the word on the sign was 'Corset-House'.

(10) In a second group of cases the part which the text contributes to the misreading is a much larger one. It contains something which rouses the reader's defences - some information or imputation distressing to him - and which is therefore corrected by being misread so as to fit in with a repudiation or with the fulfilment of a wish. In such cases we are of course obliged to assume that the text was first correctly understood and judged by the reader before it underwent correction, although his consciousness learnt nothing of this first reading. Example (3) above is of this kind; and I include here a further, highly topical one given by Eitingon (1915), who was at the military hospital at Igló at the time.

'Lieutenant X., who is in our hospital suffering from a traumatic war neurosis, was one day reading me a poem by the poet Walter Heymann, who fell in battle at so early an age. With visible emotion he read the last lines of the final stanza as follows.

Wo aber steht's geschrieben, frag' ich, dass von allen
 Ich übrig bleiben soll, ein anderer für mich fallen?
 Wer immer von euch fällt, der stirbt gewiss für mich;
 Und ich soll übrig bleiben? *warum denn nicht?*¹

[But where is it decreed, I ask, that out of all
 I should alone be left, my fellow for me fall?
 Whoever of you falls, for me that man doth die;
 And I - am I alone to live? *Why should not I?*]

'My surprise caught his attention, and in some confusion he read the line correctly:

Und ich soll übrig bleiben? warum denn *ich*?

[And I - am I alone to live then? Why should *I*?]

'I owe to Case X. some analytic insight into the psychical material of these "traumatic war neuroses", and in spite of the circumstances prevailing in a war hospital with a large number of patients and only a few doctors - circumstances so unfavourable to our way of working - it was then possible for me to see a little way beyond the shell explosions which were so highly esteemed as the "cause" of the illness.

'In this case, too, were to be seen the severe tremors which give pronounced cases of these neuroses a similarity that is so striking at the first glance, as well as apprehensiveness, tearfulness, and a proneness to fits of rage, accompanied by convulsive infantile motor manifestations, and to vomiting ("at the least excitement").

'The psychogenic nature of this last symptom in particular - above all in its contribution to the secondary gain from the illness - must have impressed everyone. The appearance in the ward of the hospital commandant who from time to time inspected the convalescent cases, or a remark made by an acquaintance in the street - "You look in really excellent form, you're certainly fit now" - is enough to produce an immediate attack of vomiting.

"Fit . . . go back to service . . . why should I?"

¹ From 'Den Ausziehenden' ['To Those who have Gone Forth'] in *Kriegsgedichte und Feldpostbriefe* [War Poems and Letters from the Front] by Walter Heymann.

(11) Dr. Hanns Sachs (1917) has reported some other cases of 'war' misreading:

'A close acquaintance of mine had repeatedly declared to me that when his turn came to be called up he would not make any use of his specialist qualifications, which were attested by a diploma; he would waive any claim based on them for being found suitable employment behind the lines and he would enlist for service at the front. Shortly before the call-up date in fact arrived, he told me one day in the curtest way, and without giving any further reason, that he had submitted the evidence of his specialist training to the proper authorities and as a result would shortly be assigned to a post in industry. Next day we happened to meet in a post-office. I was standing up at a desk and writing; he came in, looked over my shoulder for a while and then said: "Oh! the word at the top there's '*Druckbogen* [printer's proofs]' - I'd read it as '*Drückeberger* [shirker]'."

(12) 'I was sitting in a tram and reflecting on the fact that many of the friends of my youth who had always been taken as frail and weakly were now able to endure the most severe hardships - ones which would quite certainly be too much for me. While in the middle of this disagreeable train of thought, I read, only half attentively, a word in large black letters on a shop-sign that we were passing: "Iron Constitution". A moment later it struck me that this word was an inappropriate one to be found on the board of a business-firm; I turned round hastily and catching another glimpse of the sign saw that it really read: "Iron Construction".' (Sachs, *ibid.*)

(13) 'The evening papers carried a Reuter message, which subsequently proved to be incorrect, to the effect that Hughes had been elected President of the United States. This was followed by a short account of the supposed President's career, in which I came across the information that Hughes had completed his studies at *Bonn* University. It struck me as strange that this fact had received no mention in the newspaper discussions during all the weeks before the day of the election. On taking a second look I found that all the text in fact contained was a reference to *Brown* University. The explanation of this gross case, in which the misreading had called for a fairly violent twist, depended - apart from my haste in reading the newspaper - chiefly upon my thinking it desirable that the new President's sympathy for the Central European Powers, as the basis for good relations in the future, should be based on personal motives as well as political ones.' (Sachs, *ibid.*)

(B) SLIPS OF THE PEN

(1) On a sheet of paper containing short daily notes mainly of a business kind I was surprised to find, among some entries correctly dated 'September', the wrongly written date 'Thursday, October 20'. It is not difficult to explain this anticipation - and to explain it as the expression of a wish. A few days before, I had returned fresh from my holiday travels, and I felt ready for plenty of professional work; but there were not yet many patients. On my arrival I had found a letter from a patient to say she was coming on October 20. When I made an entry for the same day of the month in September I may well have thought: 'X. should have been here already; what a waste of a whole month!', and with that thought in mind I brought the date forward a month. In this case the disturbing thought can scarcely be called an objectionable one; and for this reason I knew the solution of the slip of the pen as soon as I had noticed it. - In the autumn of the following year I made another slip of the pen which was precisely analogous and had a similar motive. - Ernest Jones has made a study of slips like these in writing dates; in most cases they could be clearly recognized as having reasons.

(2) I had received the proofs of my contribution to the *Jahresbericht für Neurologie und Psychiatrie*, and I had naturally to revise the names of authors with particular care, since they are of various nationalities and therefore usually cause the compositor very great difficulty. I did in fact find some foreign sounding names which were still in need of correction; but strangely enough there was one name which the compositor had corrected by *departing from* my manuscript. He was perfectly right to do so. What I had in fact written was 'Buckrhard', which the compositor guessed should be 'Burckhard'. I had actually praised the useful treatise which an obstetrician of that name had written on the influence of birth upon the origin of children's palsies, and I was not aware of having anything to hold against him; but he has the same name as a writer in Vienna who had annoyed me by an unintelligent review of my *Interpretation of Dreams*. It is just as if in writing the name Burckhard, meaning the obstetrician, I had had a hostile thought about the other Burckhard, the writer;¹ for distorting names is very often a form of insulting their owners, as I have mentioned above in discussing slips of the tongue.

¹ Compare the scene in *Julius Caesar*, III, 3:

CINNA Truly, my name is Cinna.

A CITIZEN Tear him to pieces; he's a conspirator.

CINNA I am Cinna the poet . . .

I am not Cinna the conspirator.

ANOTHER CITIZEN. It is no matter, his name's Cinna; pluck but
his name out of his heart, and turn him going.

(3) This assertion is very neatly confirmed by a self-observation of Storfer's (1914), in which the author exposes with commendable frankness the motives that prompted him to recollect the name of a supposed rival wrongly and then to write it down in a distorted form:

'In December, 1910, I saw a book by Dr. Eduard *Hitschmann* in the window of a bookshop in Zurich. Its subject was Freud's theory of the neuroses and it was new at the time. Just then I was at work on the manuscript of a lecture on the basic principles of Freud's psychology, which I was shortly to give before a University society. In the introductory part of the lecture which I had already written, I had referred to the historical development of Freud's psychology from his researches in an applied field, to certain consequent difficulties in giving a comprehensive account of its basic principles, and also to the fact that no general account of them had yet appeared. When I saw the book (whose author was till then unknown to me) in the shop window, I did not at first think of buying it. Some days later, however, I decided to do so. The book was no longer in the window. I asked the bookseller for it and gave the author's name as "Dr Eduard *Hartmann*". The bookseller corrected me: "I think you mean *Hitschmann*", and brought me the book.

'The unconscious motive for the parapraxis was obvious. I had so to speak given myself the credit for having written a comprehensive account of the basic principles of psycho-analytic theory, and obviously regarded Hitschmann's book with envy and annoyance since it took some of the credit away from me. I told myself, on the lines of *The Psychopathology of Everyday Life*, that the changing of the name was an act of unconscious hostility. At the time I was satisfied with this explanation.

'Some weeks later I noted down this parapraxis. On this occasion I raised the further question of why Eduard Hitschmann had been altered precisely to Eduard *Hartmann*. Could I have been brought to the name of the well-known philosopher merely because it was similar to the other one? My first association was the memory of a pronouncement which I once heard from Professor Hugo von Meltzl, an enthusiastic admirer of Schopenhauer, and which ran roughly as follows: "Eduard von Hartmann is a botched Schopenhauer, a Schopenhauer turned inside out." The affective trend by which the substitutive-formation for the forgotten name was determined was therefore: "No, there will probably not be much in this Hitschmann and his comprehensive account; he probably stands to Freud as Hartmann does to Schopenhauer."

'I had, as I say, noted down this case of determined forgetting with the forgotten word replaced by a substitute.

'Six months later I came upon the sheet of paper on which I had made the note. I then observed that instead of Hitschmann I had throughout written *Hintschmann*.¹

¹ [*Hintsch* is a dialect word for 'asthma' or, more generally, 'pest'.]

(4) Here is what seems to be a more serious slip of the pen: I might perhaps equally well have included it among 'bungled actions':

I intended to draw the sum of 300 kronen from the Post Office Savings Bank, which I wanted to send to an absent relative for purposes of medical treatment. At the same time I noticed that my account stood at 4,380 kronen and decided to bring it down on this occasion to the round sum of 4,000 kronen which was not to be touched in the near future. After I had duly written out the cheque and cut off the figures corresponding to the sum, I suddenly noticed that I had not asked for 380 kronen as I intended, but for exactly 438 kronen and I took alarm at the unreliability of my conduct. I soon realized that my alarm was not called for; I was not now any poorer than I had been before. But it took me a good deal of reflection to discover what influence had disturbed my first intention, without making itself known to my consciousness. To begin with I started on the wrong line; I tried subtracting 380 from 438, but I had no idea afterwards what to do with the difference. Finally a thought suddenly struck me which showed me the true connection. Why, 438 was *ten per cent* of the total account, 4,380 kronen! Now a ten per cent discount is given by *booksellers*. I recalled that a few days earlier I had picked out a number of medical books in which I was no longer interested in order to offer them to a bookseller for precisely 300 kronen. He thought the price I was asking was too high, and promised to give me a definite answer within the next few days. If he accepted my offer he would replace the exact sum which I was to spend on the invalid. There is no doubt that I regretted this expenditure. My affect on perceiving my error can be understood better as a fear of growing poor as a result of such expenditures. But both these feelings, my regret at the expenditure and my anxiety over becoming poor that was connected with it, were entirely foreign to my consciousness; I did not have a feeling of regret when I promised the sum of money, and would have found the reason for it laughable. I should probably not have believed myself in any way capable of such an impulse had I not become fairly familiar, through my psycho-analytic practice with patients, with the part played by the repressed in mental life, and had I not had a dream a few days before which called for the same solution.¹

¹ This is the one which I took as the specimen dream in my short work *On Dreams* (1901a).

(5) I quote the following case from Wilhelm Stekel, and can also vouch for its authenticity:

'A simply incredible example of a slip of the pen and misreading occurred in the editing of a widely-read weekly periodical. The proprietors in question had been publicly described as "venil"; and an article in defence and vindication was clearly called for. One was in fact prepared: it was written with great warmth and feeling. The editor-in-chief read the article, while the author naturally read it several times in manuscript and then once more in galley-proof; everyone was perfectly satisfied. Suddenly the printer's reader came forward and pointed out a small mistake which had escaped everyone's notice. There it was, plainly enough: "Our readers will bear witness to the fact that we have always acted in the most *self-seeking* manner for the good of the community." It is obvious that it should have read: "in the most *unself-seeking* manner". But the true thoughts broke through the emotional statement with elemental force.'

(6) A reader of the *Pester Lloyd*, Frau Kata Levy of Budapest, recently came across a similar unintended display of candour in a telegram from Vienna which appeared in the paper on October 11, 1918:

'In view of the complete mutual confidence which has prevailed between ourselves and our German allies throughout the war, it may be taken for certain that the two Powers would reach a unanimous decision in all circumstances. It is unnecessary to state specifically that active and *interrupted* co-operation between the allied diplomatists is taking place at the present stage as well.'

Only a few weeks later it was possible to express one's opinion more frankly about this 'mutual confidence', and there was no longer any need to take refuge in a slip of the pen (or misprint).

(7) An American living in Europe who had left his wife on bad terms felt that he could now effect a reconciliation with her, and asked her to come across the Atlantic and join him on a certain date. 'It would be fine,' he wrote, 'if you could come on the *Mauretania* as I did.' He did not however dare to send the sheet of paper which had this sentence on it. He preferred to write it out again. For he did not want her to notice how he had had to correct the name of the ship. He had first written '*Lusitania*'.

This slip of the pen needs no explanation: its interpretation is perfectly plain. But a happy chance enables a further point to be added. Before the war his wife paid her first visit to Europe after the death of her only sister. If I am not mistaken, the *Mauretania* is the surviving sister-ship of the *Lusitania*, which was sunk in the war.

(8) A doctor had examined a child and was making out a prescription for it, which included the word '*alcohol*'. While he was occupied in doing so the child's mother pestered him with stupid and unnecessary questions. He privately determined not to let this make him angry, and actually succeeded in keeping his temper, but made a slip of the pen in the course of the interruptions. Instead of *alcohol* the word *achol*¹ could be read on the prescription.

(9) The following example, which Ernest Jones reports about A. A. Brill, has a similar subject-matter, and I therefore insert it here. Although by custom a total abstainer, he allowed himself to be persuaded by a friend to drink a little wine. Next morning an acute headache gave him cause to regret having yielded in this way. He had occasion to write the name of a patient called *Ethel*; instead he wrote *Ethyl*.² It was no doubt of some relevance that the lady in question used to drink more than was good for her.

¹ Approximately: 'No choler.'

² I.e. ethyl alcohol.

(10) Since a slip of the pen on the part of a doctor who is writing a prescription possesses a significance which goes far beyond the practical importance of ordinary parapraxes, I take the opportunity of reporting in full the only analysis published up to now of such a slip made by a doctor:

From Dr. Eduard Hitschmann (1913*b*): 'A colleague tells me that several times over a period of years he had made an error in prescribing a certain drug for women patients of an advanced age. On two occasions he prescribed ten times the correct dose; only later did he suddenly realize this and was obliged, in the greatest anxiety in case he had harmed his patient and put himself in a very unpleasant position, to take the most hurried steps to recall the prescription. This singular symptomatic act deserves to be clarified by a more precise description of the individual instances and by an analysis.

'First instance: In treating a poor woman bordering on extreme old age who was suffering from spastic constipation the doctor prescribed belladonna suppositories ten times too strong. He left the out-patients' department, and his error suddenly sprang to his mind about an hour later while he was at home reading the paper and having lunch; he was overcome by anxiety, rushed first to the out-patients' department to obtain the patient's address and hastened from there to her home, which was a long way off. He was delighted to find that the old woman had not yet had the prescription made up, and he returned home much relieved. The excuse that he gave himself on this occasion was the not unjustified one that the talkative head of the out-patients' department had looked over his shoulder while he was writing the prescription and had distracted him.

'Second instance: The doctor was obliged to tear himself away from a consultation with a flirtatious and provocatively attractive patient in order to pay a professional visit to an elderly spinster. He took a taxi, not having much time to spare for the visit; for he was due to keep a secret rendezvous with a girl he was in love with, at a certain time, near her house. Here, too, belladonna was indicated because of troubles analogous to those in the first instance. Once again he made the mistake of prescribing a quantity ten times too strong. The patient raised a question that was of some interest but irrelevant to the matter in hand; the doctor, however, showed impatience, though his words denied it, and left the patient, so that he appeared at the rendezvous in very good time. Some twelve hours later, at about seven o'clock in the morning, the doctor woke up; the thought of his slip of the pen and a feeling of anxiety came almost simultaneously to his consciousness, and he sent a hasty message to the patient in the hope that the medicine had not yet been collected from the chemist's, and asked for the prescription to be sent back in order to be revised. On receiving it however he found that the prescription had already been made up; with a somewhat stoical resignation and an optimism born of experience he went to the chemist, where the dispenser reassured him by explaining that he had naturally (or perhaps by mistake too?) made up the drug in a smaller dose.

'Third instance: The doctor wanted to prescribe a mixture of *Tinct. belladonnae* and *Tinct. Opii* in a harmless dose for his old aunt, his mother's sister. The prescription was immediately taken to the chemist by the maid. A very short time later it occurred to the doctor that instead of "tincture" he had written "extract", and immediately afterwards the chemist telephoned to question him about the error. The doctor gave as an excuse the untruthful explanation that he had not completed the prescription - it had been carried off from his table with unexpected suddenness, so it was not his fault.

'These three errors in making out prescriptions have the following striking points of resemblance. Up to now it has only happened to the doctor with this one drug; each time it involved a woman patient of advanced years, and each time the dose was *too strong*. From the brief analysis it emerged that the doctor's relation to his mother must have been of decisive importance. For he recalled that on one occasion - one, moreover, which most probably occurred *before* these symptomatic acts - he had made out the same prescription for his mother, who was also an old woman; he had ordered a dose of 0.03, although he was more familiar with the usual dose of 0.02. This, as he told himself, was in order to give her radical help. His frail mother reacted to the drug with congestion in the head and an unpleasant dryness of the throat. She complained of this, alluding half-jokingly to the risks that could come from a consultation with a son. There were in fact other occasions when his mother, who was, incidentally, a doctor's daughter, raised similar critical and half jocular objections to drugs recommended at various times by her doctor son, and spoke of being poisoned.

'So far as the present writer can fathom this son's relations with his mother, there is no doubt that he is an instinctively affectionate child, but his mental estimate of his mother and his personal respect for her are by no means exaggerated. He shares a household with a brother a year younger than himself and with his mother, and has felt for years that this arrangement was inhibiting his erotic freedom. We have, of course, learnt from psycho-analytic experience that such reasons are readily misused as an excuse for an internal attachment. The doctor accepted the analysis, being fairly well satisfied with the explanation, and laughingly suggested that the word '*belladonna*' (i.e., beautiful woman) could also have an erotic reference. He had also occasionally used the drug himself in the past.'

In my judgement serious parapraxes like the present ones are brought about in exactly the same way as the innocent ones that we normally investigate.

(11) The next slip of the pen, reported by Sándor Ferenczi, will be thought quite especially innocent. It can be understood as being an act of condensation, resulting from impatience (compare the slip of the tongue, 'Der Apfe', above, p. 1152); and this view might have been maintained if a penetrating analysis of the occurrence had not revealed a stronger disturbing factor:

"I am reminded of the *Anektode*",¹ I once wrote in my note book. Naturally I meant "*Anekdote*"; actually it was the one about a gipsy who had been sentenced to death, and who asked as a favour to be allowed himself to choose the tree from which he was to be hanged. (In spite of a keen search he failed to find any suitable tree.)'

(12) On the other hand there are times when the most insignificant slip in writing can serve to express a dangerous secret meaning. An anonymous correspondent reports:

'I ended a letter with the words: "Herzlichste Grüsse an Ihre Frau Gemahlin und *ihren* Sohn."² Just before I put the sheet in the envelope I noticed the error I had made in the first letter of "*ihren*" and corrected it. On the way home from my last visit to this married couple the lady who was with me had remarked that the son bore a striking resemblance to a family friend and was in fact undoubtedly his child.'

¹ [A non-existent word; but the last part of it, '*Tode*', means 'death'.]

² ['Warmest greetings to your wife and her son.' The German possessive adjective '*ihr*', as spelt with a small 'i', means 'her'; when spelt with a capital 'I', it means 'your'.]

(13) A lady sent her sister a message of good wishes on the occasion of her taking up residence in a new and spacious house. A friend who was present noticed that the writer had put the wrong address on the letter. She had not even addressed it to the house that her sister had just left, but to her first house which she had moved into immediately after her marriage and had given up long before. This friend drew the lady's attention to the slip. 'You're right', she was forced to confess; 'but how did the idea come into my head? Why did I do it?' 'I think', said her friend, 'you probably grudge her the fine large home which will now be hers, while you feel yourself cramped for space; and therefore you put her back in her first home where she was no better off than you are.' 'I certainly grudge her her new home', the other frankly admitted, and added: 'What a pity one's always so petty in such things!'

(14) Ernest Jones reports the following slip of the pen, which was supplied to him by A. A. Brill: 'A patient wrote to him on the subject of his sufferings, which he tried to attribute to worry about his financial affairs induced by a cotton crisis: "My trouble is all due to that d---d frigid wave; there isn't even any seed." (By "wave" he meant of course a trend in the money market.) What he really wrote, however, was not "wave" but "wife". In the bottom of his heart he cherished half-avowed reproaches against his wife on account of her sexual anaesthesia and childlessness, and he dimly realized, with right, that his life of enforced abstinence played a considerable part in the genesis of his symptoms.'

(15) Dr. R. Wagner (1911) relates of himself: 'In reading through an old lecture note-book I found that I had made a small slip in the hurry of taking down the notes. Instead of "*Epithel* [epithelium]", I had written "*Edithel*". If we stress the first syllable we have the diminutive form of a girl's name.¹ The retrospective analysis is simple enough. At the time I made the slip I was only very superficially acquainted with the lady of this name; it was not till much later that our relations became intimate. The slip of the pen is therefore a neat indication of the break-through of the unconscious attraction I felt to her at a time when I myself actually had no inkling of it, and my choice of the diminutive form at the same time showed the nature of the accompanying feelings.'

¹ [In Austria 'i' is the common diminutive termination.]

(16) From Frau Dr. von Hug-Hellmuth (1912):

'A doctor prescribed "*Leviticowasser*" for a woman patient instead of "*Levicowasser*". This error, which gave a chemist a welcome opportunity for passing adverse comments, may very well be viewed in a milder light if one looks out for the possible motivations arising from the unconscious and is prepared at any rate to concede them a certain plausibility - even though they are merely the subjective conjectures of someone who is not closely acquainted with the doctor. In spite of his habit of using somewhat harsh language to scold his patients for their far-from-rational diet - to read them a lecture, so to speak - the doctor enjoyed great popularity, so that his waiting-room was crowded before and during his consulting hour; and this provided a justification for his wish that the patients he had seen should dress as quickly as possible - "*vite, vite*". If I remember correctly, his wife was French by birth: this lends some support to my seemingly rather bold assumption that he used *French* in his wish for greater speed from his patients. It is in any case a habit of many people to draw on foreign words to express such wishes: my own father hurried us along as children on our walks by calling out "*avanti gioventù*" [Italian for "forward, youth"] or "*marchez au pas*" [French for "forward march"]; while a very elderly physician, with whom I was in treatment for a throat complaint as a girl, used to try to inhibit my movements, which seemed much too hasty to him, by murmuring a soothing "*piano, piano*" [Italian for "gently, gently"]. Thus I can very easily imagine that the other doctor had the same habit too, and so made the slip of writing "*Leviticowasser*" instead of "*Levicowasser*".'

The same paper contains other examples recalled from its author's youth ('*frazösisch*' instead of '*französich*', and a slip in writing the name 'Karl').

(17) I have to thank Herr J. G., who also contributed an example mentioned above for the following account of a slip of the pen. In content it is identical with a notorious bad joke, but in this case the intention of making a joke could be definitely ruled out:

'While I was a patient in a (lung-) sanatorium I learnt to my regret that the same illness which had forced me to seek treatment in an institution had been diagnosed in a close relative of mine. In a letter to my relative I recommended him to go to a specialist, a well-known professor, with whom I was myself in treatment, and of whose authority in medical matters I was fully satisfied, while having at the same time every reason to deplore his discourteousness: for, only a short time before, this same professor had refused to write me a testimonial which it was very important for me to have. In his reply to my letter my relative drew my attention to a slip of the pen which, since I immediately recognized the cause of it, gave me particular amusement. In my letter I had used the following phrase: "and so I advise you to *insult* Professor X. without delay". I had of course, intended to write "*consult*". I should perhaps point out that my knowledge of Latin and French rules out the possibility of explaining it as a mistake due to ignorance.'

(18) Omissions in writing have naturally a claim to be considered in the same light as slips of the pen. Dattner (1911) has reported a curious instance of a 'historical parapraxis'. In one of the sections of the law dealing with the financial obligations of Austria and Hungary, settled in the 'Compromise' of 1867 between the two countries, the word 'actual' was left out of the Hungarian translation; and Dattner makes it plausible to suppose that the unconscious desire of the Hungarian parliamentary draftsmen to grant Austria the least possible advantages played a part in causing the omission.

We have every reason to suppose, too, that the very frequent repetitions of the same word in writing and copying - 'perseverations' - are likewise not without significance. If the writer repeats a word he has already written, this is probably an indication that it was not so easy for him to get away from it: that he could have said more at that point but had omitted to do so, or something of the kind. Perseveration in copying seems to be a substitute for saying 'I too'. I have had lengthy medico-legal 'opinions' before me which show perseverations on the copyist's part at particularly important passages. The interpretation I should have liked to give them would be that, bored with his impersonal role, the copyist was introducing his own gloss: 'Just my case' or 'it's just the same with us.'

(19) Furthermore, there is nothing to prevent our treating misprints as 'writing mistakes' on the compositor's part, and our regarding them as being in a very great measure motivated. I have not set about making a systematic collection of such parapraxes, which could be very amusing and instructive. In the work which I have already referred to a number of times, Jones has devoted a special section to misprints.

The distortions found in the text of telegrams can also at times be understood as writing mistakes on the telegraphist's part. In the summer holidays I received a telegram from my publishers, the text of which was unintelligible to me. It ran: 'Vorräte erhalten, Einladung X. dringend.' The solution of the riddle starts from the name X. mentioned in it. X. was the author of a book to which I was to write an '*Einleitung*'. This '*Einleitung*' was what had been turned into the '*Einladung*'. I was then able to recall that some days earlier I had sent my publishers a '*Vorrede*' to another book; so this was the acknowledgement of its arrival. The true text had very probably run: 'Vorrede erhalten, *Einleitung* X. dringend.' We may assume that it had fallen victim to a revision by the telegraphist's hunger-complex, in the course of which, moreover the two halves of the sentence became linked more closely than the sender had intended. It is, incidentally, a pretty instance of the 'secondary revision' that can be seen at work in most dreams.¹

¹ Cf. the chapter on the dream-work in my *Interpretation of Dreams*.

The possibility of 'tendentious misprints' has been discussed by Herbert Silberer (1922).

(20) From time to time other writers have drawn attention to misprints the tendentiousness of which cannot easily be challenged. See, for example, Storfer's paper 'The Political Demon of Misprints' (1914) and his short note (1915) which I reprint here:

'A political misprint is to be found in the issue of März for April 25 of this year. A dispatch from Argyrokastron reported some remarks made by Zographos, the leader of the insurgent Epirotes in Albania (or, if that is preferred, the President of the Independent Government of the Epirus). It included the following phrase: "Believe me: a self-governing Epirus would be in the most fundamental interest of Prince Wied. He could fall down on it." Even without this fatal misprint the Prince of Albania is no doubt well aware that the acceptance of the support offered him by the Epirotes would mean his downfall '.

(21) I myself recently read an article in one of our Vienna daily papers, the title of which - 'The Bukovina under *Rumanian* Rule' - would have at least to be called premature, since at the time Rumania had not yet disclosed herself as an enemy. From the content of the article it was quite clear that the word should have been 'Russian', not 'Rumanian'; yet the censor, too, seems to have found the phrase so little surprising that even he overlooked this misprint,

It is hard to avoid suspecting a 'political' misprint on coming across the following 'literal' misprint in a circular from the celebrated (formerly the Imperial and Royal) printing firm of Karl Prochaska in Teschen:

'By a decree of the Entente Powers, fixing the frontier at the River Olsa, not only Silesia but Teschen as well have been divided into two parts, of which one *zuvief*¹ to Poland and the other to Czecho-Slovakia.'

¹ ['Too much.' The word should have been the similarly pronounced '*zufiel*', 'fell to the share of'.]

Theodor Fontane was once obliged to take up arms in an amusing way against a misprint which was only too full of meaning. On March 29, 1860, he wrote to the publisher Julius Springer:

‘Dear Sir,

‘I seem to be fated not to see my modest wishes fulfilled. A glance at the proof sheets¹ which I enclose will tell you what I mean. What is more, I have been sent only *one* set of proofs, although I need two, for reasons which I have already given. And my request that the first set should be returned to me for further revision - *with special regard to the English words and phrases* - has not been carried out. I set great store by this. For instance, on page 27 of the present sheets a scene between John Knox and the Queen contains the words: "worauf Maria aasrief."² In the face of such a fulminating mistake, it would be a relief to know that it has really been removed. The unfortunate "aas" for "aus" is made all the worse by there being no doubt that she (the queen) must really have called him that to herself.

‘Yours faithfully,

‘Theodor Fontane.’

Wundt (1900, 374) gives an explanation which deserves notice for the fact (which can easily be confirmed) that we make slips of the pen more readily than slips of the tongue. ‘In the course of normal speaking the inhibitory function of the will is continuously directed to bringing the course of ideas and the articulatory movements into harmony with each other. If the expressive movement which follows the ideas is retarded through mechanical causes, as is the case in writing . . ., such anticipations make their appearance with particular ease.’

¹ The book in question was *Beyond the Tweed: Sketches and Letters from Scotland*, which Julius Springer published in 1860.

² [‘On which Mary "aasrief"': i. e., cried ‘Aas’ (literally, ‘carrion’; colloquially, ‘filthy blackguard’). The word should have been ‘Ausrief’ meaning simply ‘cried out’.]

Observation of the conditions under which misreadings occur gives rise to a doubt which I should not like to leave unmentioned, because it can, I think, become the starting-point for a fruitful investigation. Everyone knows how frequently the reader finds that in *reading aloud* his attention wanders from the text and turns to his own thoughts. As a result of this digression on the part of his attention he is often unable, if interrupted and questioned, to give any account of what he has read. He has read, as it were, automatically, but almost always correctly. I do not think that under such conditions mistakes in reading show a noticeable increase. There is in fact a whole series of functions which we are accustomed to assume will be performed most exactly when done automatically - that is, with scarcely any conscious attention. From this it seems to follow that the factor of attention in mistakes in speaking, reading and writing must be determined in a different way from that described by Wundt (cessation or diminution of attention). The examples which we have subjected to analysis have not really justified us in assuming that there was a quantitative lessening of attention; we found something which is perhaps not quite the same thing: a *disturbance* of attention by an alien thought which claims consideration.

Between 'slips of the pen' and 'forgetting' may be inserted the case of someone who forgets to append a signature. An unsigned cheque comes to the same thing as a forgotten cheque. For the significance of a forgetting of a similar kind I will cite a passage from a novel, which Dr. Hanns Sachs came upon:

'A very instructive and transparent example of the sureness with which imaginative writers know how to employ the mechanism of parapraxes and symptomatic acts in the psycho-analytic sense is contained in John Galsworthy's novel *The Island Pharisees*. The story centres round the vacillations of a young man of the well-to-do middle-class between his strong social sympathy and the conventional attitudes of his class. Chapter XXVI portrays the way in which he reacts to a letter from a young ne'er-do-well, to whom - prompted by his original attitude to life - he had supplied help on two or three occasions. The letter contains no direct request for money, but paints a picture of great distress which can have no other meaning. Its recipient at first rejects the idea of throwing this money away on a hopeless case instead of using it to support charitable causes. "To give a helping hand, a bit of himself, a nod of fellowship to any fellow-being irrespective of a claim, merely because he happened to be down, was sentimental nonsense! The line must be drawn! But in the muttering of this conclusion he experienced a twinge of honesty. 'Humbug! You don't want to part with your money, that's all!'"

'Thereupon he wrote a friendly letter, ending with the words: "I enclose a cheque. Yours sincerely, Richard Shelton."

"Before he had written out the cheque, a moth fluttering round the candle distracted his attention, and by the time he had caught and put it out he had forgotten that the cheque was not enclosed." The letter was posted in fact just as it was.

'There is however an even subtler motivation for the lapse of memory than the break-through of the selfish purpose, which, had apparently been surmounted, of avoiding giving away the money.

'At the country seat of his future parents-in-law, surrounded by his fiancée, her family and their guests, Shelton felt isolated; his parapraxis indicates that he longed for his protégé who, as a result of his past and of his view of life, forms a complete contrast to the irreproachable company, uniformly moulded by one and the same set of conventions, that surround him. And in fact this person, who can no longer keep his place without being supported, does in fact arrive some days later to get an explanation of why the promised cheque was not there.'

CHAPTER VII

THE FORGETTING OF IMPRESSIONS AND INTENTIONS

If anyone should feel inclined to over-estimate the state of our present knowledge of mental life, a reminder of the function of memory is all that would be needed to force him to be more modest. No psychological theory has yet succeeded in giving a connected account of the fundamental phenomenon of remembering and forgetting; in fact, the complete analysis of what can actually be observed has so far scarcely been begun. To-day forgetting has perhaps become more of a puzzle than remembering, ever since we have learnt from the study of dreams and pathological phenomena that even something we thought had been forgotten long ago may suddenly re-emerge in consciousness.

There are, it is true, a few indications already in our possession which we expect to be accepted generally. We assume that forgetting is a spontaneous process which may be regarded as requiring a certain length of time. We lay stress on the fact that forgetting involves a certain selection taking place from among the impressions presented to us, and similarly from among the details of each impression or experience. We know some of the conditions enabling what would otherwise have been forgotten to be retained in the memory and to be re-awakened. Nevertheless, on countless occasions in daily life we can observe how imperfect and unsatisfactory our understanding of these conditions is. Thus we may listen to two people who were in receipt of the same external impressions - who took a journey together, for example - exchanging recollections at some later date. What has remained firm in the memory of one of them has often been forgotten by the other, as if it had never happened; and this is true even where there is no justification for assuming that the impression was psychically of greater importance for the one than for the other. A whole quantity of factors determining the choice of what is to be remembered are obviously still beyond our ken.

With the aim of making a small contribution to our knowledge of the determinants of forgetting I make it my practice to submit to a psychological analysis those cases in which I myself forget something. I am as a rule only concerned with a certain group of these cases, namely those in which the forgetting surprises me because I should have expected to know the thing in question. I may add that I am not in general inclined to forget things (things I have experienced, that is, not things I have learned!), and that for a short period of my youth some unusual feats of memory were not beyond me. When I was a schoolboy I took it as a matter of course that I could repeat by heart the page I had been reading; and shortly before I entered the University I could write down almost verbatim popular lectures on scientific subjects directly after hearing them. In the period of tension before my final medical examination I must have made use once more of what remained of this faculty, for in some subjects I gave the examiners, as though it were automatically, answers which faithfully followed the words of the textbook that I had skimmed through only once in the greatest haste.

Since then the command that I have over my store of memories has steadily deteriorated; yet right up to the most recent times I have convinced myself over and over again that with the aid of a certain device I can remember far more than I would otherwise have believed possible. When, for instance, a patient in my consulting hour claims that I have seen him before and I can recall neither the fact nor the time, I help myself by guessing: that is to say, I quickly think of a number of years, counting back from the present. In cases where records or more definite information from the patient enable me to check what has come to my mind, they show that I have rarely been more than half a year out in ten.¹ I have a similar experience when I meet a distant acquaintance and out of politeness enquire after his small children. If he describes their progress I try to think at random of the child's present age. I afterwards check my estimate by what the father tells me; and at the most I am wrong by a month, or with older children by three months, although I am unable to say on what my estimate was based. I have latterly grown so bold that I always produce my estimate spontaneously without running any risk of offending the father by exposing my ignorance about his offspring. In this way I extend my conscious memory by invoking my unconscious memory, which is in any case far more extensive.

¹ In the course of the subsequent consultation the details of the previous visit usually emerge into my consciousness.

I shall accordingly cite some *striking* examples of forgetting: most of which I observed in myself. I distinguish the forgetting of impressions and experiences - i.e., of knowledge - from the forgetting of intentions - i.e., from omission to do things. I can state in advance the invariable result of the entire series of observations: *in every case the forgetting turned out to be based on a motive of unpleasure.*

(A) THE FORGETTING OF IMPRESSIONS AND KNOWLEDGE

(1) One summer holiday my wife made me greatly annoyed though the cause was innocent enough. We were sitting at table d'hôte opposite a gentleman from Vienna whom I knew and who no doubt remembered me too. However, I had reasons of my own for not renewing the acquaintance. My wife, who had heard no more than his distinguished name, revealed too plainly that she was listening to his conversation with his neighbours, for from time to time she turned to me with questions that took up the thread of their discussion. I became impatient and finally irritated. Some weeks later I was complaining to a relative about this behaviour on my wife's part but was unable to recall a single word of the gentleman's conversation. As I am normally rather apt to harbour grievances and can forget no detail of an incident that has annoyed me, my amnesia in the present case was probably motivated by consideration for my wife. A short time ago I had a similar experience. I wished to have a good laugh with an intimate friend over a remark made by my wife only a few hours before, but was prevented from doing so by the singular fact that I had utterly forgotten what she had said. I had first to ask my wife to remind me what it was. It is easy to understand my forgetfulness here as being analogous to the typical disturbance of judgement to which we are subject where those nearest to us are concerned.

(2) I had undertaken to get a lady who was a stranger to Vienna a small strong-box for her documents and money. When I offered my services I had in my mind's eye an unusually vivid picture of a shop-window in the Inner Town in which I was sure I had seen boxes of the kind. I could not, it was true, recall the name of the street, but I felt sure that I would find the shop if I walked through the town, since my memory told me I had passed it on countless occasions. To my chagrin I had no success in finding the shop-window with the strong-boxes, though I walked all over the Inner Town in every direction. I decided that the only course left was to look up the firms of safe-manufacturers in a trades directory, so as to be able to identify the shop on a second walk round the town. Such extreme measures, however, did not prove necessary; among the addresses given in the directory was one which I immediately recognized as the one I had forgotten. It was true that I had passed the shop-window innumerable times - every time, in fact, that I had visited the M. family, who have lived for many years in the same building. Our intimate friendship later gave place to a total estrangement; after that, I fell into the habit - the reasons for which I never considered - of also avoiding the neighbourhood and the house. On my walk through the town in search of the shop-window with the strong-boxes I had passed through every street in the district but this one, which I had avoided as if it were forbidden territory. The motive of unpleasure responsible in the present case for my failure to find my way is easy to recognize. The mechanism of forgetting, however, is not so simple here as in the preceding example. My aversion naturally applied not to the safe-manufacturer but to another person, whom I did not want to think about; and from this latter person it was then transferred to this occasion where it produced the forgetting. The case of 'Burckhard' was very similar; my grudge against one person of this name induced me to make a slip in writing the same name when it referred to someone else. The part there played by identity of name in establishing a connection between two essentially different groups of thoughts was able to be replaced in the example of the shop-window by spatial contiguity, inseparable proximity. This latter case was, incidentally, more firmly knit; there was a second connection there, one involving its subject-matter, for money played a part among the reasons for my estrangement from the family living in the building.

(3) I was requested by the firm of B. and R. to pay a professional visit to one of their staff. On my way there I was possessed by the thought that I must repeatedly have been in the building where their firm had its premises. It was as if I had noticed their plate on a lower storey while I was paying a professional visit on a higher one. I could however recall neither what house it was nor whom I had visited there. Although the whole matter was of no importance or consequence, I nevertheless turned my mind to it and finally discovered in my usual roundabout way, by collecting the thoughts that occurred to me in connection with it, that the premises of the firm of B. and R. were on the floor below the Pension Fischer, where I have frequently visited patients. At the same time I also recalled the building that housed the offices and the pension. It was still a puzzle to me what motive was at work in this forgetting. I found nothing offensive to my memory in the firm itself or in the Pension Fischer or the patients who lived there. Moreover, I suspected that nothing very distressing could be involved; otherwise I would hardly have succeeded in recovering in a roundabout way what I had forgotten, without resorting to external assistance as I had in the previous example. It finally occurred to me that while I was actually on my way to this new patient, a gentleman whom I had difficulty in recognizing had greeted me in the street. I had seen this man some months before in an apparently grave condition and had passed sentence on him with a diagnosis of progressive paralysis; but later I heard he had recovered, so that my judgement must have been wrong. Unless, that is, there had been a remission of the type that is also found in dementia paralytica - in which case my diagnosis would be justified after all! The influence that made me forget where the offices of B. and R. were came from my meeting with this person, and my interest in solving the problem of what I had forgotten was transferred to it from this case of disputed diagnosis. But the associative link (for there was only a slender internal connection - the man who recovered contrary to expectation was also an official in a large firm which used to recommend patients to me) was provided by an identity of names. The physician with whom I had seen the supposed case of paralysis was also called Fischer, like the pension which was in the building and which I had forgotten.

(4) Mislaying something is really the same as forgetting where it has been put. Like most people who are occupied with writing and books I know my way about on my writing-table and can lay my hands straight away on what I want. What appears to other people as disorder is for me order with a history behind it. Why, then, did I recently mislay a book-catalogue, which had been sent to me, so that it was impossible to find it? I had in fact intended to order a book, *Über die Sprache*, which was advertised in it, since it was by an author whose witty and lively style I like and whose insight in psychology and knowledge of the history of civilization I have learnt to value. I believe that this is precisely why I mislaid the catalogue. For it is my habit to lend books by this author to my acquaintances for their enlightenment, and a few days previously one of them had remarked as he returned a copy: 'His style reminds me very much of your own, and his way of thinking, too, is the same as yours.' The speaker did not know what he was touching on by that remark. Years before, when I was younger and in greater need of outside contacts, an elder colleague to whom I had praised the writings of a well-known medical author had made almost the same comment: 'It's just your style and your manner.' Prompted by this remark I had written a letter to the author seeking closer relations with him, but had been put in my place by a chilly answer. Perhaps still earlier discouraging experiences as well lie concealed behind this one, for I never found the mislaid catalogue and was in fact deterred by this omen from ordering the advertised book, although the disappearance of the catalogue formed no real hindrance since I could remember the names of both book and author.

(5) Another case of mislaying merits our interest on account of the conditions under which the mislaid object was rediscovered. A youngish man told me the following story: 'Some years ago there were misunderstandings between me and my wife. I found her too cold, and although I willingly recognized her excellent qualities we lived together without any tender feelings. One day, returning from a walk, she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of 'attention', promised to read the book and put it on one side. After that I could never find it again. Months passed by, in which time I occasionally remembered the lost book and made vain attempts to find it. About six months later my dear mother, who was not living with us, fell ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife an opportunity of showing the best side of herself. One evening I returned home full of enthusiasm and gratitude for what my wife had accomplished. I walked up to my desk, and without any definite intention but with a kind of somnambulistic certainty opened one of the drawers. On the very top I found the long lost book I had mislaid.'

(6)) A case of mislaying which shares the last characteristic of the above example - namely, the remarkable sureness shown in finding the object again once the motive for its being mislaid had expired - is reported by Stärrcke (1916):

'A girl had spoilt a piece of material in cutting it out to make a collar; so the dressmaker had to come and do her best to put it right. When she had arrived and the girl wanted to fetch the badly-cut collar, she went to the drawer where she thought she had put it; but she could not find it. She turned the contents upside down without discovering it. Sitting down in exasperation she asked herself why it had suddenly disappeared and whether there was not some reason why she did not *want* to find it. She came to the conclusion that of course she felt ashamed in front of the dressmaker for having bungled something so simple as a collar. After this reflection she stood up, went to another cupboard and was able to lay her hands straight away on the badly-cut collar.'

(7) The following example of 'mislaying' is of a type that has become familiar to every psycho-analyst. I may remark that the patient responsible for it found the solution himself:

'A patient, whose psycho-analytic treatment was interrupted by the summer holidays at a time when he was in a state of resistance and felt unwell, put his bunch of keys in its usual place - or so he thought - when he undressed for the night. Then he remembered that there were a few more things that he needed for his journey next day - the last day of treatment and the date on which his fee was due - and he went to get them out of the writing-desk, in which he had also put his money. But the keys had disappeared. He began to make a systematic but increasingly agitated search of his small flat - with no success. Since he recognized the "mislaying" of the keys as a symptomatic act - that is, as something he had done intentionally - he woke his servant in order to continue the search with the aid of an "unprejudiced" person. After another hour he gave it up and was afraid he had lost the keys. Next morning he ordered new keys from the makers of the desk, and they were hastily made for him. Two friends, who had come home with him in the same cab, thought they remembered hearing something fall with a clink on the ground as he stepped out of the cab. He was convinced that his keys had fallen from his pocket. That evening the servant triumphantly presented him with the keys. They had been found lying between a thick book and a thin pamphlet (a work by one of my pupils) which he wanted to take away to read on his holiday. They were so cleverly placed that no one would have suspected they were there. He found himself afterwards unable to replace them so that they were equally invisible. The unconscious dexterity with which an object is mislaid on account of hidden but powerful motives is very reminiscent of "somnambulistic certainty". The motive, as one would expect, was ill-temper at the treatment being interrupted and secret rage at having to pay a high fee when he was feeling so unwell.'

(8) 'A man', Brill relates, 'was urged by his wife to attend a social function in which he really took no interest . . . Yielding to his wife's entreaties, he began to take his dress-suit from the trunk when he suddenly thought of shaving. After accomplishing this he returned to the trunk and found it locked. Despite a long, earnest search the key could not be discovered. No locksmith was available on Sunday evening, so that the couple had to send their regrets. When he had the trunk opened the next morning the lost key was found within. The husband had absent-mindedly dropped the key into the trunk and sprung the lock. He assured me that this was wholly unintentional and unconscious, but we know that he did not wish to go to this social affair. The mislaying of the key therefore lacked no motive.'

Ernest Jones observed in himself that he was in the habit of mislaying his pipe whenever he had smoked too much and felt unwell in consequence. The pipe then turned up in all sorts of places where it did not belong and where it was not normally put away.

(9) An innocent case, in which the motivation was admitted, is reported by Dora Müller (1915):

'Fräulein Erna A. told me two days before Christmas: "Can you imagine? Yesterday evening I took a piece of my ginger-bread from the packet and ate it; at the same time I thought I would have to offer some to Fräulein S." (her mother's companion) "when she came to say goodnight to me. I didn't particularly want to, but I made up my mind to do so all the same. Later on when she came I reached out to get the packet from my table; but it was not there. I had a look for it and found it inside my cupboard. I had put the packet away there without realizing." No analysis was necessary; the narrator herself understood the sequence of events. The impulse of wanting to keep the cake all to herself, which had just been repressed, had nevertheless achieved its end in the automatic act, though in this case it was cancelled out once more by the subsequent conscious act.'

(10) Sachs describes how, by a similar act of mislaying, he once avoided the duty of working: 'Last Sunday afternoon I hesitated for some time over whether I should work or take a walk and pay a visit at the end of it; but after a bit of a struggle I decided in favour of the former. After about an hour I noticed that my supply of paper was exhausted. I knew that somewhere in a drawer there was a stack of paper that I had had for years, but I looked in vain for it in my writing desk and in other places where I thought I might find it, although I went to a lot of trouble and rummaged round in every possible place - old books, pamphlets, letters and so on. Thus I finally found myself compelled to break off my work and go out after all. When I returned home in the evening, I sat down on the sofa, and, sunk in thought and half absent-mindedly, gazed at the book-case in front of me. A box caught my eye and I remembered that I had not examined its contents for a long time. So I went over and opened it. At the very top was a leather portfolio containing unused paper. But it was only when I had taken it out and was on the point of putting it in the drawer of my desk that it occurred to me that this was the very same paper I had been unsuccessfully looking for in the afternoon. I must add here that although I am not ordinarily thrifty I am very careful with paper and keep any scraps that can be used. It was obviously this practice of mine, which is nourished by an instinct, that enabled my forgetfulness to be corrected as soon as the immediate motive for it had disappeared.'

If a survey is made of cases of mislaying, it in fact becomes hard to believe that anything is ever mislaid except as a result of an unconscious intention.

(11) One day in the summer of 1901 I remarked to a friend with whom I used at that time to have a lively exchange of scientific ideas: 'These problems of the neuroses are only to be solved if we base ourselves wholly and completely on the assumption of the original bisexuality of the individual.' To which he replied: 'That's what I told you two and a half years ago at Br. when we went for that evening walk. But you wouldn't hear of it then.' It is painful to be requested in this way to surrender one's originality. I could not recall any such conversation or this pronouncement of my friend's. One of us must have been mistaken and on the '*cui prodest?*' principle¹ it must have been myself. Indeed, in the course of the next week I remembered the whole incident, which was just as my friend had tried to recall it to me; I even recollected the answer I had given him at the time: 'I've not accepted that yet; I'm not inclined to go into the question.' But since then I have grown a little more tolerant when, in reading medical literature, I come across one of the few ideas with which my name can be associated, and find that my name has not been mentioned.

Finding fault with one's wife, a friendship which has turned into its opposite, a doctor's error in diagnosis, a rebuff by some one with similar interests, borrowing someone else's ideas - it can hardly be accidental that a collection of instances of forgetting, gathered at random, should require me to enter into such distressing subjects in explaining them. On the contrary, I suspect that everyone who is willing to enquire into the motives behind his lapses of memory will be able to record a similar sample list of objectionable subjects. The tendency to forget what is disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless developed with different degrees of strength in different people. It is probable that many instances of *disowning* which we encounter in our medical work are to be traced to *forgetting*.¹ It is true that our view of such forgetting limits the distinction between the two forms of behaviour to purely psychological factors and allows us to see in both modes of reaction the expression of the same motive. Of all the numerous examples of the disavowal of unpleasant memories which I have observed on the part of relatives of patients, one remains in my recollection as especially singular. A mother was giving me information about the childhood of her neurotic son, now in his puberty, in the course of which she said that, like his brothers and sisters, he had been a bed-wetter till late on - a fact which is certainly of some significance in the case history of a neurotic patient. A few weeks later, when she was wanting to find out about the progress of the treatment, I had occasion to draw her attention to the signs of a constitutional disposition to illness on the young man's part, and in doing so I referred to the bed-wetting which she had brought out in the anamnesis. To my astonishment she contested this fact in regard both to him and to the other children, and asked me how I could know it. Finally I told her that she herself had informed me a short time before. She must therefore have forgotten it.²

¹ [Footnote added 1907:] If we ask someone whether he suffered from a luetic infection ten or fifteen years ago, we are too apt to overlook the fact that, from a psychical point of view, he will have regarded this illness quite differently from, let us say, an acute attack of rheumatism. - In the anamneses which parents give about their daughters' neurotic illnesses, it is hardly possible to distinguish with certainty between what has been forgotten and what is being concealed, since everything standing in the way of a girl's future marriage is systematically set aside, i.e. repressed, by the parents. - [Added 1910:] A man who had recently lost his dearly-loved wife from an affection of the lungs reported the following instance to me in which misleading answers given to the doctor's enquiries could only be ascribed to forgetting of this kind. 'As my poor wife's pleuritis had still not improved after many weeks, Dr. P. was called into consultation. In taking the anamnesis he asked the usual questions, including whether there were any cases of lung illness in my wife's family. My wife said there were none and I could not recall any either. As Dr. P. was leaving, the conversation turned, as though accidentally, to the subject of excursions and my wife said: "Yes, it's a long journey, too, to Langersdorf, where my poor brother's buried." This brother died about fifteen years ago after suffering for years from tuberculosis. My wife was very fond of him and often spoken to me about him. In fact it now occurred to me that at the time that her pleuritis was diagnosed she was very worried and remarked gloomily: "My brother died of a lung complaint too." But now, the memory was so strongly repressed that even after her remark about the excursion to Langersdorf she was not led to correct the information she had given about illnesses in her family. I myself became aware of the lapse of memory at the very moment she spoke of Langersdorf.' - [Added 1912:] A completely analogous experience is related by Jones in the work to which I have referred several times already. A physician, whose wife suffered from an abdominal complaint the diagnosis of which was uncertain, remarked by way of comforting her: 'It is fortunate at any rate that there has been no tuberculosis in your family.' 'Have you forgotten', answered his wife in the greatest astonishment, 'that my mother died of tuberculosis and that my sister recovered from it only after having been given up by the doctors?'

² In the days while I was engaged in writing these pages the following almost incredible instance of forgetting happened to me. On the first of January I was going through my medical engagement book so that I could send out my accounts. Under the month of June I came across the name 'M---I' but could not recall who it belonged to. My bewilderment grew when I turned the pages and discovered that I treated the case in a sanatorium and made daily visits over a period of weeks. A patient treated under such conditions cannot be forgotten by a doctor after scarcely six months. Could it have been a man, I asked myself, a case of general paralysis, an uninteresting case? Finally the record of the fees I had received brought back to me all the facts that had striven to escape my memory. M---I was a fourteen-year-old girl, the most remarkable case I had had in recent years, one which taught me a lesson I am not likely

The Psychopathology Of Everyday Life

ever to forget and whose outcome cost me moments of the greatest distress. The child fell ill of an unmistakable hysteria, which did in fact clear up quickly and radically under my care. After this improvement the child was taken away from me by her parents. She still complained of abdominal pains which had played the chief part in the clinical picture of her hysteria. Two months later she died of sarcoma of the abdominal glands. The hysteria, to which she was at the same time predisposed, used the tumour as a provoking cause, and I, with my attention held by the noisy but harmless manifestations of the hysteria, had perhaps overlooked the first signs of the insidious and incurable disease.

There are thus abundant signs to be found in healthy, non-neurotic people that the recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance.¹ But the full significance of this fact can be estimated only when the psychology of *neurotic* people is investigated. We are forced to regard as one of the main pillars of the mechanism supporting hysterical symptoms an *elementary endeavour* of this kind *to fend off* ideas that can arouse feelings of unpleasure - an endeavour which can only be compared with the flight-reflex in the presence of painful stimuli. The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect in every case, that in the interplay of psychical forces it may not come up against factors which, for other purposes, aim at the opposite effect and bring it about in spite of the defensive trend. It may be surmised that *the architectonic principle of the mental apparatus lies in a stratification - a building up of superimposed agencies*; and it is quite possible that this defensive endeavour belongs to a lower psychical agency and is inhibited by higher agencies. At all events, if we can trace back processes such as those found in our examples of forgetting to this defensive trend, that fact speaks in favour of its existence and power. (As we have seen, a number of things are forgotten on their own account; where this is not possible, the defensive trend shifts its target and causes something else related to the target at least to be forgotten, something less important which has come into associative connection with the thing that is really objectionable.

¹ [Footnote added 1910:] A. Pick (1905) has recently brought together a number of quotations from authors who appreciate the influence of affective factors on the memory and who - more or less clearly - recognize the contribution towards forgetting made by the endeavour to fend off unpleasure. But none of us has been able to portray the phenomenon and its psychological basis so exhaustively and at the same time so impressively as Nietzsche in one of his aphorisms (*Jenseits von Gut und Böse*, IV, 68): "I did this", says my Memory. "I cannot have done this", says my Pride and remains inexorable. In the end - Memory yields.'

The view developed here, that distressing memories succumb especially easily to motivated forgetting, deserves to find application in many spheres where no attention, or too little, has so far been paid to it. Thus it seems to me that it has still not yet been sufficiently strongly emphasized in assessing testimony in courts of law,¹ where the process of putting a witness on oath is clearly expected to have much too great a purifying influence on the play of his psychical forces. It is universally acknowledged that where the origin of a people's traditions and legendary history are concerned, a motive of this kind, whose aim is to wipe from memory whatever is distressing to national feeling, must be taken into consideration. Closer investigation would perhaps reveal a complete analogy between the ways in which the traditions of a people and the childhood memories of the individual come to be formed. - The great Darwin laid down a 'golden rule' for the scientific worker based on his insight into the part played by unpleasure as a motive for forgetting.²

In a very similar way to the forgetting of names, the forgetting of impressions can be accompanied by faulty recollection; and this, where it finds credence, is described as paramnesia. Paramnesia in pathological cases - in paranoia it actually plays the part of a constituent factor in the formation of the delusion - has brought forth an extensive literature in which I have entirely failed to find any hint whatever as to its motivation. As this is also a subject which belongs to the psychology of the neuroses it is inappropriate to consider it in the present context. Instead, I shall describe a singular paramnesia of my own, in which the motivation provided by unconscious, repressed material and the manner and nature of the connection with this material can be recognized clearly enough.

¹ Cf. Gross (1898).

² [*Footnote added 1912*] Ernest Jones has drawn attention to the following passage in Darwin's autobiography, which convincingly reflects his scientific honesty and his psychological acumen:

'I had, during many years, followed a golden rule, namely, that whenever a published fact, a new observation or thought came across me, which was opposed to my general results, to make a memorandum of it without fail and at once; for I had found by experience that such facts and thoughts were far more apt to escape from the memory than favourable ones.'

While I was writing the later chapters of my book on dream-interpretation, I happened to be at a summer resort without access to libraries and works of reference, and I was forced to incorporate in my manuscript from memory all sorts of references and quotations, subject to later correction. In writing the passage on day-dreams I thought of the excellent example of the poor book-keeper in Alphonse Daudet's *Le Nabab*, in whose person the writer was probably portraying his own reveries. I imagined I had a distinct memory of one of the phantasies which this man - I called him Monsieur Jocelyn - hatched out on his walks through the streets of Paris; and I began to reproduce it from memory. It was a phantasy of how Monsieur Jocelyn boldly threw himself at the head of a runaway horse in the street, and brought it to a stop; how the carriage door opened and a great personage stepped out, pressed Monsieur Jocelyn's hand and said: 'You are my saviour. I owe my life to you. What can I do for you?'

Any inaccuracies in my own account of this phantasy could, I assured myself, easily be corrected at home when I had the book in front of me. But when I finally looked through *Le Nabab* to check this passage in my manuscript, which was ready to go to press, I found, to my very great shame and consternation, no mention of any such reverie on the part of Monsieur Jocelyn; in fact the poor book-keeper did not have this name at all but was called Monsieur Joyeuse. This second error quickly gave me the key to the solution of the first one - the paramnesia. 'Joyeux', of which 'Joyeuse' is the feminine form, is the only possible way in which I could translate my own name, Freud, into French. Where then could the phantasy, which I had remembered wrongly and ascribed to Daudet, have come from? It could only be a product of my own, a day-dream which I had formed myself and which had not become conscious or which had once been conscious and had since been totally forgotten. Perhaps I invented it myself in Paris where I frequently walked about the streets, lonely and full of longings, greatly in need of a helper and protector, until the great Charcot took me into his circle. Later I more than once met the author of *Le Nabab* in Charcot's house.¹

¹ [Footnote added 1924:] Some time ago one of my readers sent me a small volume from Franz Hoffmann's *Jugendbibliothek* in which a rescue scene like the one in my phantasy in Paris is recounted in detail. The agreement between the two extends even to certain not quite ordinary expressions that occur in both. It is not easy to avoid suspecting that I had in fact read this children's book while I was myself a boy. The library at my secondary school contained Hoffmann's series and was always ready to offer these books to pupils in place of any other mental pabulum. The phantasy which, at the age of 43, I thought I remembered as having been produced by someone else, and which I was subsequently forced to recognize as a creation of my own at the age of 28, may therefore easily have been an exact reproduction of an impression which I had received somewhere between the ages of 11 and 13. After all, the rescue phantasy which I attributed to the unemployed book-keeper in *Le Nabab* was merely meant to prepare the way for the phantasy of my own rescue, to make my longing for a patron and protector tolerable to my pride. This being so, it will not surprise anyone with an understanding of the mind to hear that in my conscious life I myself was highly resistant to the idea of being dependent on a protector's favour, and that I found it hard to tolerate the few real situations in which something of that nature occurred. Abraham (1922b) has brought to light the deeper meaning of phantasies with such a content and has provided an almost exhaustive explanation of their special features.

Another paramnesia, which it was possible to explain satisfactorily, is reminiscent *fausse reconnaissance*, a subject that will be discussed later. I had told one of my patients, an ambitious and capable man, that a young student had recently gained admittance to the circle of my followers on the strength of an interesting work, '*Der Künstler, Versuch einer Sexualpsychologie*'. When this work appeared in print a year and a quarter later, my patient maintained that he could remember with certainty having read an announcement of this book somewhere (perhaps in a bookseller's prospectus) even before - a month or six months before - I had first mentioned it to him. This announcement, he said, had come into his mind at the time; and he further remarked that the author had changed the title: it no longer read '*Versuch*' but '*Ansätze zu einer Sexualpsychologie*'. Careful enquiry of the author and a comparison of all the dates nevertheless showed that my patient was claiming to recall something impossible. No announcement of this work had appeared anywhere before publication, and certainly none a year and a quarter before it went to press. When I omitted to interpret this paramnesia, my patient produced a repetition of it of the same kind. He believed he had recently seen a work on agoraphobia in a bookshop window and was now looking through all the publishers' catalogues in order to get a copy. I was then able to explain to him why his efforts were bound to be fruitless. The work on agoraphobia existed only in his phantasy, as an unconscious intention: he meant to write it himself. His ambition to emulate the young man and become one of my followers on the strength of a similar scientific work was responsible for the first paramnesia and then for its repetition. Whereupon he recalled that the bookseller's announcement which had led him to make this false recognition dealt with a work entitled '*Genesis, das Gesetz der Zeugung*'. However, it was I who was responsible for the change in the title mentioned by him, for I could remember having myself been guilty of that inaccuracy - '*Versuch*' instead of '*Ansätze*' - in repeating the title.

(B) THE FORGETTING OF INTENTIONS

No group of phenomena is better qualified than the forgetting of intentions for demonstrating the thesis that, in itself, lack of attention does not suffice to explain parapraxes. An intention is an impulse to perform an action: an impulse which has already found approval but whose execution is postponed to a suitable occasion. Now it can happen that during the interval thus created a change of such a kind occurs in the motives involved that the intention is not carried out; but in that case it is not forgotten: it is re-examined and cancelled. The *forgetting* of intentions, to which we are subject every day and in every possible situation, is *not* a thing that we are in the habit of explaining in terms of such a revision in the balance of motives. In general we leave it unexplained; or we try to find a psychological explanation by supposing that at the time when the intention was due to be carried out the attention necessary for the action was no longer at hand - attention which was, after all, an indispensable precondition for the coming into being of the intention and had therefore been available for the action at that time. Observation of our normal behaviour in regard to intentions leads us to reject this attempt at an explanation as being arbitrary. If I form an intention in the morning which is to be carried out in the evening, I may be reminded of it two or three times in the course of the day. It *need* not however become conscious at all throughout the day. When the time for its execution draws near, it suddenly springs to my mind and causes me to make the necessary preparations for the proposed action. If I am going for a walk and take a letter with me which has to be posted, it is certainly not necessary for me, as a normal individual, free from neurosis, to walk all the way with it in my hand and to be continually on the look-out for a letter-box in which to post it; on the contrary I am in the habit of putting it in my pocket, of walking along and letting my thoughts range freely, and I confidently expect that one of the first letter-boxes will catch my attention and cause me to put my hand in my pocket and take out the letter. Normal behaviour after an intention has been formed coincides fully with the experimentally-produced behaviour of people to whom what is described as a 'post-hypnotic suggestion at long range' has been given under hypnosis.¹ This phenomenon is usually described in the following way. The suggested intention slumbers on in the person concerned until the time for its execution approaches. Then it awakes and impels him to perform the action.

¹ Cf. Bernheim (1891).

There are two situations in life in which even the layman is aware that forgetting - as far as intentions are concerned - cannot in any way claim to be considered as an elementary phenomenon not further reducible, but entitles him to conclude that there are such things as *unavowed motives*. What I have in mind are love-relationships and military discipline. A lover who has failed to keep a *rendezvous* will find it useless to make excuses for himself by telling the lady that unfortunately he completely forgot about it. She will not fail to reply: 'A year ago you wouldn't have forgotten. You evidently don't care for me any longer.' Even if he should seize on the psychological explanation mentioned above and try to excuse his forgetfulness by pleading pressure of business, the only outcome would be that the lady, who will have become as sharp-sighted as a doctor is in psycho-analysis, would reply: 'How curious that business distractions like these never turned up in the past!' The lady is not of course wanting to deny the possibility of forgetting; it is only that she believes, not without reason, that practically the same inference - of there being some reluctance present - can be drawn from unintentional forgetting as from conscious evasion.

Similarly, under conditions of military service, the difference between a failure to carry out orders which is due to forgetting and one which is deliberate is neglected on principle - and justifiably so. A soldier *must* not forget what military service orders him to do. If he *does* forget in spite of knowing the order, that is because the motives that drive him to carry out the military order are opposed by other, counter-motives. A one year volunteer who at inspection tries to offer the excuse that he has *forgotten* to polish his buttons is sure to be punished. But this punishment is trifling in comparison to the one to which he would expose himself if he admitted to himself and his superiors that the motive for his failure to carry out orders was that 'I'm heartily sick of this wretched spit-and-polish'. For the sake of this saving of punishment - for reasons of economy, so to speak - he makes use of forgetting as an excuse, or it comes about as a compromise.

Both the service of women and military service demand that everything connected with them should be immune to forgetting. In this way they suggest the notion that, whereas in unimportant matters forgetting is permissible, in important matters it is a sign that one wishes to treat them as unimportant, i.e. to deny their importance.¹ This view, which takes psychical considerations into account, cannot in fact be rejected here. No one forgets to carry out actions that seem to himself important, without incurring suspicion of being mentally disordered. Our investigation can therefore only extend to the forgetting of intentions of a more or less minor character; we cannot consider any intention as being *wholly* indifferent, for otherwise it would certainly never have been formed.

As with the functional disturbances described on earlier pages, I have made a collection of the cases of omitting to do something as a result of forgetting which I have observed in myself, and I have endeavoured to explain them. I have invariably found that they could be traced to interference by unknown and unavowed motives - or, as one may say, to a *counter-will*. In a number of these cases I found myself in a position which was similar to being under conditions of service; I was under a constraint, against which I had not entirely given up struggling, so that I made a demonstration against it by forgetting. This accounts for the fact that I am especially prone to forget to send congratulations on occasions such as birthdays, anniversaries, wedding celebrations and promotions. I keep on making new resolutions on the subject and become more and more convinced that I shall not succeed. I am now on the point of giving the effort up and of yielding consciously to the motives that oppose it. While I was in a transitional stage, a friend asked me to send a congratulatory telegram on a certain day on his behalf along with my own, but I warned him that I should forget both; and it was not surprising that the prophecy came true. It is due to painful experiences in the course of my life that I am unable to manifest sympathy on occasions where the expression of sympathy must necessarily be exaggerated, as an expression corresponding to the slight amount of my feeling would not be allowable. Since I have come to recognize that I have often mistaken other people's ostensible sympathy for their real feelings, I have been in revolt against these conventional expressions of sympathy, though on the other hand I recognize their social usefulness. Condolences in the case of death are excepted from this divided treatment: once I have decided to send them I do not fail to do so. Where my emotional activity no longer has anything to do with social duty, its expression is never inhibited by forgetting.

¹ [Footnote added 1912:] In Bernard Shaw's play *Caesar and Cleopatra*, Caesar, as he is leaving Egypt, is worried for a time by the idea that there is something he has meant to do but has forgotten. Finally he remembers: he has forgotten to say goodbye to Cleopatra! This small detail is meant to illustrate - incidentally in complete contrast to the historical truth - how little Caesar cared for the young Egyptian princess. (From Jones, 1911*b*, 488 *n*.)

Writing from a prisoner-of-war camp, Lieutenant T. reports an instance of a forgetting of this kind, in which an intention that had in the first place been suppressed broke through in the form of 'counter-will' and led to an unpleasant situation:

'The most senior officer in a prisoner-of-war camp for officers was insulted by one of his fellow prisoners. To avoid further complications he wished to use the only authoritative measure at his disposal and have the officer removed and transferred to another camp. It was only on the advice of several friends that he decided - contrary to his secret wish - to abandon his plan and seek to satisfy his honour immediately, although this was bound to have a variety of disagreeable results. The same morning, as senior officer, he had to call the roll of the officers, under the supervision of the camp-guard. He had known his fellow officers for quite a long time and had never before made any mistakes over this. This time he passed over the name of the man who had insulted him, with the result that when all the others had been dismissed this man alone was obliged to remain behind till the error was cleared up. The name that had been overlooked was perfectly plainly written in the middle of a sheet. The incident was regarded by one party as a deliberate insult, and by the other as an unfortunate accident that was likely to be misinterpreted. Later on, however, after making the acquaintance of Freud's *Psychopathology of Everyday Life*, the chief actor in the episode was able to form a correct picture of what had occurred.'

The conflict between a conventional duty and the unavowed view which we privately take of it similarly provides an explanation for those cases in which we forget to carry out actions that we promised to do as a favour to someone. Here the regular result is that it is only the would-be benefactor who believes that forgetting has the power to act as an excuse; the person who asked the favour gives what is unquestionably the right answer: 'He is not interested in the matter, otherwise he would not have forgotten.' There are some people who are known as being forgetful in general, and who are for that reason excused their lapses in the same kind of way as short-sighted people who fail to greet us in the street.¹ These people forget all their small promises, and they fail to carry out any of the commissions they receive. In this way they show themselves unreliable in little things, and they demand that we should not take these minor offences amiss - that is, that we should not attribute them to their character but refer them to an organic idiosyncrasy.² I am not one of these people myself, and have had no opportunity of analysing the actions of a person of this kind, so that, by examining the choice of occasions for forgetting, I might discover its motivation. I cannot however help suspecting on the basis of analogy that in these cases the motive is an unusually large amount of unavowed contempt for other people which exploits the constitutional factor for its own ends.³

¹ Women, with their subtler understanding of unconscious mental processes, are as a rule more apt to take offence when someone does not recognize them in the street and therefore fails to greet them, than to think of the most obvious explanations - namely that the offender is short-sighted, or was so engrossed in his thoughts that he did not notice them. They conclude that he would have seen them if he had 'set any store by them'.

² [Footnote added 1910:] Ferenczi reports that he himself was once an 'absent-minded person' [*ein 'Zerstreuter'*] and that he was noted by acquaintances for the frequency and strangeness of his parapraxes. But, he says, the signs of this absent-mindedness have almost completely disappeared since he began treating patients by psycho-analysis and found himself obliged to turn his attention to the analysis of his own self as well. He thinks that one gives up these parapraxes in proportion as one learns to enlarge one's own responsibility. He therefore justly maintains that absent-mindedness is a condition which is dependent on unconscious complexes and which can be cured by psycho-analysis. One day, however, he was blaming himself for having committed a technical error in a patient's psycho-analysis. That day all his former absent-minded habits reappeared. He stumbled several times as he walked along the street (a representation of his *faux pas* [false step - blunder] in the treatment), left his pocket book at home, tried to pay a kreutzer too little for his tram-fare, found his clothes were not properly buttoned, and so on.

³ [Footnote added 1912:] In this connection Ernest Jones observes: 'Often the resistance is of a general order. Thus a busy man forgets to post letters entrusted to him - to his slight annoyance - by his wife, just as he may "forget" to carry out her shopping orders.'

In other cases the motives for forgetting are less easy to discover, and when found arouse greater surprise. Thus, for instance, in former years I noticed that, out of a fairly large number of visits to patients, I only forgot those to non-paying patients or to colleagues. My shame at this discovery led me to adopt the habit of making a note beforehand in the morning of the visits I intended to make during the day. I do not know if other doctors have arrived at the same practice by the same road. But in this way we get some idea of what causes the so called neurasthenic patient to jot down, in his notorious 'notes', the various things he wants to tell the doctor. The ostensible reason is that he has no confidence in the reproductive capacity of his memory. That is perfectly correct, but the scene usually proceeds as follows. The patient has recounted his various complaints and enquiries in a very long-winded manner. After he has finished he pauses for a moment, then pulls out the jottings and adds apologetically: 'I've made some notes, as I can't remember things.' As a rule he finds that they contain nothing new. He repeats each point and answers it himself: 'Yes, I've asked about that already.' With the notes he is probably only demonstrating one of his symptoms: the frequency with which his intentions are disturbed through the interference of obscure motives.

I pass on to ailments that afflict the greater number of my healthy acquaintances as well as myself. I confess that - especially in former years - I was very apt to forget to return borrowed books, which I kept for long periods, and that it came about especially easily that I put off paying bills by forgetting them. One morning not long ago I left the tobacconist's where I had made my daily purchase of cigars without having paid for them. It was a most harmless omission, as I am well known there and could therefore expect to be reminded of my debt next day. But my trivial act of negligence, my attempt to contract a debt, was certainly not unconnected with budgetary thoughts which had occupied my mind during the preceding day. Among the majority even of what are called 'respectable' people traces of divided behaviour can easily be observed where money and property are concerned. It may perhaps be generally true that the primitive greed of the suckling, who wants to take possession of every object (in order to put it into his mouth), has only been incompletely overcome by civilization and upbringing.¹

¹ For the sake of preserving the unity of the subject I may perhaps interrupt the general arrangement I have adopted, and, in addition to what I have said above, point out that people's memories show a particular partiality in money matters. Paramnesias of having already paid for something can often be very obstinate, as I know from my own experience. When free play is given to avaricious aims apart from the serious interests of life - for fun, in fact -, as in card-playing, the most honourable men show an inclination to make errors and mistakes in memory and counting, and, without quite knowing how, they even find themselves involved in petty cheating. The psychically refreshing nature of these games is partly due to liberties of this kind. We must admit the truth of the saying that in play we can get to know a person's character - that is, if we are not thinking of his *manifest* character. - If waiters still make unintentional mistakes in the bill, the same explanation obviously applies to them. - In commercial circles a certain delay can frequently be observed in paying out sums of money (for settling accounts and so on) which in point of fact brings the owner no profit and can only be understood in psychological terms - as an expression of a counter-will against paying out money. - [*The next sentence was added in 1912:*] Brill puts the matter with epigrammatic brevity: 'We are more apt to mislay letters containing bills than cheques.' - The fact that women in particular evince a special amount of unpleasure at paying their doctor is connected with the most intimate impulses, which are very far from having been elucidated. Women patients have usually forgotten their purse and so cannot pay at the time of consultation; they then regularly forget to send the fee after they reach home, and thus arrange things so that one has treated them for nothing - 'for the sake of their *beaux yeux*'. They pay one, as it were, by the sight of their countenance.

I am afraid all the examples I have given up to now will seem merely commonplace. But after all it can only suit my aim if I come upon things that are familiar to everyone and that everyone understands in the same way, for my whole purpose is to collect everyday material and turn it to scientific use. I fail to see why the wisdom which is the precipitate of men's common experience of life should be refused inclusion among the acquisitions of science. The essential character of scientific work derives not from the special nature of its objects of study but from its stricter method of establishing the facts and its search for far-reaching correlations.

Where intentions of some importance are concerned, we have found in general that they are forgotten when obscure motives rise against them. In the case of rather less important intentions we can recognize a second mechanism of forgetting: a counter-will is transferred to the intention from some other topic, after an external association has been formed between the other topic and the content of the intention. Here is an example. I set store by high-quality blotting paper and I decided one day to buy a fresh supply that afternoon in the course of my walk to the Inner Town. But I forgot for four days running, till I asked myself what reason I had for the omission. It was easy to find after I had recalled that though I normally *write* 'Löschpapier' I usually *say* 'Fliesspapier'. 'Fliess' is the name of a friend in Berlin who had on the days in question given me occasion for a worrying and anxious thought. I could not rid myself of this thought, but the defensive tendency (cf. above, p. 1230) manifested itself by transferring itself, by means of the verbal similarity, to the indifferent intention which on account of its indifference offered little resistance.

Direct counter-will and more remote motivation are found together in the following example of dilatoriness. I had written a short pamphlet *On Dreams* (1901a), summarizing the subject-matter of my *Interpretation of Dreams*, for the series *Grenzfragen des Nerven- und Seelenlebens*. Bergmann of Wiesbaden had sent me the proofs, and had asked for them back by return of post, as the book was to be issued before Christmas. I corrected the proofs the same night and placed them on my desk so as to take them with me next morning. In the morning I forgot about them, and only remembered them in the afternoon when I saw the wrapper on my desk. In the same way I forgot the proofs that afternoon, that evening and the following morning, till I pulled myself together and took them to a letter-box on the afternoon of the second day, wondering what could be the reason for my procrastination. It was obvious that I did not want to send them off, but I could not discover why. However, in the course of the same walk I called in at my publisher's in Vienna - the firm that had published my *Interpretation of Dreams*, I placed an order for something and then said, as if impelled by a sudden thought: 'I suppose you know I've written the dream-book over again?' - 'Oh, you can't mean that!' he said. 'Don't be alarmed', I replied; 'it's only a short essay for the Löwenfeld-Kurella series.' But he was still not satisfied; he was worried that the essay would interfere with the sales of the book. I disagreed with him and finally asked: 'If I'd come to you before, would you have forbidden my publishing it?' - 'No, I certainly wouldn't.' Personally I believe I acted quite within my rights and did nothing contrary to common practice; nevertheless it seems certain that a misgiving similar to that expressed by the publisher was the motive for my delay in sending back the proofs. This misgiving goes back to an earlier occasion, on which a different publisher raised difficulties when it seemed unavoidable for me to introduce unaltered a few pages from an earlier work of mine on children's palsies published by another firm, into my monograph on the same subject in Nothnagel's *Handbuch*. But in this case, as well, the reproach was not justified; this time, too, I had loyally informed my first publisher (the same one who published *The Interpretation of Dreams*) of my intention. However, if this chain of memories is followed back still further, it brings to light an even earlier occasion involving a translation from the French, in which I really did infringe the rights of property that apply to publications. I added notes to the text which I translated, without asking the author's permission, and some years later had reason to suspect that the author was displeased with my arbitrary action.

There is a proverb which reveals the popular knowledge that the forgetting of intentions is not accidental: 'If one forgets to do a thing once, one will forget to do it many times more.'

Indeed, sometimes we cannot avoid an impression that everything that can be said about forgetting and about parapraxes is already familiar and self-evident to everyone. It is sufficiently surprising that it is nevertheless necessary to present to consciousness things that are so well-known. How often have I heard people say: 'Don't ask me to do that, I'm certain to forget it!' There is surely nothing mystical, then, if this prophecy is subsequently fulfilled. A person who talks in this way senses an intention not to carry out the request, and is merely refusing to admit it to himself.

Much light is thrown, moreover, on the forgetting of intentions by what may be called 'the forming of spurious intentions'. I once promised a young author that I would write a review of his short work; but because of internal resistances, which I knew about, I put off doing so, till one day I yielded to pressure from him and promised it would be done that same evening. I really had seriously meant to do it then, but I had forgotten that I had set the evening aside for preparing a specialist report that could not be deferred. After this had shown me that my intention had been spurious, I gave up the struggle against my resistances and refused the author's request.

CHAPTER VIII

BUNGLED ACTIONS

I will quote another passage from the work by Meringer and Mayer (1895, 98) which I have already mentioned:

'Slips of the tongue are not without their parallels. They correspond to the slips which often occur in other human activities and which are known by the somewhat foolish name of "oversights".'

Thus I am by no means the first to surmise that there is sense and purpose behind the minor functional disturbances in the daily life of healthy people.¹

If slips in speaking - which is clearly a motor function - can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term 'bungled actions' [*Vergreifen*] to describe all the cases in which a wrong result - i.e. a deviation from what was intended - seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena. It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'. Let us rather try to trace the individual examples back to their particular determinants. For this purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.

¹ [Footnote added 1910:] A second publication by Meringer has later shown me how great an injustice I did to that author when I credited him with any such understanding.

(a) In former years I visited patients in their homes more frequently than I do at present; and on numerous occasions when I was at the front door, instead of knocking or ringing the bell, I pulled my own latch key out of my pocket, only to thrust it back again in some confusion. When I consider the patients at whose houses this happened, I am forced to think that the parapraxis - taking out my key instead of ringing the bell - was in the nature of a tribute to the house where I made the mistake. It was equivalent to the thought 'Here I feel I am at home', for it only occurred at places where I had taken a liking to the patient. (Of course I never ring my own door bell.)

Thus the parapraxis was a symbolic representation of a thought which was not after all really intended to be accepted seriously and consciously; for a nerve specialist is in fact well aware that his patients remain attached to him only so long as they expect to be benefited by him, and that he in turn allows himself to feel an excessively warm interest in them only with a view to giving them psychical help.

Numerous self-observations made by other people show that handling a key in this significantly incorrect way is certainly not a peculiarity of mine.

Maeder (1906) describes what is an almost identical repetition of my experiences: 'Il est arrivé à chacun de sortir son trousseau, en arrivant à la porte d'un ami particulièrement cher, de se surprendre pour ainsi dire, en train d'ouvrir avec sa clé comme chez soi. C'est un retard, puisqu'il faut sonner malgré tout, mais c'est une preuve qu'on se sent - ou qu'on voudrait se sentir - comme chez soi, auprès de cet ami.'¹

¹ ['Everyone has had the experience of taking out his bunch of keys on reaching the door of a particularly dear friend, of catching himself, as it were, in the act of opening it with his key just as if he was at home. This causes a delay, as he has to ring the bell in the long run, but it is a sign that he feels - or would like to feel - at home with this friend.']

Jones (1911*b*, 509): 'The use of keys is a fertile source of occurrences of this kind, of which two examples may be given. If I am disturbed in the midst of some engrossing work at home by having to go to the hospital to carry out some routine work, I am very apt to find myself trying to open the door of my laboratory there with the key of my desk at home, although the two keys are quite unlike each other. The mistake unconsciously demonstrates where I would rather be at the moment.

'Some years ago I was acting in a subordinate position at a certain institution, the front door of which was kept locked, so that it was necessary to ring for admission. On several occasions I found myself making serious attempts to open the door with my house key. Each one of the permanent visiting staff, to which I aspired to be a member, was provided with a key, to avoid the trouble of having to wait at the door. My mistakes thus expressed my desire to be on a similar footing, and to be quite "at home" there.'

Dr. Hanns Sachs reports a similar experience: 'I always have two keys on me, one for the door of my office and one for my flat. They are not at all easily confused with each other, for the office key is at least three times as big as the flat key. Moreover, I carry the former in my trouser pocket and the latter in my waistcoat pocket. Nevertheless it often happened that I noticed as I stood at the door that I had got out the wrong key on the stairs. I determined to make a statistical experiment. Since I stood in front of both the doors every day in more or less the same emotional state, the confusion between the two keys was bound to show a regular tendency, if, indeed, it was true that it had some psychical determinant. My observation of later instances then showed that I quite regularly took out my flat key at the door of the office, whereas the opposite happened only once. I came home tired, knowing that a guest would be waiting for me there. When I reached the door I made an attempt to unlock it with the office key - which was of course much too large.'

(b) There is a house where twice every day for six years, at regular hours, I used to wait to be let in outside a door on the second floor. During this long period it has happened to me on two occasions, with a short interval between them, that I have gone a floor too high - i.e. I have '*climbed too high*'.¹ On the first occasion I was enjoying an ambitious day-dream in which I was 'climbing ever higher and higher'. On this occasion I even failed to hear that the door in question had opened as I put my foot on the first step of the third flight. On the other occasion, I again went too far while I was deep in thought; when I realized it, I turned back and tried to catch hold of the phantasy in which I had been absorbed. I found that I was irritated by a (phantasied) criticism of my writings in which I was reproached with always 'going too far'. This I had now replaced by the not very respectful expression 'climbing too high'.

(c) For many years a reflex hammer and a tuning fork have been lying side by side on my writing table. One day I left in a hurry at the end of my consulting hour as I wanted to catch a particular suburban train; and in broad daylight I put the tuning fork in my coat pocket instead of the hammer. The weight of the object pulling down my pocket drew my attention to my mistake. Anyone who is not in the habit of giving consideration to such minor occurrences will doubtless explain and excuse the mistake by pointing to the haste of the moment. Nevertheless I preferred to ask myself the question why it actually was that I took the tuning fork instead of the hammer. My haste could just as well have been a motive for picking up the right object so as not to have to waste time in correcting my mistake.

'Who was the last person to take hold of the tuning fork?' was the question that sprang to my mind at that point. It was an *imbecile* child, whom I had been testing some days before for his attention to sensory impressions; and he had been so fascinated by the tuning fork that I had had some difficulty in tearing it away from him. Could the meaning be, then, that I was an imbecile? It certainly seemed so, for my first association to 'hammer' was '*Chamer*' (Hebrew for 'ass').

¹ [The German '*versteigen*' would, on the analogy of '*verlesen*', '*verschreiben*', etc., mean 'to mis-climb'; but its normal meaning is 'to climb too high' or, figuratively, 'to over-reach oneself'.]

But why this abusive language? At this point we must look into the situation. I was hurrying to a consultation at a place on the Western railway line, to visit a patient who, according to the anamnesis I had received by letter, had fallen from a balcony some months earlier and had since then been unable to walk. The doctor who called me in wrote that he was nevertheless uncertain whether it was a case of spinal injury or of a traumatic neurosis - hysteria. That was what I was now to decide. It would therefore be advisable for me to be particularly wary in the delicate task of making a differential diagnosis. As it is, my colleagues are of the opinion that I make a diagnosis of hysteria far too carelessly where graver things are in question. But so far this did not justify the abusive language. Why, of course! it now occurred to me that the little railway station was at the same place at which some years before I had seen a young man who had not been able to walk properly after an emotional experience. At the time I made a diagnosis of hysteria and I subsequently took the patient on for psychical treatment. It then turned out that though my diagnosis had not, it is true, been incorrect, it had not been correct either. A whole number of the patient's symptoms had been hysterical, and they rapidly disappeared in the course of treatment. But behind these a remnant now became visible which was inaccessible to my therapy; this remnant could only be accounted for by multiple sclerosis. It was easy for those who saw the patient after me to recognize the organic affection. I could hardly have behaved otherwise or formed a different judgement, yet the impression left was that a grave error had been made; the promise of a cure which I had given him could naturally not be kept.

The error of picking up the tuning fork instead of the hammer could thus be translated into words as follows; 'You idiot! you ass! Pull yourself together this time, and see that you don't diagnose hysteria again where there's an incurable illness, as you did years ago with the poor man from that same place!' And fortunately for this little analysis, if not fortunately for my mood, the same man, suffering from severe spastic paralysis, had visited me during my consulting hour a few days before, and a day after the imbecile child.

It will be observed that this time it was the voice of self-criticism which was making itself heard in the bungled action. A bungled action is quite specially suitable for use in this way as a self-reproach: the present mistake seeks to represent the mistake that has been committed elsewhere.

(d) Bungled actions can, of course, also serve a whole number of other obscure purposes. Here is a first example. It is very rare for me to break anything. I am not particularly dextrous but a result of the anatomical integrity of my nerve-muscle apparatus is that there are clearly no grounds for my making clumsy movements of this kind, with their unwelcome consequences. I cannot therefore recall any object in my house that I have ever broken. Shortage of space in my study has often forced me to handle a number of pottery and stone antiquities (of which I have a small collection) in the most uncomfortable positions, so that onlookers have expressed anxiety that I should knock something down and break it. That however has never happened. Why then did I once dash the marble cover of my plain inkpot to the ground so that it broke?

My inkstand is made out of a flat piece of Untersberg marble which is hollowed out to receive the glass inkpot; and the inkpot has a cover with a knob made of the same stone. Behind this inkstand there is a ring of bronze statuettes and terra cotta figures. I sat down at the desk to write, and then moved the hand that was holding the pen-holder forward in a remarkably clumsy way, sweeping on to the floor the inkpot cover which was lying on the desk at the time.

The explanation was not hard to find. Some hours before, my sister had been in the room to inspect some new acquisitions. She admired them very much, and then remarked: 'Your writing table looks really attractive now; only the inkstand doesn't match. You must get a nicer one.' I went out with my sister and did not return for some hours. But when I did I carried out, so it seems, the execution of the condemned inkstand. Did I perhaps conclude from my sister's remark that she intended to make me a present of a nicer inkstand on the next festive occasion, and did I smash the unlovely old one so as to force her to carry out the intention she had hinted at? If that is so, my sweeping movement was only apparently clumsy; in reality it was exceedingly adroit and well-directed, and understood how to avoid damaging any of the more precious objects that stood around.

It is in fact my belief that we must accept this judgement for a whole series of seemingly accidental clumsy movements. It is true that they make a show of something violent and sweeping, like a spastic-atactic movement, but they prove to be governed by an intention and achieve their aim with a certainty which cannot in general be credited to our conscious voluntary movements. Moreover they have both features - their violence and their unerring aim - in common with the motor manifestations of the hysterical neurosis, and partly, too, with the motor performances of somnambulism. This fact indicates that both in these cases and in the movements under consideration the same unknown modification of the innervatory process is present.

Another self-observation, reported by Frau Lou Andreas-Salomé, may give a convincing demonstration of how obstinate persistence in an act of 'clumsiness' serves unavowed purposes in a far from clumsy way:

'Just at the time when milk had become scarce and expensive I found that I let it boil over time and time again, to my constant horror and vexation. My efforts to get the better of this were unsuccessful, though I cannot by any means say that on other occasions I have proved absent minded or inattentive. I should have had more reason to be so after the death of my dear white terrier (who deserved his name of "Druzhok" - the Russian for "Friend" - as much as any human being ever did). But - lo and behold! - never since his death has even a drop of milk boiled over. My first thought about this ran: "That's lucky, for the milk spilt over on to the hearth or floor wouldn't even be of any use!" And in the same moment I saw my "Friend" before my eyes, sitting eagerly watching the cooking, his head cocked a little to one side, his tail wagging expectantly, waiting in trustful confidence for the splendid mishap that was about to occur. And now everything was clear to me, and I realized too that I had been even *more* fond of him than I myself was aware.'

In the last few years, during which I have been collecting such observations, I have had a few more experiences of smashing or breaking objects of some value, but the investigation of these cases has convinced me that they were never the result of chance or of unintentional clumsiness on my part. One morning, for example, when I was passing through a room in my dressing-gown with straw slippers on my feet, I yielded to a sudden impulse and hurled one of my slippers from my foot at the wall, causing a beautiful little marble Venus to fall down from its bracket. As it broke into pieces, I quoted quite unmoved these lines from Busch:

'Ach! die Venus ist perdü -
Klickeradoms! - von Medici!'¹

This wild conduct and my calm acceptance of the damage are to be explained in terms of the situation at the time. One of my family was gravely ill, and secretly I had already given up hope of her recovery. That morning I had learned that there had been a great improvement, and I know I had said to myself: 'So she's going to live after all!' My attack of destructive fury served therefore to express a feeling of gratitude to fate and allowed me to perform a '*sacrificial act*' - rather as if I had made a vow to sacrifice something or other as a thank-offering if she recovered her health! The choice of the Venus of Medici for this sacrifice was clearly only a gallant act of homage towards the convalescent; but even now it is a mystery to me how I made up my mind so quickly, aimed so accurately and avoided hitting anything else among the objects so close to it.

Another case of breaking something, for which I once again made use of a pen-holder that slipped from my hand, likewise had the significance of a sacrifice; but on this occasion it took the form of a propitiatory sacrifice to avert evil. I had once seen fit to reproach a loyal and deserving friend on no other grounds than the interpretation I placed on certain indications coming from his unconscious. He was offended and wrote me a letter asking me not to treat my friends psycho-analytically. I had to admit he was in the right, and wrote him a reply to pacify him. While I was writing this letter I had in front of me my latest acquisition, a handsome glazed Egyptian figure. I broke it in the way I have described, and then immediately realized that I had caused this mischief in order to avert a greater one. Luckily it was possible to cement both of them together - the friendship as well as the figure - so that the break would not be noticed.

¹ ['Oh! the Venus! Lost is she!
Klickeradoms! of Medici!']

A third breakage was connected with less serious matters; it was only the disguised 'execution' - to borrow an expression from Vischer's *Auch Einer* - of an object which no longer enjoyed my favour. For some time I used to carry a stick with a silver handle. On one occasion the thin metal got damaged, through no fault of mine, and was badly repaired. Soon after the stick came back, I used the handle in a mischievous attempt to catch one of my children by the leg - with the natural result that it broke, and I was thus rid of it.

The equanimity with which we accept the resulting damage in all these cases can no doubt be taken as evidence that there is an unconscious purpose behind the performance of these particular actions.

In investigating the reasons for the occurrence of even so trivial a parapraxis as the breaking of an object, one is liable to come across connections which, besides relating to a person's present situation, lead deep into his prehistory. The following analysis by Jekels (1913) may serve as an example:

'A doctor had in his possession an earthenware flower vase which, though not valuable, was of great beauty. It was among the many presents - including objects of value - which had been sent to him in the past by a (married) woman patient. When a psychosis became manifest in her, he restored all the presents to her relatives - except for this far less expensive vase, with which he could not bear to part, ostensibly because it was so beautiful. But this embezzlement cost a man of his scrupulousness a considerable internal struggle. He was fully aware of the impropriety of his action, and only managed to overcome his pangs of conscience by telling himself that the vase was not in fact of any real value, that it was too awkward to pack, etc. - Some months later he was on the point of getting a lawyer to claim and recover the arrears (which were in dispute) of the fees for the treatment of this same patient. Once again the self-reproaches made their appearance; and he suffered some momentary anxiety in case the relatives discovered what could be called his embezzlement and brought it against him during the legal proceedings. For a while indeed the first factor (his self-reproaches) was so strong that he actually thought of renouncing all claims on a sum of perhaps a hundred times the value of the vase - a compensation, as it were, for the object he had appropriated. However, he at once got the better of the notion and set it aside as absurd.

‘While he was still in this mood he happened to be putting some fresh water in the vase; and despite the extreme infrequency with which he broke anything and the good control that he had over his muscular apparatus, he made an extraordinarily "clumsy" movement - one that was not in the least organically related to the action he was carrying out - which knocked the vase off the table, so that it broke into some five or six largish pieces. What is more, this was after he had made up his mind on the previous evening, though not without considerable hesitation, to put precisely this vase, filled with flowers, on the dining-room table before his guests. He had remembered it only just before it got broken, had noticed with anxiety that it was not in his living-room and had himself brought it in from the other room. After his first moments of dismay he picked up the pieces and by putting them together was just deciding that it would still be possible to make an almost complete repair of the vase, when the two or three larger fragments slipped from his hand; they broke into a thousand splinters, and with that vanished all hope for the vase.

‘There is no doubt that this parapraxis had the current purpose of assisting the doctor in his law-suit, by getting rid of something which he had kept back and which to some extent prevented his claiming what had been kept back from him.

'But apart from this direct determinant, every psycho-analyst will see in the parapraxis a further and much deeper and more important *symbolic* determinant; for a vase is an unmistakable symbol of a woman.

'The hero of this little story had lost his young, beautiful and dearly-loved wife in a tragic manner. He fell ill of a neurosis whose main theme was that he was to blame for the misfortune ("he had broken a lovely vase"). Moreover, he had no further relations with women and took a dislike to marriage and lasting love-relationships, which unconsciously he thought of as being unfaithful to his dead wife but which he consciously rationalized in the idea that he brought misfortune to women, that a woman might kill herself on his account, etc. (Hence his natural reluctance to keep the vase permanently!)

'In view of the strength of his libido it is therefore not surprising that the most adequate relationships appeared to him to be those - transient from their very nature - with married women (hence his keeping back of another person's vase).

'This symbolism is neatly confirmed by the two following factors. Because of his neurosis he entered psycho-analytic treatment. In the course of the session in which he gave an account of breaking the "earthenware" vase, he happened much later to be talking once more about his relations with women and said he thought he was quite unreasonably hard to please; thus for example he required women to have "unearthly beauty". This is surely a very clear indication that he was still dependent on his (dead, i. e., unearthly) wife and wanted to have nothing to do with "earthly beauty"; hence the breaking of the earthenware ("earthly") vase.

'And at the exact time when in the transference he formed a phantasy of marrying his physician's daughter, he made him a present of a vase, as though to drop a hint of the sort of return present he would like to have.

'Probably the symbolic meaning of the parapraxis admits of a number of further variations - for example, his not wanting to fill the vase, etc. What strikes me, however, as more interesting is the consideration that the presence of several, at the least of two, motives (which probably operated separately out of the preconscious and the unconscious) is reflected in the doubling of the parapraxis - his knocking over the vase and then letting it fall from his hands.'

(e) Dropping, knocking over and breaking objects are acts which seem to be used very often to express unconscious trains of thought, as analysis can occasionally demonstrate, but as may more frequently be guessed from the superstitious or facetious interpretations popularly connected with them. The interpretations attached to salt being spilt, a wine-glass being knocked over, a dropped knife sticking in the ground, etc., are well known. I shall not discuss till later the question of what claims such superstitious interpretations have to being taken seriously. Here I need only remark that individual clumsy actions do not by any means always have the same meaning, but serve as a method of representing one purpose or another according to circumstances.

Recently we passed through a period in my house during which an unusually large amount of glass and china crockery was broken; I myself was responsible for some of the damage. But the little psychological epidemic could easily be explained: these were the days before my eldest daughter's wedding. On such festive occasions it used to be the custom deliberately to break some utensil and at the same time utter a phrase to bring good luck. This custom may have the significance of a sacrifice and it may have another symbolic meaning as well.

When servants drop fragile articles and so destroy them, our first thought is certainly not of a psychological explanation, yet it is not unlikely that here, too, obscure motives play their part. Nothing is more foreign to uneducated people than an appreciation of art and works of art. Our servants are dominated by a mute hostility towards the manifestations of art, especially when the objects (whose value they do not understand) become a source of work for them. On the other hand people of the same education and origin often show great dexterity and reliability in handling delicate objects in scientific institutions, once they have begun to identify themselves with their chief and to consider themselves an essential part of the staff.

I insert here a communication from a young technician which gives us some insight into the mechanism of a case of material damage:

'Some time ago I worked with several fellow-students in the laboratory of the technical college on a series of complicated experiments in elasticity, a piece of work which we had undertaken voluntarily but which was beginning to take up more time than we had expected. One day as I returned to the laboratory with my friend F., he remarked how annoying it was to him to lose so much time on that particular day as he had so much else to do at home. I could not help agreeing with him and added half jokingly, referring to an incident the week before: "Let us hope that the machine will go wrong again so that we can stop work and go home early." - In arranging the work it happened that F. was given the regulation of the valve of the press; that is to say, he was, by cautiously opening the valve, to let the fluid under pressure flow slowly out of the accumulator into the cylinder of the hydraulic press. The man conducting the experiment stood by the manometer and when the right pressure was reached called out a loud "stop!". At the word of command F. seized the valve and turned it with all his might - to the left! (All valves without exception are closed by being turned to the right.) This caused the full pressure of the accumulator to come suddenly on to the press, a strain for which the connecting-pipes are not designed, so that one of them immediately burst - quite a harmless accident to the machine, but enough to oblige us to suspend work for the day and go home. - It is characteristic, by the way, that when we were discussing the affair some time later my friend F. had no recollection whatever of my remark, which I recalled with certainty.'

Similarly, falling, stumbling and slipping need not always be interpreted as purely accidental miscarriages of motor actions. The double meanings that language attaches to these expressions are enough to indicate the kind of phantasies involved, which can be represented by such losses of bodily equilibrium. I can recall a number of fairly mild nervous illnesses in women and girls which set in after a fall not accompanied by any injury, and which were taken to be traumatic hysterias resulting from the shock of the fall. Even at that time I had an impression that these events were differently connected and that the fall was already a product of the neurosis and expressed the same unconscious phantasies with a sexual content, which could be assumed to be the forces operating behind the symptoms. Is not the same thing meant by a proverb which runs: 'When a girl falls she falls on her back'?

We can also count as bungled actions cases of giving a beggar a gold piece instead of a copper or small silver coin. The explanation of such mistakes is easy. They are sacrificial acts designed to appease fate, to avert harm, and so on. If a devoted mother or aunt, directly before going for a walk in the course of which she displays unwilling generosity of this kind, is heard to express concern over a child's health, we can have no more doubts about the meaning of the apparently disagreeable accident. In this way our parapraxes make it possible for us to practise all those pious and superstitious customs that must shun the light of consciousness owing to opposition from our reason, which has now grown sceptical.

(f) There is no sphere in which the view that accidental actions are really intentional will command a more ready belief than that of sexual activity, where the border line between the two possibilities seems really to be a faint one. A good example from my own experience of a few years ago shows how an apparently clumsy movement can be most cunningly used for sexual purposes. In the house of some friends I met a young girl who was staying there as a guest and who aroused a feeling of pleasure in me which I had long thought was extinct. As a result I was in a jovial, talkative and obliging mood. At the time I also endeavoured to discover how this came about; a year before, the same girl had made no impression on me. As the girl's uncle, a very old gentleman, entered the room, we both jumped to our feet to bring him a chair that was standing in the corner. She was nimbler than I was and, I think, nearer to the object; so she took hold of the chair first and carried it in front of her with its back towards her, gripping the sides of the seat with both hands. As I got there later, but still stuck to my intention of carrying the chair, I suddenly found myself standing directly behind her, and throwing my arms round her from behind; and for a moment my hands met in front of her waist. I naturally got out of the situation as rapidly as it had arisen. Nor does it seem to have struck anyone how dextrously I had taken advantage of this clumsy movement.

Occasionally, too, I have had to tell myself that the irritating and clumsy process of dodging someone in the street, when for several seconds one steps first to one side and then to the other, but always to the same side as the other person, till finally one comes to a standstill face to face with him (or her) - this 'getting in someone's way', I have had to tell myself, is once more a repetition of an improper and provocative piece of behaviour from earlier times and, behind a mask of clumsiness, pursues sexual aims. I know from my psycho-analyses of neurotics that what is described as the *naïveté* of young people and children is frequently only a mask of this sort, employed so that they may be able to say or do something improper without feeling embarrassed.

Wilhelm Stekel has reported very similar self-observations. 'I entered a house and offered my right hand to my hostess. In a most curious way I contrived in doing so to undo the bow that held her loose morning-gown together. I was conscious of no dishonourable intention; yet I carried out this clumsy movement with the dexterity of a conjurer.'

I have already been able again and again to produce evidence that creative writers think of parapraxes as having a meaning and a motive, just as I am arguing here. We shall not be surprised, therefore, to see from a fresh example how a writer invests a clumsy movement with significance, too, and makes it foreshadow later events.

Here is a passage from Theodor Fontane's novel *L'Adultera* 'Melanie jumped up and threw one of the large balls to her husband as though in greeting. But her aim was not straight, the ball flew to one side and Rubehn caught it.' On the return from the outing that led to this little episode a conversation between Melanie and Rubehn takes place which reveals the first signs of a budding affection. This affection blossoms into passion, so that Melanie finally leaves her husband and gives herself entirely to the man she loves. (Communicated by H. Sachs.)

(g) The effects produced by the parapraxes of normal people are as a rule of the most harmless kind. Precisely for this reason it is an especially interesting question whether mistakes of considerable importance which may be followed by serious consequences - for example, mistakes made by a doctor or a chemist -(are in any way open to the approach presented here.

As I very rarely find myself undertaking medical treatment, I can report only one example from my personal experience of a bungled action of a medical kind. There is a very old lady whom I have been visiting twice a day for some years. On my morning visit my medical services are limited to two actions. I put a few drops of eye-lotion into her eye and give her a morphine injection. Two bottles are always prepared for me: a blue one with the collyrium and a white one with the morphine solution. During the two operations my thoughts are no doubt usually busy with something else; by now I have performed them so often that my attention behaves as if it were at liberty. One morning I noticed that the automaton had worked wrong. I had put the dropper into the white bottle instead of the blue one and had put morphine into the eye instead of collyrium. I was greatly frightened and then reassured myself by reflecting that a few drops of a two per cent solution of morphine could not do any harm even in the conjunctival sac. The feeling of fright must obviously have come from another source.

In attempting to analyse this small mistake I first thought of the phrase 'sich an der Alten vergreifen',¹ which provided a short cut to the solution. I was under the influence of a dream which had been told me by a young man the previous evening and the content of which could only point to sexual intercourse with his own mother.² The strange fact that the legend finds nothing objectionable in Queen Jocasta's age seemed to me to fit in well with the conclusion that in being in love with one's own mother one is never concerned with her as she is in the present but with her youthful mnemonic image carried over from one's childhood. Such incongruities always appear when a phantasy that fluctuates between two periods is made conscious and so becomes definitely attached to one of the two periods. While absorbed in thoughts of this kind I came to my patient, who is over ninety, and I must have been on the way to grasping the universal human application of the Oedipus myth as correlated with the Fate which is revealed in the oracles; for at that point I did violence to or committed a blunder on 'the old woman'. Here again the bungled action was a harmless one; of the two possible errors, using the morphine solution for the eye or the eye lotion for the injection, I had chosen by far the more harmless one. This still leaves the question open of whether we may admit the possibility of an unconscious intention in mistakes that can cause serious harm, in the same way as in the cases which I have discussed.

Here then my material leaves me in the lurch, as might be expected, and I have to fall back on conjectures and inferences. It is well known that in the severer cases of psychoneurosis instances of self-injury are occasionally found as symptoms and that in such cases suicide can never be ruled out as a possible outcome of the psychical conflict. I have now learnt and can prove from convincing examples that many apparently accidental injuries that happen to such patients are really instances of self-injury. What happens is that an impulse to self-punishment, which is constantly on the watch and which normally finds expression in self-reproach or contributes to the formation of a symptom, takes ingenious advantage of an external situation that chance happens to offer, or lends assistance to that situation until the desired injurious effect is brought about. Such occurrences are by no means uncommon in cases even of moderate severity, and they betray the part which the unconscious intention plays by a number of special features - e. g. by the striking composure that the patients retain in what is supposed to be an accident.³

¹ ['To do violence to the old woman.' The German word '*vergreifen*' means both 'to make a blunder' and 'to commit an assault'.]

² The 'Oedipus dream', as I am in the habit of calling it, because it contains the key to the understanding of the legend of King Oedipus. In the text of Sophocles a reference to such a dream is put into Jocasta's mouth. Cf. *The Interpretation of Dreams* (1900a), p. 739 ff.

³ In the present state of our civilization self-injury which does not have total self-destruction as its aim has no other choice whatever than to hide itself behind something accidental or to manifest itself by imitating the onset of a spontaneous illness. Formerly self-injury was a customary sign of mourning; at other periods it could express trends towards piety and renunciation of the world.

Instead of a number of cases I will give a detailed report of only a single example from my medical experience. A young married woman broke her leg below the knee in a carriage accident, so that she was bed-ridden for weeks; what was striking was the absence of any expressions of pain and the calmness with which she bore her misfortune. This accident introduced a long and severe neurotic illness of which she was finally cured by psycho-analysis. In treating her I learnt of the circumstances surrounding the accident and of certain events that had preceded it. The young woman was staying with her very jealous husband on the estate of a married sister, in company with her numerous other sisters and brothers with their husbands and wives. One evening in this intimate circle she showed off one of her accomplishments: she gave an accurate performance of the can-can, which was received with hearty applause by her relatives but with scanty satisfaction by her husband, who afterwards whispered to her: 'Carrying on like a tart again!' The remark struck home - we will not enquire whether it was only on account of the dancing display. She spent a restless night. Next morning she felt a desire to go for a drive. She selected the horses herself, refusing one pair and asking for another. Her youngest sister wanted her baby and its nurse to go in the carriage with her; my patient vigorously opposed this. During the drive she showed signs of nerves; she warned the coachman that the horses were growing skittish, and when the restless animals were really causing a moment's difficulty she jumped out in a fright and broke her leg, while the others who stayed in the carriage were unharmed. Although after learning these details we can hardly remain in doubt that this accident was really contrived, we cannot fail to admire the skill which forced chance to mete out a punishment that fitted the crime so well. For it had now been made impossible for her to dance the can-can for quite a long time.

As regards self-injuries of my own, there is little that I can report in uneventful times; but in extraordinary circumstances I find that I am not incapable of them. When a member of my family complains to me of having bitten his tongue, pinched a finger, or the like, he does not get the sympathy he hopes for, but instead the question: 'Why did you do that?' I myself once gave my thumb a most painful pinch when a youthful patient told me during the hour of treatment of his intention (not of course to be taken seriously) of marrying my eldest daughter. I knew that at the time she was lying critically ill in a sanatorium.

One of my boys, whose lively temperament used to make it difficult to nurse him when he was ill, had a fit of anger one day because he was ordered to spend the morning in bed, and threatened to kill himself, a possibility that was familiar to him from the newspapers. In the evening he showed me a swelling on one side of his chest which he had got by bumping against a door-handle. To my ironical question as to why he had done it and what he meant by it, the eleven-year-old child answered as though it had suddenly dawned on him: 'That was my attempt at suicide that I threatened this morning.' I do not think, by the way, that my views on self-injury were accessible to my children at the time.

Anyone who believes in the occurrence of half-intentional self-*injury* - if I may use a clumsy expression - will be prepared also to assume that in addition to consciously intentional suicide there is such a thing as half-intentional self-*destruction* (self-destruction with an unconscious intention), capable of making skilful use of a threat to life and of disguising it as a chance mishap. There is no need to think such self-destruction rare. For the trend to self-destruction is present to a certain degree in very many more human beings than those in whom it is carried out; self-injuries are as a rule a compromise between this instinct and the forces that are still working against it, and even where suicide actually results, the inclination to suicide will have been present for a long time before in lesser strength or in the form of an unconscious and suppressed trend.

Even a *conscious* intention of committing suicide chooses its time, means and opportunity; and it is quite in keeping with this that an *unconscious* intention should wait for a precipitating occasion which can take over a part of the causation and, by engaging the subject's defensive forces, can liberate the intention from their pressure.¹ The views I am putting forward here are far from being idle ones. I have learned of more than one apparently chance mishap (on horseback or in a carriage) the details of which justify a suspicion that suicide was unconsciously allowed to come about. For example, an officer, riding in a race with some fellow-officers, fell from his horse and was so severely injured that he died some days later. His behaviour on regaining consciousness was striking in some ways; and his previous behaviour had been even more remarkable. He had been deeply depressed by the death of his beloved mother, had had fits of sobbing in the company of his fellow officers, and to his trusted friends had spoken of being weary of life. He had wanted to leave the service to take part in a war in Africa which had not interested him previously;² formerly a dashing rider, he now avoided riding whenever possible. Finally, before the race, from which he could not withdraw, he expressed gloomy forebodings; with the view that we hold in these matters, it will not remain a surprise to us that these forebodings turned out to be justified. I shall be told that it is not to be wondered at if a person in such a state of nervous depression cannot manage a horse as well as on normal days. I quite agree; but the mechanism of the motor inhibition produced by this state of 'nerves' should, I think, be looked for in the intention of self-destruction that I am insisting on.

¹ After all, the case is no different from that of a sexual assault upon a woman, where the man's attack cannot be repelled by her full muscular strength because a portion of her unconscious impulses meets the attack with encouragement. It is said, as we know, that a situation of this kind *paralyses* a woman's strength; all we need do is to add the reasons for this paralysis. To that extent the ingenious judgement delivered by Sancho Panza as governor of his island is psychologically unjust (*Don Quixote*, Part 2, Chapter 45). A woman dragged a man before the judge alleging he had robbed her of her honour by violence. In compensation Sancho gave her a full purse of money which he took from the accused; but after the woman's departure he gave him permission to pursue her and snatch his purse back again from her. The two returned struggling, the woman priding herself on the fact that the villain had not been able to take the purse from her. Thereupon Sancho declared: 'If you had defended your honour with half the determination with which you have defended this purse, the man could not have robbed you of it.'

² It is evident that conditions on a field of battle are such as to come to the help of a conscious intention to commit suicide which nevertheless shuns the direct way. Compare the words of the Swedish captain concerning the death of Max Piccolomini in *Wallensteins Tod*: 'They say he wanted to die.'

S. Ferenczi of Budapest has handed over to me for publication the analysis of an ostensibly accidental injury by shooting, which he explains as an unconscious attempt at suicide. I can only declare my agreement with his view of the matter:

'J. Ad., twenty-two years old, a journeyman carpenter, consulted me on January 18, 1908. He wanted to find out from me whether the bullet that penetrated his left temple on March 20, 1907 could or should be removed by operation. Apart from occasional, not too severe, headaches he felt perfectly well, and the objective examination revealed nothing at all apart from the characteristic powder-blackened bullet scar on the left temple, so I advised against an operation. When asked about the circumstances of the case he explained that he had injured himself accidentally. He was playing with his brother's revolver, *thought it was not loaded*, pressed it with his left hand against his *left* temple (he is not left-handed,) put his finger on the trigger and the shot went off. *There were three bullets in the six-shooter*. I asked him how the idea of taking up the revolver came to him. He replied that it was the time of his medical examination for military service; the evening before, he took the weapon with him to the inn because he was afraid of brawls. At the examination he was found unfit because of varicose veins; he was very ashamed of this. He went home and played with the revolver, but had no intention of hurting him self - and then the accident happened. When questioned further whether he was otherwise satisfied with life, he sighed in answer and told the story of his love for a girl who also loved him but left him all the same. She emigrated to America simply out of desire for money. He wanted to follow her, but his parents prevented him. His sweetheart left on January 20, 1907; two months, that is, before the accident. In spite of all these suspicious factors the patient stuck to his point that the shooting was an "accident". I was however firmly convinced that his negligence in failing to make sure the weapon was not loaded before playing with it, as well as his self-inflicted injury, were psychically determined. He was still labouring under the depressing effects of his unhappy love affair and obviously wanted to "forget it all" in the army. When he was deprived of this hope as well, he took to playing with the revolver - i. e. to an unconscious attempt at suicide. His holding the revolver in his left and not his right hand is strong evidence that he was really only "playing" - that is, that he did not consciously wish to commit suicide.'

Another analysis of an apparently accidental self-inflicted injury, which its observer (Van Emden, 1911) has passed on to me, recalls the proverb: 'He who digs a pit for others falls in it himself.'

'Frau X., who comes of a good middle-class family, is married with three children. She suffers from her nerves, it is true, but has never needed any energetic treatment as she is sufficiently able to cope with life. One day she incurred a facial disfigurement which was somewhat striking at the time though it was only temporary. It happened as follows. She stumbled on a heap of stones in a street under repair and struck her face against the wall of a house. The whole of her face was scratched; her eyelids became blue and oedematous and as she was afraid that something might happen to her eyes she had the doctor called in. After she had been reassured on that score, I asked her: 'But why did you in fact fall in that way?' She replied that, directly before this, she had warned her husband, who had been suffering for some months from a joint affection and therefore had difficulty in walking, to take great care in that street, and it had been a fairly frequent experience of hers to find in cases of the kind that in some remarkable way the very thing happened to her that she had warned someone else against.

'I was not satisfied that this was what had determined her accident and asked if perhaps she had something more to tell me. Yes, just before the accident she had seen an attractive picture in a shop on the other side of the street; she had quite suddenly desired it as an ornament for the nursery and therefore wanted to buy it immediately. She walked straight towards the shop, without looking at the ground, stumbled over the heap of stones and in falling struck her face against the wall of the house without making even the slightest attempt to shield herself with her hands. The intention of buying the picture was immediately forgotten and she returned home as fast as possible. - "But why didn't you keep a better look-out?" I asked. "Well," she answered, "perhaps it was a *punishment* - on account of that episode I told you about in confidence." - "Has it gone on worrying you so much then?" - "Yes - I regretted it very much afterwards; I considered myself wicked, criminal and immoral, but at the time I was almost crazy with my nerves."

'The reference was to an abortion which she had had carried out with her husband's consent, as, owing to their financial circumstances, the couple did not wish to be blessed with any further children. This abortion had been started by a woman quack but had had to be completed by a specialist.

"I often reproach myself by thinking 'You really had your child killed' and I was afraid such a thing couldn't go unpunished. Now that you've assured me there's nothing wrong with my eyes, my mind's quite at rest: I've been *sufficiently punished* now in any case."

'This accident was therefore a self-punishment, firstly to atone for her crime, but secondly also to escape from an unknown punishment of perhaps much greater severity of which she had been in continual dread for months. In the moment that she dashed towards the shop to buy the picture, the memory of the whole episode with all its fears, which had already been fairly strongly active in her unconscious when she had warned her husband, became overwhelming and might perhaps have been expressed in some words like these: "Why do *you* need an ornament for the nursery? - you had your child destroyed! You're a murderess. The great punishment's just coming down on you for certain!"

'This thought did not become conscious; but instead of it she used the situation, at what I might call this psychological moment, for punishing herself unobtrusively with the help of the heap of stones which seemed suitable for the purpose. This is the reason why she did not even put out her hands as she fell and also why she was not seriously frightened. The second and probably less important determinant of her accident was no doubt self-punishment for her *unconscious* wish to be rid of her husband, who, incidentally, had been an accomplice in the crime. This wish was betrayed by her entirely superfluous warning to him to keep an eye open for the heap of stones in the street, since her husband walked with great care precisely because he was bad on his legs.'¹

¹ [Footnote added 1920:] A correspondent writes to me as follows on the subject of 'self-punishment by means of parapraxes': 'If one studies the way people behave in the street one has a chance of seeing how often men who turn round to look back at passing women - not an unusual habit - meet with a minor accident. Sometimes they will sprain an ankle - on a level pavement; sometimes they will bump into a lamp post or hurt themselves in some other way.'

When the details of the case are considered one will also be likely to feel that Stärcke (1916) is right in regarding an apparently accidental self-injury by burning as a 'sacrificial act':

'A lady whose son-in-law had to leave for Germany for military service scalded her foot in the following circumstances. Her daughter was expecting her confinement soon and reflections on the perils of war naturally did not put the family into a very cheerful mood. The day before his departure she had asked her son-in-law and daughter in for a meal. She herself prepared the meal in the kitchen after having first - strangely enough - changed her high, laced boots with arch-supports, which were comfortable for walking and which she usually wore indoors as well, for a pair of her husband's slippers that were too large and were open at the top. While taking a large pan of boiling soup off the fire she dropped it and in this way scalded one foot fairly badly - especially the instep, which was not protected by the open slipper. - Everyone naturally put this accident down to her understandable "nerves". For the first few days after this burnt offering she was particularly careful with anything hot, but this did not prevent her some days later from scalding her wrist with hot gravy.'¹

¹ [Footnote added 1924:] In a very large number of cases like these of injury or death in accidents the explanation remains a matter of doubt. The outsider will find no occasion to see in the accident anything other than a chance occurrence, while someone who is closely connected with the victim and is familiar with intimate details has reason to suspect the unconscious intention behind the chance occurrence. The following account by a young man whose fiancée was run over in the street gives a good example of the kind of intimate knowledge that I mean and of the type of accessory details in question:

'Last September I made the acquaintance of a Fräulein Z., aged 34. She was in well-to-do circumstances, and had been engaged before the war, but her fiancé had fallen in action in 1916 while serving as an officer. We came to know and become fond of each other, not at first with any thought of marrying, as the circumstances on both sides, in particular the difference in our ages (I myself was 27), seemed to rule that out. As we lived opposite each other in the same street and met every day, our relationship took an intimate turn in course of time. Thus the idea of marriage came more into view and I finally agreed to it myself. The betrothal was planned for this Easter; Fräulein Z., however, intended first to make a journey to her relatives at M., but this was suddenly prevented by a railway strike that had been called as a result of the Kapp Putsch. The gloomy prospects that the workers' victory and its consequences appeared to hold out for the future had their effect for a brief time on our mood, too, but especially on Fräulein Z., always a person of very changeable moods, since she thought she saw new obstacles in the way of our future. On Saturday, March 20, however, she was in an exceptionally cheerful frame of mind - a state of affairs that took me quite by surprise and carried me along with her, so that we seemed to see everything in the rosiest colours. A few days before, we had talked of going to church together some time, without however having fixed a definite date. At 9. 15 the next morning, Sunday, March 21, she telephoned to ask me to fetch her to church straight away; but I refused, as I could not have got ready in time, and had, besides, work I wanted to finish. Fräulein Z. was noticeably disappointed; she then set out alone, met an acquaintance on the stairs at her house and walked with him for the short distance along the Tauentzienstrasse to the Rankestrasse, in the best of humour and without referring at all to our conversation. The gentleman bade her good-bye with a joking remark. Fräulein Z. had only to cross the Kurfürstendamm where it widened out and one could have a clear view along it; but, close to the pavement, she was run over by a horse-drawn cab. (Contusion of the liver, which led to her death a few hours later.) - We had crossed at that point hundreds of times before; Fräulein Z. was exceedingly careful, and very often prevented me from being rash; on this morning there was almost no traffic whatever, the trams, omnibuses, etc. were on strike. Just about that time there was almost *absolute quiet*, even if she did not see the cab she must at all events have heard it! Everybody supposed it was an "accident". My first thought was: "That's impossible - but on the other hand there can be no question of its having been intentional." I tried to find a psychological explanation. After some considerable time I thought I had found it in your *Psychopathology of Everyday Life*. In particular, Fräulein Z. showed at various times a certain leaning in the direction of suicide and even tried to induce me to think the same way - thoughts from which I have often enough dissuaded her; for example, only two days before, after returning from a walk, she began, without any external reason at all, to talk about her death and the provisions for dealing with her estate. (She had not, by the way, done anything about this! - an indication that these remarks definitely did not have any intention behind them.) If I may venture on an opinion, I should regard this calamity not as an accident, nor as an effect of a clouding of consciousness, but as an intentional self-destruction performed with an unconscious purpose, and disguised as a chance mishap. This view of mine is confirmed by remarks which Fräulein Z. made to her relatives, both earlier, before she knew me, and also more recently, as well as by remarks to me up to within the last few days; so that I am tempted to regard the whole thing as an effect of the loss of her former fiancé, whom in her eyes nothing could replace.'

If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. *Almost*, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

Stärcke (1916) has given an example of the way in which creative writers do not hesitate to put a bungled action in the place of an intentional action and to make it in this way the source of the gravest consequences:

'In one of Heijermans' (1914) sketches there occurs an example of a bungled action, or, more precisely, of a faulty action which the author uses as a dramatic *motif*.

'The sketch is called "Tom and Teddie". They are a pair of divers who appear in a variety theatre; their act is given in an iron tank with glass walls, in which they stay under water for a considerable time and perform tricks. Recently the wife has started an affair with another man, an animal-trainer. Her diver-husband has caught them together in the dressing-room just before the performance. Dead silence, menacing looks, with the diver saying: "Afterwards!" - The act begins. The diver is about to perform his hardest trick: he will remain "two and a half minutes under water in a hermetically sealed trunk". - This is a trick they had performed often enough; the trunk was locked and "Teddie used to show the key to the audience, who checked the time by their watches". She also used purposely to drop the key once or twice into the tank and then dive hurriedly after it, so as not to be too late when the time came for the trunk to be opened.

"This particular evening, January 31st, saw Tom locked up as usual by the neat fingers of his brisk and nimble wife. He smiled behind the peep-hole - she played with the key and waited for his warning sign. The trainer stood in the wings, in his impeccable evening dress, with his white tie and his horse-whip. Here was the 'other man'. To catch her attention he gave a very short whistle. She looked at him, laughed, and with the clumsy gesture of someone whose attention is distracted she threw the key so wildly in the air that at exactly two minutes and twenty seconds, by an accurate reckoning, it fell by the side of the tank in the middle of the bunting covering the pedestal. No one had seen it. No one could see it. Viewed from the house the optical illusion was such that everyone saw the key fall into the water - and none of the stage hands heard it since the bunting muffled the sound.

"Laughing, Teddie clambered without delay, over the edge of the tank. Laughing - Tom was holding out well - she came down the ladder. Laughing, she disappeared under the pedestal to look there and, when she did not find the key at once, she bowed in front of the bunting with a priceless gesture, and an expression on her face as if to say 'Gracious me! what a nuisance this is!'.
"

"Meanwhile Tom was grimacing in his droll way behind the peep-hole, as if he too was becoming agitated. The audience saw the white of his false teeth, the champing of his lips under the flaxen moustache, the comical bubble-blowing that they had seen earlier, when he was eating the apple. They saw his pale knuckles as he grappled and clawed, and they laughed as they had laughed so often already that evening.
"

"Two minutes and fifty-eight seconds . . .

"Three minutes and seven seconds . . . twelve seconds . . .

"Bravo! Bravo! Bravo!

"Then consternation broke out in the house and there was a shuffling of feet, when the stage hands and the trainer began to search too and the curtain came down before the lid had been raised.
"

"Six English dancing-girls came on - then the man with the ponies, dogs and monkeys. And so on.
"

"It was not till the next morning that the public knew there had been an accident, that Teddie had been left a widow. . . ."

'It is clear from this quotation what an excellent understanding the author must himself have had of the nature of a symptomatic act, seeing that he demonstrates to us so strikingly the deeper cause of the fatal clumsiness.'

CHAPTER IX

SYMPTOMATIC AND CHANCE ACTIONS

The actions described so far, in which we recognized the carrying out of an unconscious intention, made their appearance in the form of disturbances of other intended actions and concealed themselves behind the pretext of clumsiness. The 'chance' actions which are now to be discussed differ from 'bungled' actions merely in the fact that they scorn the support of a conscious intention and are therefore in no need of a pretext. They appear on their own account, and are permitted because they are not suspected of having any aim or intention. We perform them 'without thinking there is anything in them', 'quite accidentally', 'just to have something to do'; and such information, it is expected, will put an end to any enquiry into the significance of the action. In order to be able to enjoy this privileged position, these actions, which no longer put forward the excuse of clumsiness, have to fulfil certain conditions: they must be *unobtrusive* and their effects must be slight.

I have collected a large number of such chance actions from myself and from others, and after closely examining the different examples I have come to the conclusion that the name of *symptomatic acts* is a better one for them. They give expression to something which the agent himself does not suspect in them, and which he does not as a rule intend to impart to other people but to keep to himself. Thus, exactly like all the other phenomena which we have so far considered, they play the part of symptoms.

The richest supply of such chance or symptomatic acts is in fact to be obtained during the psycho-analytic treatment of neurotics. I cannot resist quoting two examples from this source which show how extensively and in what detail these insignificant occurrences are determined by unconscious thoughts. The borderline between symptomatic acts and bungled actions is so ill-defined that I might equally well have included these examples in the last chapter.

(1) During a session a young married woman mentioned by way of association that she had been cutting her nails the day before and 'had cut into the flesh while she was trying to remove the soft cuticle at the bottom of the nail'. This is of so little interest that we ask ourselves in surprise why it was recalled and mentioned at all, and we begin to suspect that what we are dealing with is a symptomatic act. And in fact it turned out that the finger which was the victim of her small act of clumsiness was the ring-finger, the one on which a wedding ring is worn. What is more, it was her wedding anniversary; and in the light of this the injury to the soft cuticle takes on a very definite meaning, which can easily be guessed. At the same time, too, she related a dream which alluded to her husband's clumsiness and her anaesthesia as a wife. But why was it the ring-finger on her *left* hand which she injured, whereas a wedding ring is worn on the *right* hand? Her husband is a lawyer, a 'doctor of law', and as a girl her affections belonged in secret to a physician (jokingly called '*Doktor der Linke*'). A 'left-handed marriage', too, has a definite meaning.

(2) A young unmarried lady said to me: 'Yesterday I quite unintentionally tore a hundred florin note in two and gave half to a lady who was visiting me. Am I to take this as a symptomatic act as well?' Closer investigation disclosed the following particulars. The hundred florin note: - She devoted part of her time and means to charitable work. Together with another lady she was providing for the bringing up of an orphan. The hundred florins were the contribution sent to her by the other lady. She had put them in an envelope and placed it on her writing table for the time being.

The visitor was a lady of good standing whom she was assisting in another charitable cause. This lady wished to make a note of the names of a number of people whose support could be enlisted. There was no paper at hand, so my patient reached for the envelope on her desk, and without thinking of what it contained tore it in two; one piece she kept herself, so as to have a duplicate set of names, and the other she handed to her visitor. It should be observed that her act, though certainly inappropriate, was perfectly harmless. If a hundred florin note is torn up, it does not, as is well known, lose any of its value so long as it can be put together again completely from the fragments. The importance of the names on the piece of paper was a guarantee that the lady would not throw it away, and it was equally certain that she would restore the valuable contents as soon as she noticed them.

But what was the unconscious thought to which this chance action, made possible by forgetfulness, was meant to give expression? The visitor stood in a very definite relation to my patient's treatment. It was this lady who had formerly recommended me to her as a doctor, and, if I am not mistaken, my patient felt herself under an obligation to her for this advice. Was the half of the hundred florin note perhaps meant to represent a fee for her services as an intermediary? That would still be very strange.

Further material was however forthcoming. A little time before, a woman who was an intermediary of a very different kind had enquired of a relative of the patient's whether the young lady would perhaps like to make a certain gentleman's acquaintance; and that morning, a few hours before the lady's visit, the suitor's letter of proposal had arrived and had caused much amusement. So when the lady opened the conversation by enquiring after my patient's health, the latter might well have thought: 'You certainly found me the right doctor, but if you could help me to get the right husband' (with the further thought: 'and to get a child') 'I should be *more* grateful.' This thought, which was kept repressed, formed the starting-point from which the two intermediaries became fused into one, and she handed her visitor the fee which her phantasy was ready to give the other woman. This solution becomes entirely convincing when I add that I had been telling the patient about such chance or symptomatic acts only the evening before. She thereupon took the first opportunity of producing something analogous.

These extremely frequent chance and symptomatic acts might be arranged in three groups, according to whether they occur habitually, regularly under certain conditions, or sporadically. Actions of the first group (such as playing with one's watch-chain, fingering one's beard and so on), which can almost be taken as characteristics of the person concerned, trench upon the multifarious movements known as *tics* and no doubt deserve to be dealt with in connection with them. In the second group I include playing with a stick or scribbling with a pencil that one happens to be holding, jingling coins in one's pocket, kneading bread-crumbs and other plastic materials, fiddling with one's clothing in all kinds of ways and so forth. During psychical treatment idle play of this sort regularly conceals a sense and meaning which are denied any other form of expression. Generally the person concerned is quite unaware that he is doing anything of the kind or that he has modified his usual play in certain ways; and he fails to see and hear the effects of these actions. He does not, for example, hear the noise made by the jingling of coins, and, if his attention is drawn to it, he behaves as though he were astonished and incredulous. All the things that a person does with his clothing, often without realizing it, are no less important and deserve the doctor's attention. Every change in the clothing usually worn, every small sign of carelessness - such as an unfastened button - every trace of exposure, is intended to express something which the wearer of the clothes does not want to say straight out and which for the most part he is unaware of. The interpretations of these small chance actions, and the evidence for these interpretations, emerge each time with sufficient certainty from the material which accompanies them during the session, from the topic that is under discussion and from the associations that occur when attention is drawn to the apparently chance action. Because of this I shall not proceed to support my assertions with examples accompanied by analyses; but I mention these actions because I believe that they have the same meaning in the case of normal people as they have in my patients.

I cannot refrain from showing by at least one example how close the connection can be between a symbolic action performed through force of habit and the most intimate and important aspects of a healthy person's life:¹

'As Professor Freud has taught us, symbolism plays a greater role in the childhood of normal people than earlier psycho-analytical experiences had led one to expect. In this connection the following short analysis may be of some interest, especially in view of its medical subject-matter.

'A doctor on rearranging his furniture in a new house came across an old-fashioned, straight wooden stethoscope, and, after pausing to decide where he should put it, was impelled to place it on the side of his writing-desk in such a position that it stood exactly between his chair and the one reserved for his patients. The act in itself was somewhat odd, for two reasons. In the first place he does not use a stethoscope at all often (he is in fact a neurologist) and if he needs one he uses a binaural one. In the second place all his medical apparatus and instruments were kept in drawers, with the sole exception of this one. However, he gave no further thought to the matter until one day a patient, who had never seen a straight stethoscope, asked him what it was. On being told, she asked why he kept it just there; he answered in an off-hand way that that place was as good as any other. This started him thinking, however, and he wondered whether there had been any unconscious motive in his action, and being familiar with the psycho-analytical method he decided to investigate the matter.

'The first memory that occurred to him was the fact that when a medical student he had been struck by the habit his hospital interne had of always carrying in his hand a straight stethoscope on his ward visits, although he never used it. He greatly admired this interne, and was much attached to him. Later on, when he himself became an interne, he contracted the same habit, and would feel very uncomfortable if by mistake he left his room without having the instrument to swing in his hand. The aimlessness of the habit was however shown, not only by the fact that the only stethoscope he ever used was a binaural one, which he carried in his pocket, but also in that it was continued when he was a surgical interne and never needed any stethoscope at all. The significance of these observations immediately becomes clear if we refer to the phallic nature of this symbolic action.

¹ Ernest Jones (1910a).

'He next recalled the fact that in his early childhood he had been struck by the family doctor's habit of carrying a straight stethoscope inside his hat; he found it interesting that the doctor should always have his chief instrument handy when he went to see patients and only had to take off his hat (i. e. a part of his clothing) and "pull it out". As a small child he had been strongly attached to this doctor; and a brief self-analysis enabled him to discover that at the age of three and a half he had had a double phantasy concerning the birth of a younger sister - namely that she was the child, firstly, of himself and his mother, and secondly, of the doctor and himself. Thus in this phantasy he played both a masculine and a feminine part. He further recalled having been examined by the same doctor when he was six, and distinctly recollected the voluptuous sensation of feeling the doctor's head near him pressing the stethoscope into his chest, and the rhythmic to-and-fro respiratory movement. At the age of three he had had a chronic chest affection which necessitated repeated examination, although he could not in fact still remember it.

'At the age of eight he was impressed by being told by an older boy that it was the doctor's custom to get into bed with his women patients. There certainly was some real basis for this rumour; at all events the women of the neighbourhood, including the subject's own mother, were very attached to the young and handsome doctor. The subject had himself on several occasions experienced sexual temptations in regard to his women patients; he had twice fallen in love with one and finally had married one. It can hardly be doubted that his unconscious identification with the doctor was the chief motive for his adoption of the medical profession. Other analyses lead us to suppose that this is undoubtedly the commonest motive (though it is hard to determine just how common). In the present case it was doubly determined: firstly by the superiority of the doctor on several occasions over the father, of whom the son was very jealous, and secondly by the doctor's knowledge of forbidden topics and his opportunities for sexual satisfaction.

'Then came a dream which I have already published elsewhere (Jones 1910*b*); it was plainly of a homosexual-masochistic nature. In this dream a man who was a substitutive figure for the doctor attacked the subject with a "sword". The sword reminded him of a passage in the Völsung Nibelungen Saga, where Sigurd places a naked sword between himself and the sleeping Brünhilde. The same episode occurs in the Arthurian legend which our subject also knows well.

'The meaning of the symptomatic act now becomes clear. Our doctor placed his straight stethoscope between himself and his women patients exactly as Sigurd placed his sword between himself and the woman he was not to touch. The act was a compromise-formation: it satisfied two impulses. It served to satisfy in his imagination the suppressed wish to enter into sexual relations with any attractive woman patient, but at the same time it served to remind him that this wish could not become a reality. It was, so to speak, a charm against yielding to temptation.

'I might add that the following lines from Lord Lytton's *Richeleau* made a great impression on the boy:

Beneath the rule of men entirely great
The pen is mightier than the sword. . . .¹

and that he has become a prolific writer and uses an exceptionally large fountain pen. When I asked him why he needed it he gave the characteristic response: "I have so much to express."

'This analysis again reminds us what profound insight is afforded into mental life by "innocent" and "meaningless" acts, and how early in life the tendency to symbolization develops.'

¹ Compare Oldham's: 'I wear my pen as others do their sword.'

I can quote a further instance from my psychotherapeutic experience in which eloquent testimony was borne by a hand playing with a lump of bread-crumbs. My patient was a boy of not yet thirteen; for almost two years he had been severely hysterical and I finally took him for psycho-analytic treatment after a lengthy stay in a hydropathic institution had brought no success. I was going on the assumption that he must have had sexual experiences and be tormented by sexual questions, which was likely enough at his age; but I refrained from helping him with explanations as I wished to put my hypotheses once again to the test. I was therefore naturally curious as to the way in which he would bring out what I was looking for. One day it struck me that he was rolling something between the fingers of his right hand; he would thrust it in his pocket and continue playing with it there, and then take it out again, and so on. I did not ask what he had in his hand; but he suddenly opened his hand and showed me. It was bread-crumbs kneaded into a lump. At the next session he again brought along a similar lump and this time, while we were talking, he modelled figures out of it which excited my interest; he did this with incredible rapidity, with his eyes closed. They were undoubtedly little men, with a head, two arms and two legs, like the crudest prehistoric idols, and with an appendage between the legs which he drew out into a long point. He had hardly completed this when he kneaded the figure together again; later he allowed it to remain, but drew out a similar appendage from the surface of the back and other parts of the body in order to disguise the meaning of the first one. I wanted to show him I had understood him, but at the same time I wanted to prevent him from pretending that he had not thought of anything while he was engaged in making these figures. With this in mind I suddenly asked him if he remembered the story of the Roman king who gave his son's envoy an answer in dumb-show in his garden. The boy failed to recall it, although he must have learnt it so much more recently than I. He asked whether it was the story of the slave and the answer that was written on his shaven head. No, I answered, that is from Greek history, and I told him the story. King Tarquinius Superbus had made his son Sextus find his way secretly into a hostile Latin city. The son, who had meanwhile collected a following in the city, sent a messenger to the king asking what steps he should take next. The king did not answer, but went into his garden, had the question repeated to him there, and then silently struck off the heads of the tallest and finest poppies. All that the messenger could do was to report this to Sextus, who understood his father and arranged for the most distinguished citizens in the city to be removed by assassination.

While I was speaking, the boy stopped kneading and, as I was on the point of describing what the king did in his garden and had reached the words 'silently struck', he made a lightning movement and tore the head off his little man. He had therefore understood me and had seen that he had been understood by me. I could now question him directly, I gave him the information he needed, and in a short time we had brought the neurosis to an end.

The symptomatic acts that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything - and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers - made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by pointing to the egg-shell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so very much easier, and without more ado took as the basis of our discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could be reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.

Dr. J. E. G. van Emden (The Hague) reports another case of 'confession through a parapraxis'. 'In making out my bill, the waiter in a small restaurant in Berlin announced that the price of a particular dish had been increased by ten pfennigs, owing to the war. When I asked why this was not shown on the menu he replied that that must just be an oversight - the price had certainly gone up. He pocketed the money clumsily and dropped a ten pfennig coin on the table right in front of me.

"Now I know for certain that you've charged me too much. Would you like me to enquire at the cash desk?"

"Excuse me . . . one moment, please," and he had gone.

'Needless to say, I allowed him his retreat, and, after he had apologized a couple of minutes later for having for some unknown reason confused my dish with another one, I let him keep the ten pfennigs as a reward for his contribution to the psychopathology of everyday life.'

Anyone who cares to observe his fellow men while they are at table will be able to observe the neatest and most instructive symptomatic acts.

Thus Dr. Hanns Sachs relates: 'I happened to be present when an elderly couple, relatives of mine, took their evening meal. The lady suffered from a gastric complaint and had to observe a very strict diet. A piece of roast meat had just been set before the husband, and he asked his wife, who was not allowed to join in this course, to pass him the mustard. His wife opened the cupboard, reached inside, and put her little bottle of stomach drops on the table in front of her husband. There was of course no resemblance between the barrel-shaped mustard pot and the little bottle of drops which might have accounted for her picking up the wrong one; yet the wife did not notice her confusion of the two until her husband laughingly called her attention to it. The meaning of the symptomatic act needs no explanation.'

I owe to Dr. B. Dattner, of Vienna, an excellent example of this kind which the observer made very skilful use of:

'I was lunching in a restaurant with my colleague H., a doctor of philosophy. He spoke of the hardships of probationary students, and mentioned incidentally that before he had finished his studies he was given the post of secretary to the ambassador, or, more precisely, the minister plenipotentiary and extraordinary, of Chile. "But then the minister was transferred and I did not present myself to his successor." While he was uttering the last sentence he raised a piece of cake to his mouth, but let it drop from the knife in apparent clumsiness. I immediately grasped the hidden meaning of this symptomatic act, and, as it were casually, interjected to my colleague, who was unfamiliar with psycho-analysis: "You certainly allowed a tasty morsel to slip from you there." He did not, however, notice that my words could apply equally well to his symptomatic act, and repeated my exact words with a peculiarly charming and surprising liveliness just as if my remark had taken the words out of his mouth: "Yes, that was certainly a tasty morsel that I allowed to slip from me", and went on to unburden himself by means of a detailed description of the clumsiness which had lost him this well-paid position.

'The meaning of the symbolic symptomatic act becomes clearer if it is realized that my colleague had scruples about telling a fairly remote acquaintance like myself of his precarious material situation, and that the obtrusive thought thereupon disguised itself as a symptomatic act which expressed symbolically what was meant to be hidden and in this way afforded the speaker relief which arose from unconscious sources.'

The following examples will show how much meaning may turn out to lie in an apparently unintentional act of carrying something off or taking something away with one.

Dr. B. Dattner relates: 'A colleague paid a visit to a friend, a lady he had much admired in the days of his youth; it was the first visit after her marriage. He told me of this visit and expressed his surprise at the fact that he had not succeeded in keeping his resolution to stay only a very short time with her. He then went on to recount a singular parapraxis which had happened to him there. His friend's husband, who had joined in the conversation, had looked for a box of matches which had quite definitely been on the top of the table when he arrived. My colleague, too, had looked through his pockets to see whether he had not accidentally "snapped it up",¹ but without avail. Some time later he had in fact found "it" in his pocket, and was struck by the fact that there was only a single match in the box. - A dream a few days later which prominently displayed the match-box symbolism and was concerned with this same friend of his youth confirmed my explanation that my colleague's symptomatic act was intended to announce that he had prior rights and to demonstrate his claim to exclusive possession (only one match in the box).'

Dr. Hanns Sachs relates: 'Our maid is particularly fond of a certain kind of cake. There is no possible doubt of this, as it is the only thing that she always makes well. One Sunday she brought in this particular cake, put it down on the sideboard, removed the plates and cutlery of the previous course and stacked them on the tray on which she had brought in the cake; she then put the cake back on the top of this pile instead of on the table, and disappeared with it into the kitchen. Our first idea was that she had noticed something that ought to be put right about the cake, but when she failed to appear again my wife rang and asked: "Betty, what has happened to the cake?" "How do you mean?" replied the maid, not understanding. We had first to point out to her that she had taken the cake away with her again. She had put it on the pile of dishes, carried it out and put it away "without noticing". - Next day, as we were about to eat what remained of this cake, my wife noticed that there was just as much as we had left the day before - in other words, that the maid had rejected her own share of her favourite dish. When asked why she had not eaten any of the cake she replied in some embarrassment that she had not wanted any. - The infantile attitude is very clear on both occasions: first the childish insatiability which did not want to share the object of her wishes with anyone, followed by the equally childish defiant reaction: "If you grudge it me, keep it for yourselves; I don't want anything at all now."

¹ [In German the word for 'box' (*Schätel*) is feminine; so that this might equally mean 'snapped *her* up'.]

Chance actions and symptomatic acts occurring in matrimonial matters often have the most serious significance and might induce people who disregard the psychology of the unconscious to believe in omens. It is not a happy beginning when a young bride loses her wedding-ring on the honeymoon; but after all it is usually only mislaid and is soon found again. - I know a lady, now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. - I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I felt a cold chill as I heard the story, but I did not dare to draw the inference. The little incident only occurred to my mind some years later when the marriage had come to a most unhappy end.

The following observation is quoted from one of Alphonse Maeder's valuable studies, published in French (Maeder, 1906). It might equally well have been included among the examples of forgetting:

'Une dame nous racontait récemment qu'elle avait oublié d'essayer sa robe de noce et s'en souvint la veille du mariage à huit heures du soir; la couturière désespérait de voir sa cliente. Ce détail suffit à montrer que la fiancée ne se sentait pas très heureuse de porter une robe d'épouse, elle cherchait à oublier cette représentation pénible. Elle est aujourd'hui . . . divorcée.'

A friend who has learnt to read signs has told me that the great actress Eleonora Duse introduces into one of her parts a symptomatic act which clearly shows the depths from which she draws her artistry. It is a drama of adultery; she has just had an altercation with her husband and now stands apart deep in thought, before the seducer approaches. During the short interval she plays with her wedding ring, takes it off her finger, puts it on again, and then once more takes it off. She is now ready for the other man.

I add here an account by Theodor Reik (1915) of some other symptomatic acts involving rings.

'We are familiar with the symptomatic acts of married people which consist in their taking off and replacing their wedding rings. My colleague M. produced a series of similar symptomatic acts. He had received a ring as a present from a girl he was in love with, with a note saying that he must not lose it or she would know that he did not love her any more. Subsequently he grew increasingly worried that he might lose the ring. If he had temporarily taken it off (for example while he was washing) it would regularly be mislaid, so that often it could only be found again after a long search. When he was posting a letter he could not suppress a slight fear that the ring might be pulled off by the edges of the letter-box. On one occasion he managed things so clumsily that the ring *did* fall into the box. The letter he was sending off on that occasion was a parting note to an earlier lady-love of his, and he fell guilty towards her. Simultaneously he was filled with a longing for this other lady which conflicted with his feelings towards his present love-object.'

¹ ['A lady was telling us recently how she had forgotten to try on her wedding dress and remembered it at eight o'clock on the eve of her wedding. The dressmaker had given up hope of seeing her customer. This detail was enough to show that the bride did not feel very happy about wearing a wedding-dress; she was trying to forget the painful performance. To-day . . . she is divorced.']

The theme of the ring leaves one once again with the impression of how hard it is for a psycho-analyst to discover anything new that has not been known before by some creative writer. In Fontane's novel *Vor dem Sturm* Justizrat Turgany declares during a game of forfeits: 'You may be sure, ladies, that the deepest secrets of nature are revealed in the pledging of forfeits.' Among the examples he uses to support his claim there is one that deserves our special interest: 'I recall a professor's wife - she had reached the age of *embonpoint* - who again and again pulled off her wedding ring to offer it as a forfeit. Do not ask me to describe the happiness of her marriage.' He then went on: 'In the same company there was a gentleman who never tired of depositing his English pocket-knife, with its ten blades, corkscrew and flint and steel, in the ladies' laps, until the bladed monster, after tearing several silk dresses, finally disappeared amid general cries of indignation.'

We shall not be surprised if an object of such rich symbolic meaning as a ring should be made to play a part in some significant parapraxes, even where it does not, in the form of a wedding ring or an engagement ring, mark an erotic tie. The following example of an occurrence of this sort has been put at my disposal by Dr. M. Kardos:

'Several years ago a man who is much my junior attached himself to me; he shares my intellectual endeavours and stands to me somewhat in the relation of a pupil to his teacher. On one particular occasion I presented him with a ring; and this ring has several times given rise to symptomatic acts or parapraxes, whenever anything in our relationship has met with his disapproval. A short time ago he was able to report the following case, which is particularly neat and transparent. We used to meet once a week, when he regularly came to see me and talk with me; but on one occasion he made an excuse to stay away, as a *rendezvous* with a young lady seemed more attractive to him. The following morning he noticed - not, however, until long after he had left the house - that the ring was not on his finger. He did not worry any more about it, since he assumed he had left it behind on his bedside table, where he put it every evening, and would find it there when he got home. As soon as he reached home he looked for it, without success, and then began a systematic search of the room, which was equally fruitless. At last it crossed his mind that the ring had been lying on the bedside table - just as had been the case, in fact, for more than a year - beside a small pocket-knife that he normally carried in his waistcoat pocket; the suspicion thus occurred to him that he might have "absent-mindedly" pocketed the ring with the knife. So he felt in his pocket and found that the missing ring was in fact there. "His wedding-ring in his waistcoat pocket" is a proverbial way of referring to the place where the ring is kept by a husband who intends to betray the wife who gave it to him. My friend's feeling of guilt had therefore caused him first to punish himself ("you no longer deserve to wear this ring") and secondly to confess his unfaithfulness, though only in the form of an unwitnessed parapraxis. It was only in a roundabout way, while he was describing this parapraxis - an eventuality which could, incidentally, have been foreseen - that he came to confess his little "unfaithfulness".'

I also know of an elderly man who married a very young girl and who decided to spend the wedding night in a hotel in town instead of on the honeymoon journey. Hardly had they reached the hotel when he noticed in alarm that he was without his wallet, which contained all the money for the honeymoon; he had either mislaid it or lost it. He was still able to reach his servant by telephone; the latter found the missing wallet in the discarded wedding suit and brought it to the hotel to the waiting bridegroom who had accordingly entered upon his marriage without means. He was thus able to start his journey with his young bride next morning. In the night, however, he had, as he had apprehensively foreseen, proved 'incapable'.¹

¹ ['*Unvermögend*', 'without means', 'without power', and so 'impotent'.]

It is consoling to reflect that there is an unsuspected extension of the human habit of 'losing things' - namely, symptomatic acts, and that this habit is consequently welcome, at least to a secret intention of the loser's. It is often only an expression of the low estimation in which the lost object is held, or of a secret antipathy towards it or towards the person that it came from; or else the inclination to lose the object has been transferred to it from other more important objects by a symbolic association of thoughts. Losing objects of value serves to express a variety of impulses; it may either be acting as a symbolic representation of a repressed thought - that is, it may be repeating a warning that one would be glad enough to ignore -, or (most commonly of all) it may be offering a sacrifice to the obscure powers of destiny to whom homage is still paid among us to-day.

Here are a few examples to illustrate these remarks about losing things.

Dr. B. Dattner: 'A colleague told me he had unexpectedly lost his "Penkala" pencil which he had had for over two years and which he valued highly because of its superior quality. Analysis revealed the following facts. The day before, my colleague had received a thoroughly disagreeable letter from his brother-in-law, which concluded with the sentence: "I have neither the inclination nor the time at present to encourage you in your frivolity and laziness." The affect connected with this letter was so powerful that next day my colleague promptly sacrificed the pencil, *which was a present from this brother-in-law*, so as not to feel under too great an obligation to him.'

A lady of my acquaintance understandably refrained from visiting the theatre while in mourning for her old mother. There were only a few days still to elapse before the end of her year of mourning, and she allowed herself to be persuaded by her friends to buy a ticket for a particularly interesting performance. On reaching the theatre she made the discovery that she had lost the ticket. She thought afterwards that she had thrown it away with her tram ticket on leaving the tram. This lady used to pride herself on never losing anything through carelessness.

It is therefore fair to assume that another experience she had of losing something was not without a good reason either. On her arrival at a health resort she decided to pay a visit to a pension where she had stayed on an earlier occasion. She was welcomed there as an old friend and entertained, and when she wanted to pay she was told she was to look on herself as a guest; but this she did not feel was quite proper. It was agreed that she might leave something for the maid who had waited on her, so she opened her purse to put a one mark note on the table. In the evening the pension's manservant brought her a five mark note which had been found under the table and which the proprietress thought must belong to the lady. She must therefore have dropped it from her purse in getting out the tip for the maid. She had probably wanted to pay her bill in spite of everything.

An article of some length by Otto Rank (1911) makes use of dream-analysis to expose the sacrificial mood that forms the basis of this act, and to reveal its deeper motives.¹ It is of interest when he writes later that often not only losing objects but also, *finding* them appears to be determined. In what sense this is to be understood may be gathered from his story, which I include here (Rank, 1915a). It is obvious that in cases of losing, the object is already provided; in cases of finding, it has first to be looked for.

'A girl who was materially dependent on her parents wished to buy a piece of cheap jewellery. She enquired in the shop about the price of the article she fancied, but was disappointed to find that it cost more than the sum she had saved. All the same, it was only a matter of two kronen that stood between her and this small pleasure. In a depressed mood she began to stroll home through the streets, which were thronged with the evening crowds. Though she describes herself as having been deep in thought, she suddenly noticed lying on the ground, in one of the busiest squares, a small piece of paper which she had just passed by without attending to it. She turned round, picked it up and was astonished to find it was a folded two kronen note. She thought: "This has been sent me by fate so that I can buy the jewellery", and started happily back with the idea of taking the hint. But at the same moment she told herself that she ought not to do so, since money that one finds is lucky money and should not be spent.

'The bit of analysis which would make this "chance action" intelligible may probably be inferred from the situation described, even in the absence of personal information from the girl herself. Among the reflections that occupied her mind as she was walking home, the thought of her poverty and her restricted material position must no doubt have bulked large; moreover we may guess that that thought took the form of a wishful removal of her straitened circumstances. The idea of how the required sum could most easily be obtained will surely have arisen from her interest in satisfying her modest wish; and it will have suggested the simplest solution - namely, that of finding the money. In this way her unconscious (or preconscious) was predisposed towards "finding", even though - owing to claims on her attention from other quarters ("deep in thought") - the actual thought did not become fully conscious to her. We may go further and, on the strength of similar cases which have been analysed, actually assert that *unconscious* "readiness to look for something" is much more likely to lead to success than consciously directed attention. Otherwise it would be almost impossible to explain how it was that precisely this one person out of the many hundreds of passers-by - and with all the difficulties caused by the poor street-lighting and the dense crowds - was able to make the find that came as a surprise to her herself. Some indication of the actual strength of this unconscious or preconscious readiness may be obtained from the remarkable fact that *after* making this find - that is, at a time when the attitude had become superfluous and had certainly been removed from conscious attention - the girl found a handkerchief at a later point on her way home, in a dark and lonely part of a suburban street.'

¹ [Footnote added 1917:] Other articles on the same topic will be found in the *Zentralblatt für Psychoanalyse*, **2**, and in the *Internationale Zeitschrift für Psychoanalyse*, **1** (1913).

It must be said that it is precisely such symptomatic acts that often offer the best approach to an understanding of people's intimate mental life.

Turning now to the chance actions that occur sporadically, I will report an example which suggested a comparatively deep interpretation even without analysis. It gives a clear illustration of the conditions under which such symptoms can be produced entirely unobtrusively, and it enables me to subjoin a remark of practical importance. In the course of a summer holiday it happened that I had to wait a few days at a particular place for the arrival of my travelling companion. In the meantime I made the acquaintance of a young man who also seemed to be lonely and was willing enough to join me. As we were staying at the same hotel it was natural for us to take all our meals and walks together. On the afternoon of the third day he suddenly told me that he was expecting his wife to arrive by train that evening. My psychological interest was now aroused, for I had already been struck that morning by my companion's rejecting my proposal for a longish expedition and objecting during our short walk to taking a certain path which he said was too steep and dangerous. On our afternoon walk he suddenly remarked that I must no doubt be hungry; I must certainly not delay my evening meal on his account - he was going to wait for his wife to arrive and have supper with her. I took the hint and sat down to dinner while he went to the station. Next morning we met in the hall of the hotel. He introduced me to his wife and then said: 'You'll have breakfast with us, won't you?' I had first to go on a small errand in the next street, but promised to be back soon. When I entered the breakfast room, I saw that the couple were both sitting on the same side of a small table by the window. On the opposite side there was only one chair; the husband's big, heavy waterproof cape had been hung over the back of it, covering the seat. I understood very well the meaning of the coat's being arranged in that way; it had certainly not been done deliberately and was therefore all the more expressive. It meant: 'There's no room for you here, you're superfluous now.' The husband failed to notice that I was standing in front of the table without sitting down; but his wife did, and quickly nudged her husband and whispered: 'Look, you've taken up the gentleman's seat.'

This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychical processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of his kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes, the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept *γνώθι σεαυτόν*¹ runs *viâ* the study of one's own apparently accidental actions and omissions.

¹ ['Know thyself']

Of all the writers who have from time to time passed comment on our minor symptomatic acts and parapraxes, or who have made use of them, none has understood their secret nature so clearly or exhibited them in so uncannily lifelike a manner as Strindberg - a man whose genius in recognizing such things was, it is true, assisted by grave mental abnormality. Dr. Karl Weiss of Vienna (1913) has drawn attention to the following passage in one of his works:

'After a while the Count did in fact come, and he approached Esther quietly, as though he had a *rendezvous* with her.

"Have you been waiting long?" he asked in his low voice.

"Six months, as you know," answered Esther; "but did you see me to-day?"

"Yes, just now, in the tram: and I looked into your eyes feeling that I was talking to you."

"A great deal has 'happened' since the last time."

"Yes, and I believed it was all over between us."

"How so?"

"All the little gifts that I had from you broke in pieces - in an occult way, what is more. But that is something that has been noticed long, long ago."

"Dear me! Now I remember a whole set of events that I took to be accidents. Once I was given a pair of pince-nez by my grandmother, at a time we were good friends. They were made of polished rock-crystal and were excellent for making post-mortems - a real miracle of which I took the greatest care. One day I broke with the old lady and she was angry with me. And during the next post-mortem the lenses happened to fall out for no reason. I thought they were simply broken and sent them to be repaired. But no, they went on refusing to help me; they were put in a drawer and got lost."

"Dear me! Strange that things that concern the eyes should be the most sensitive. I was once given some opera glasses by a friend; they suited my eyes so well that it was a pleasure to use them. This friend and I fell out. You know how it happens without visible cause; it seems as though one were not allowed to be in harmony. The next time I wanted to use the opera glasses I could not see clearly. The cross-piece was too short and I saw two images. I don't need to tell you that the cross-piece had not grown shorter and my eyes had not grown further apart! It was a miracle that happens every day - one that bad observers do not notice. How can we explain it? *The psychical power of hatred must be greater than we suppose.* - What is more, the ring that I had from you has lost its stone and will not let itself be repaired; no, it will not. Do you want to part from me, then? . . ." (*The Gothic Rooms*, German trans., p. 258 f.)

In the field of symptomatic acts, too, psycho-analytic observation must concede priority to imaginative writers. It can only repeat what they have said long ago. Wilhelm Stross has drawn my attention to the following passage in Laurence Sterne's celebrated humorous novel, *Tristram Shandy* (Volume VI, Chapter V):

' . . . And I am not at all surprised that *Gregory of Nazianzum*, upon observing the hasty and untoward gestures of *Julian*, should foretell he would one day become an apostate; - or that St. *Ambrose* should turn his *Amanuensis* out of doors, because of an indecent motion of his head, which went backwards and forwards like a flail; - or that *Democritus* should conceive *Protagoras* to be a scholar, from seeing him bind up a faggot, and thrusting, as he did it, the small twigs inwards. - There are a thousand unnoticed openings, continued my father, which let a penetrating eye at once into a man's soul; and I maintain it, added he, that a man of sense does not lay down his hat in coming into a room, - or take it up in going out of it, but something escapes, which discovers him.'

I add here a brief and varied collection of symptomatic acts found in healthy and neurotic people:

An elderly colleague who was not a good loser at cards had one evening paid up a largish sum of money that he had lost. He did this without complaining but in a peculiarly restrained mood. After his departure it was discovered that he had left behind at his seat more or less everything he had on him: spectacles, cigar-case and handkerchief. This no doubt calls for the translation: 'You robbers! You have well and truly plundered me!'

A man suffering from occasional sexual impotence, which originated from the intimacy of his relations with his mother in childhood, related that he was in the habit of decorating pamphlets and notes with the letter S, his mother's initial. He cannot bear letters from home coming in contact with other profane correspondence on his desk, and is therefore forced to put the former away separately.

A young lady suddenly flung open the door of the consulting room though the woman who preceded her had not yet left it. In apologizing she blamed her 'thoughtlessness'; it soon turned out that she had been demonstrating the curiosity that in the past had caused her to make her way into her parents' bedroom.

Girls who are proud of having beautiful hair are able to manage their combs and hairpins in such a way that their hair comes down in the middle of a conversation.

Some men scatter small change out of their trouser pockets while they are lying down during treatment and in that way pay whatever fee they think appropriate for the session.

People who forget to take away articles they have brought to the physician's house, such as pince-nez, gloves and purses, are showing by this that they cannot tear themselves away and would like to come back soon. Ernest Jones says: 'One can almost measure the success with which a physician is practising psychotherapy, for instance, by the size of the collection of umbrellas, handkerchiefs, purses, and so on, that he could make in a month.'

The slightest actions of a habitual nature which are performed with a minimum of attention, such as winding up one's watch before going to sleep, switching off the light before leaving a room, etc., are subject from time to time to disturbances that unmistakably demonstrate the influence of unconscious complexes upon what would seem to be the most fixed habits. Maeder, writing in the periodical *Coenobium*, tells of a house-physician who decided to go into town one evening for an important engagement, although he was on duty and was not supposed to leave the hospital. When he returned he was surprised to find the light on in his room. He had forgotten to turn it off when he went out, which was something that he had never failed to do before. But he soon grasped the motive for his forgetfulness. The chief resident medical officer in the hospital would naturally have concluded from the light in the house-physician's room that he was at home.

A man overburdened with worries and subject to occasional depressions assured me that he regularly found in the morning that his watch had run down whenever the evening before life had seemed to be altogether too harsh and unfriendly. By omitting to wind up his watch he was giving symbolic expression to his indifference about living till the next day.

Another man, whom I do not know personally, writes: 'After fate had dealt me a hard blow, life seemed so harsh and unfriendly that I imagined I had not sufficient strength to live through the next day. I then noticed that almost every day I forgot to wind up my watch. Previously I had never failed to do so; it was something I did regularly before going to bed, as an almost mechanical and unconscious act. But now I only very rarely remembered to do it, and that was when I had something important or specially interesting ahead of me. Should this too be considered a symptomatic act? I could not explain it to myself at all.'

If anyone takes the trouble, as Jung (1907) and Maeder (1909) have done, to note the tunes that he finds himself humming, unintentionally and often without noticing he is doing so, he will pretty regularly be able to discover the connection between the words of the song and a subject that is occupying his mind.

The subtler determinants, too, of the expression of one's thoughts in speaking or writing deserve careful attention. We believe that in general we are free to choose what words we shall use for clothing our thoughts or what images for disguising them. Closer observation shows that other considerations determine this choice, and that behind the form in which the thought is expressed a glimpse may be had of a deeper meaning - often one that is not intended. The images and turns of phrase to which a person is particularly given are rarely without significance when one is forming a judgement of him; and others often turn out to be allusions to a theme which is being kept in the background at the time, but which has powerfully affected the speaker. In the course of some theoretical discussions I heard someone at a particular time repeatedly using the expression: 'If something suddenly shoots through one's head'. I happened to know that he had recently received news that a Russian bullet had passed right through the cap hat his son was wearing on his head.'

CHAPTER X

ERRORS

Errors of memory are distinguished from forgetting accompanied by paramnesia by the single feature that in the former the error (the paramnesia) is not recognized as such but finds credence. The use of the term 'error', however, seems to depend on yet another condition. We have remembered it wrongly. We speak of 'being in error' rather than of 'remembering wrongly' where we wish to emphasize the characteristic of objective reality in the psychical material which we are trying to reproduce - that is to say, where what we are trying to remember is something different from a fact of our own psychical life: something, rather, that is open to confirmation or refutation by the memory of other people. The antithesis to an error of memory in this sense is ignorance.

In my *Interpretation of Dreams* (1900a) I was responsible for a number of falsifications which I was astonished to discover after the book was published. They concerned historical points and, in general, points of fact. After closer examination I found that they did not owe their origin to my ignorance, but are traceable to errors of memory which analysis is able to explain.

(1) On page 979 I refer to the town of *Marburg* - a name also found in Styria - as Schiller's birthplace. The error occurs in the analysis of a dream which I had during a journey by night and from which I was woken by the guard calling out the name of Marburg station. In the content of the dream someone asked a question about a book by Schiller. In fact Schiller was not born at the university town of Marburg [in Hesse] but at *Marbach* in Swabia. Moreover I can assert that I have always known this.

(2) On page 681 Hannibal's father is called *Hasrubal*. This error annoyed me especially, but it furnished me with the strongest corroboration of my view of such errors. There must be few readers of my book who are better acquainted with the history of the house of Barca than its author, who penned this error and who overlooked it in three sets of proofs. The name of Hannibal's *father* was *Hamilcar Barca* - *Hasrubal* was the name of Hannibal's *brother*, as well as of his brother-in-law and predecessor in command.

(3) On pages 735 and 1043 I state that Zeus emasculated his father Kronos and dethroned him. I was, however, erroneously carrying this atrocity a generation forward; according to Greek mythology it was Kronos who committed it on his father Uranus.¹

How is it to be explained that my memory provided me at these points with what was incorrect, while otherwise - as the reader of the book can see for himself - it put at my disposal the most out-of-the-way and unusual material? And how, too, did I pass over these errors while I carefully went through three sets of proofs - as if I had been struck blind?

Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.

¹ This was not a complete error. The Orphic version of the myth makes Zeus repeat the process of emasculation on his father Kronos. (See Roscher's *Lexicon of Mythology*.)

(1) Anyone who reads through the dream-analysed on p. 744 will in part find undisguisedly, and will in part be able to guess from hints, that I have broken off at thoughts which would have contained an unfriendly criticism of my father. In the continuation of this train of thoughts and memories there in fact lies an annoying story in which books play a part, and a business friend of my father's who bears the name of *Marburg* - the same name that woke me when it was called out at Marburg station on the *Südbahn*. In the analysis I tried to suppress this Herr Marburg from myself and from my readers; he took his revenge by intruding where he did not belong and changing the name of Schiller's birthplace from *Marbach* to *Marburg*.

(2) The error of putting *Hasrubal* instead of *Hamilcar*, the brother's name instead of the father's, occurred precisely in a context that concerned the Hannibal-phantasies of my school years and my dissatisfaction with my father's behaviour towards the 'enemies of our people'. I could have gone on to tell how my relationship with my father was changed by a visit to England, which resulted in my getting to know my half-brother, the child of my father's first marriage, who lived there. My brother's eldest son is the same age as I am. Thus the relations between our ages were no hindrance to my phantasies of how different things would have been if I had been born the son not of my father but of my brother. These suppressed phantasies falsified the text of my book at the place where I broke off the analysis, by forcing me to put the brother's name for the father's.

(3) It is to the influence of the memory of this same brother that I attribute my error in advancing by a generation the mythological atrocities of the Greek pantheon. One of my brother's admonitions lingered long in my memory. 'One thing,' he had said to me, 'that you must not forget is that as far as the conduct of your life is concerned you really belong not to the second but to the third generation in relation to your father.' Our father had married again in later life and was therefore much older than his children by his second marriage. I made the error already described at the exact point in the book at which I was discussing filial piety.

It has also occasionally happened that friends and patients, whose dreams I have reported, or have alluded to in the course of my dream-analyses, have drawn my attention to the fact that the details of the events experienced by us together have been inaccurately related by me. These again could be classified as historical errors. After being put right I have examined the various cases and here too I have convinced myself that my memory of the facts was incorrect only where I had purposely distorted or concealed something in the analysis. Here once again we find *an unobserved error taking the place of an intentional concealment or repression*.

These errors that derive from repression are to be sharply distinguished from others which are based on genuine ignorance. Thus, for example, it was ignorance which made me think during an excursion to the Wachau that I had come to the home of Fischhof, the revolutionary leader. The two places merely have the same name: Fischhof's Emmersdorf is in Carinthia. I, however, knew no better.

(4) Here is another instructive error that put me to shame, an example of what might be called temporary ignorance. One day a patient reminded me to give him the two books on Venice that I had promised him, as he needed them in preparing for a journey at Easter. 'I have them ready,' I replied, and went to the library to fetch them. The truth, however, was that I had forgotten to look them out, for I did not entirely approve of my patient's journey, which I saw as an unnecessary interruption of the treatment and a material loss to the physician. I therefore took a hasty look round the library for two books I had had my eye on. One was 'Venice, City of Art'; but besides this I thought I must own a historical work in a similar series. Quite right, there it was: 'The Medici'. I took it and brought it to my waiting patient, only ashamedly to acknowledge the error. In reality I of course knew that the Medici have nothing to do with Venice, but for a short time it did not strike me as in any way incorrect. I now had to be fair; as I had so frequently confronted my patient with his own symptomatic acts I could only vindicate my authority in his eyes by being honest and showing him the motives (which I had kept secret) for my disapproval of his journey.

It may, in general, seem astonishing that the urge to tell the truth is so much stronger than is usually supposed. Perhaps, however, my being scarcely able to tell lies any more is a consequence of my occupation with psycho-analysis. As often as I try to distort something I succumb to an error or some other parapraxis that betrays my insincerity, as can be seen in this last example and in the previous ones.

Of all parapraxes errors seem to have the least rigid mechanism. That is to say, the occurrence of an error is a quite general indication that the mental activity in question has had to struggle with a disturbing influence of some sort or other; but the particular form that the error takes is not determined by the quality of the concealed disturbing idea. We may add here retrospectively that the same thing can be assumed to be true of many simple cases of slips of the tongue and pen. Every time we make a slip in talking or writing we may infer that there has been a disturbance due to mental processes lying outside our intention; but it must be admitted that slips of the tongue and of the pen often obey the laws of resemblance, of indolence or of the tendency to haste, without the disturbing element succeeding in imposing any part of its own character on the resulting mistake in speech or writing. It is the compliance of the linguistic material which alone makes the determining of the mistakes possible, and at the same time sets the limits up to which the determining can go.

To avoid confining myself entirely to my own errors, I shall report a few examples that might indeed have been included just as well among slips of the tongue and bungled actions; this is, however, a matter of indifference, since all these forms of parapraxis are equivalent to one another.

(5) I forbade a patient to telephone to the girl he was in love with - but with whom he himself wanted to break off relations - since each conversation served only to renew the struggle about giving her up. He was to write his final decision to her though there were difficulties about delivering letters to her. He called on me at one o'clock to tell me he had found a way of getting round these difficulties, and amongst other things asked if he might quote my authority as a physician. At two o'clock he was occupied in composing the letter that was to end the relationship, when he suddenly broke off and said to his mother who was with him: 'Oh! I've forgotten to ask the professor if I may mention his name in the letter.' He rushed to the telephone, put through his call and said into the instrument: 'May I speak to the professor, please, if he's finished dinner?' In answer he got an astonished: 'Adolf, have you gone mad?' It was the same voice which by my orders he should not have heard again. He had simply 'made an error', and instead of the physician's number he had given the girl's.

(6) A young lady was to pay a visit in the *Habsburgergasse* to a friend, a lady who had recently been married. She spoke about it while the family were at table, but said in error that she had to go to the *Babenbergergasse*. Some of those at the table laughingly drew her attention to her error - or slip of the tongue (according to choice) - which she had not noticed. In fact two days before this the republic had been proclaimed in Vienna; the black and yellow had vanished and been replaced by the colours of the old Ostmark - red, white and red - and the Hapsburgs had been deposed. Our speaker introduced the change of dynasty into her friend's address. In Vienna there is indeed a very well known Babenbergerstrasse, but no Viennese would speak of it as a 'Gasse'.¹

¹ [In Vienna two terms are used for 'street': '*Strasse*' for the more important streets and '*Gasse*' for the minor ones.]

(7) The local school-teacher at a summer resort, a quite poor but handsome young man, persisted in his courtship of the daughter of the proprietor of a villa, who came from the capital, until the girl fell passionately in love with him and even persuaded her family to give their approval to the marriage in spite of the differences in their social position and race. One day the teacher wrote a letter to his brother in which he said: 'The girl is certainly no beauty; but she is very sweet, and it would be all right as far as that goes. But whether I shall be able to make up my mind to marry a Jewess I cannot yet tell you.' This letter was received by his fiancée and it put an end to the engagement, while at the same time his brother was wondering at the protestations of love addressed to him. My informant assured me that this was an error and not a cunning device. I know of another case in which a lady who was dissatisfied with her old doctor but unwilling openly to get rid of him achieved her purpose by mixing up two letters. Here at least I can guarantee that it was error and not conscious cunning that made use of this *motif* which is such a familiar one in comedy.

(8) Brill tells of a lady who asked him for news of a common acquaintance and in doing so called her in error by her maiden name. When her attention was drawn to the mistake she was forced to admit that she disliked the lady's husband and had been very unhappy about her marriage.

(9) Here is an error which can also be described as a slip of the tongue. A young father presented himself before the registrar of births to give notice of the birth of his second daughter. When asked what the child's name was to be he answered: 'Hanna', and had to be told by the official that he already had a child of that name. We may conclude that the second daughter was not quite so welcome as the first had been.

(10) I will add some other observations of confusion between names; they might of course have been equally well included in other chapters of this book.

A lady is the mother of three daughters two of whom have long been married; the youngest is still awaiting her destiny. At both weddings a lady who is a friend of the family gave the same present, an expensive silver tea-service. Every time the conversation turns to this tea-service the mother makes the error of saying that the third daughter owns it. It is clear that this error expresses the mother's wish to see her last daughter married too - on the assumption that she would be given the same wedding present.

The frequent cases in which a mother confuses the names of her daughters, sons or sons-in-law are just as easy to interpret.

(11) Here is a good example of an obstinate interchange of names; I borrow it from a Herr J. G. who made the observation on himself during a stay in a sanatorium:

'At dinner one day (at the sanatorium) I was having a conversation, which did not interest me much and was entirely conventional in tone, with the lady who was next to me at table, when in the course of it I used a phrase of special affability. The somewhat elderly spinster could not help commenting that it was not usually my habit to behave to her with such affability and gallantry - a rejoinder which contained not only a certain regret but also an obvious dig at a young lady we both knew to whom I was in the way of being somewhat attentive. Naturally I understood at once. In the course of our further conversation I had to have it repeatedly pointed out to me by my neighbour, to my great embarrassment, that I had addressed her by the name of the young lady whom she regarded with some justice as her more fortunate rival.'

(12) I will also report as an 'error' an incident with a serious background, which was told me by a witness who was closely involved. A lady spent an evening out of doors with her husband and two strangers. One of these two 'strangers' was an intimate friend of hers; but the others knew nothing of this and were meant to know nothing. The friends accompanied the married couple to the door of their house and while they were waiting for the door to be opened they took their leave of one another. The lady bowed to the stranger, gave him her hand and said a few polite words. Then she took the arm of her secret lover, turned to her husband and began to bid him good-bye in the same way. Her husband entered into the situation, raised his hat and said with exaggerated politeness: 'Good-bye, dear lady!' The horrified wife dropped her lover's arm and before the concierge appeared had time to exclaim: 'Goodness! What a stupid thing to happen!' The husband was one of those married men who want to put an act of infidelity on their wife's part beyond the bounds of possibility. He had repeatedly sworn that in such a case more than one life would be in jeopardy. He therefore had inner impediments of the strongest kind to prevent his noticing the challenge contained in this error.

(13) Here is an error of one of my patients: the fact that it was repeated in order to express a contrary meaning makes it particularly instructive. After protracted internal struggles this over-cautious young man brought himself to the point of proposing marriage to the girl who had long been in love with him, as he was with her. He escorted his *fiancée* home, said good-bye to her, and, in a mood of the greatest happiness, got on to a tram and asked the conductress for *two* tickets. About six months later he had got married but could not yet adjust himself to his conjugal bliss. He wondered whether he had done the right thing in marrying, missed his former relations with his friends, and had every sort of fault to find with his parents-in-law. One evening he fetched his young wife from her parents' house, got on to a tram with her and contented himself with asking for one ticket only.

(14) How a wish that has been reluctantly suppressed can be satisfied by means of an 'error' is described in a good example of Maeder's (1908). A colleague who had a day free from duties wanted to enjoy it without any interruptions; but he was due to pay a visit in Lucerne to which he did not look forward. After long deliberation he decided to go there all the same. He passed the time on the journey from Zurich to Arth-Goldau in reading the daily papers. At the latter station he changed trains and continued reading. He travelled on till the ticket-inspector informed him that he was in the wrong train - the one travelling back from Goldau to Zurich, though he had a ticket for Lucerne.

(15) An analogous, though not entirely successful, attempt to help a suppressed wish to find expression by means of the same mechanism of an error is described by Dr. V. Tausk (1917) under the title of 'Travelling in the Wrong Direction':

'I had come to Vienna on leave from the front. An old patient had heard I was in town and invited me to visit him as he was ill in bed. I complied with his request and spent two hours with him. When I was leaving, the sick man asked how much he owed me. "I am here on leave and am not practising now," I replied. "Please regard my visit as a friendly turn." The patient hesitated, as he no doubt felt he had no right to claim my professional services in the form of an unremunerated act of friendship. But he finally accepted my answer by expressing the respectful opinion, which was dictated by his pleasure at saving money, that as a psycho-analyst I would no doubt do the right thing. A few moments later I myself had misgivings about the sincerity of my generosity, and with my mind full of doubts - which could hardly be explained in more than one way - I got on a tram of route X. After a short journey I had to change on to route Y. While waiting at the point where I was to change I forgot the business of the fee and was occupied with the symptoms of my patient's illness. Meanwhile the tram I was waiting for came and I got on it. But at the next stop I had to get off again. I had in fact inadvertently and without noticing got on to an X tram instead of a Y tram, and had travelled back again in the direction I had just come from - in the direction of my patient from whom I did not wish to accept any fee. *But my unconscious wanted to collect it.*'

(16) A trick very similar to the one in Example 14 was once brought off by me myself. I had promised my strict eldest brother that that summer I would make my long due visit to him at an English seaside resort, and had undertaken, as time was limited, to travel by the shortest route, without breaking my journey anywhere. I asked if I might stop for a day in Holland, but he thought I might postpone that till my journey back. So I travelled from Munich *viâ* Cologne to Rotterdam and the Hook of Holland from where the boat starts at midnight for Harwich. I had to change at Cologne; I left my train to change into the Rotterdam express, but it was nowhere to be found. I asked various railway officials, was sent from one platform to another, fell into a mood of exaggerated despair and soon realized that during this fruitless search I must have missed my connection. After this was confirmed I considered whether I should spend the night in Cologne. Among other considerations in favour of that plan was one of filial piety, since according to an old family tradition my ancestors had once fled from that city during a persecution of the Jews. However I decided against it, travelled by a later train to Rotterdam, which I reached late in the night, and was then obliged to spend a day in Holland. That day brought me the fulfilment of a long cherished wish; I was able to see Rembrandt's magnificent paintings at the Hague and in the Rijksmuseum at Amsterdam. It was only the next morning, when I was travelling in the train across England and could collect my impressions, that a clear memory emerged of my having seen a large notice in the station at Cologne - a few steps from the place where I had got off the train and on the same platform - which read 'Rotterdam-Hook of Holland'. There, waiting for me, had been the train in which I ought to have continued my journey. My action in hurrying away in spite of this clear direction, and my search for the train in another place, would have to be described as an incomprehensible 'blindness' unless one is prepared to assume that - contrary to my brother's instructions - I had really resolved to admire the Rembrandts on the journey out. Everything else - my well-acted perplexity, the emergence of the 'pious' intention to spend the night in Cologne - was merely a contrivance to keep my resolution hidden from myself till it had been completely carried out.

(17) From his own personal experience J. Störcke (1916) tells of a similar device produced by 'forgetfulness' for the purpose of fulfilling an ostensibly renounced wish.

'I once had to give a lecture with lantern slides at a village; but the lecture was postponed for a week. I had answered the letter about the postponement and had entered the new date in my notebook. I should have been glad to go to this village in the afternoon, for then I should have had time to pay a visit to a writer I knew who lived there. To my regret, however, I had at the time no afternoon that I could keep free. Somewhat reluctantly, I gave up the idea of the visit.

'When the evening of the lecture arrived I set out for the station in the greatest hurry with a case of lantern slides. I had to take a taxi to catch the train. (It happens frequently with me that I put things off so long that I have to take a taxi if I am to catch my train.) When I reached my destination I was a little surprised that there was no one at the station to meet me (as is the usual practice with lectures in smallish places). It suddenly occurred to me that the lecture had been postponed for a week and that I had made a fruitless journey on the date that had originally been fixed. After I had roundly cursed my forgetfulness, I debated whether I should return home by the next train. However, upon closer consideration I reflected that I now had a fine opportunity of paying the visit I had wanted to, and I thereupon did so. It was only when I was on my way that it struck me that my unfulfilled wish to have sufficient time for this visit had neatly hatched the plot. Being weighed down by the heavy case of lantern slides and hurrying to catch the train could serve excellently to hide the unconscious intention all the more effectively.'

It may perhaps be thought that the class of errors whose explanation I have given here is not very numerous or particularly significant. But I leave it open for question whether there is not some ground for extending the same line of approach to our assessment of the far more important *errors of judgement* made by human beings in their lives and in scientific work. Only for the rarest and best adjusted mind does it seem possible to preserve the picture of external reality, as it is perceived, against the distortion to which it is normally subjected in its passage through the psychical individuality of the percipient.

CHAPTER XI

COMBINED PARAPRAXES

Two of the last-mentioned examples - my own error which transferred the Medici to Venice, and that of the young man who succeeded in getting a conversation with his fiancée on the telephone in defiance of my prohibition - have not in fact been described entirely accurately. Careful consideration reveals that they are a combination of an act of forgetting and an error. I can illustrate this combination still more clearly from some other examples.

(1) A friend tells me of the following experience. 'Some years ago I allowed myself to be elected to the committee of a certain literary society, as I thought that the organization might one day be able to help me to have my play produced; and I took a regular part, though without being much interested, in the meetings, which were held every Friday. Then, a few months ago, I was given the promise of a production at the theatre at F.; and since then I have regularly *forgotten* the meetings of the society. When I read your book on the subject I felt ashamed of my forgetfulness. I reproached myself with the thought that it was shabby behaviour on my part to stay away now that I no longer needed these people, and resolved on no account to forget the next Friday. I kept on reminding myself of this resolution until I carried it into effect and stood at the door of the room where the meetings were held. To my astonishment it was locked; the meeting was over. I had in fact made a mistake over the day; it was now Saturday!'

(2) The next example combines a symptomatic act with a case of mislaying. It reached me in a somewhat roundabout way, but comes from a reliable source.

A lady travelled to Rome with her brother-in-law, who is a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her - how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent off; and it was at this point that the meaning of her 'absent mindedness' dawned on the lady: she wanted to keep the object for herself.

(3) There are some cases in which the parapraxis obstinately repeats itself, at the same time changing the method that it employs:

For reasons unknown to him, Ernest Jones (1911*b*, 483) once left a letter lying on his desk for several days without posting it. At last he decided to send it off, but he had it returned to him from the 'Dead Letter Office' since he had forgotten to address it. After he had addressed it he again took it to the post, but this time it had no stamp. He was then no longer able to overlook his reluctance to sending the letter off at all.

(4) The vain attempts to carry out an action in opposition to an internal resistance are most impressively depicted in a short communication by Dr. Karl Weiss (1912) of Vienna:

'The following episode will show how persistently the unconscious can make itself felt if it has a motive for preventing an intention from being carried out, and how hard it is to guard against that persistence. An acquaintance asked me to lend him a book and to bring it to him the next day. I immediately promised I would, but was aware of a lively feeling of unpleasure which I could not at first explain. Later on it became clear to me: the person in question had for years owed me a sum of money which he apparently had no idea of repaying. I thought no more of the matter, but I remembered it the next morning with the same feeling of unpleasure and at once said to myself "Your unconscious will arrange for you to forget the book; but you don't want to be disobliging, so you will take all possible steps not to forget it." I came home, wrapped up the book and put it beside me on the desk where I write my letters. After some time I went out; I took a few steps and remembered I had left the letters I wanted to post on my desk. (One of them, by the way, was a letter in which I was obliged to write something disagreeable to someone from whom I was hoping to get support over a certain matter.) I turned back, took the letters and again set off. In the tram it occurred to me that I had promised my wife to buy something for her, and I was very pleased with the thought that it would only make a small parcel. At that point the association "parcel"- "book" suddenly occurred to me, and I now noticed that I was not carrying the book. So I had not only forgotten it the first time I went out, but had also persisted in overlooking it when I took the letters that it lay beside.'

(5) The same situation is found in an instance which Otto Rank (1912) analysed exhaustively:

'A scrupulously orderly and pedantically precise man reported the following experience, which was quite unusual for him. One afternoon he was in the street and wanted to know the time; and he found he had left his watch at home - a thing he did not remember ever having done before. As he had an evening engagement for which he had to be punctual, and as he had not enough time to fetch his own watch before it, he took advantage of a visit to a lady, a friend of his, to borrow her watch for the evening. This was all the more feasible since he already had an engagement to visit the lady next morning, and he promised to return the watch on that occasion. Next day, however, when he wanted to hand over the watch he had borrowed to its owner, he found to his astonishment that now he had left *it* at home. This time he had his own watch on him. He then firmly resolved to return the ladies' watch the same afternoon and actually carried out his resolution. But when he wanted to see the time upon leaving her, he found to his immense annoyance and astonishment that he had again forgotten his own watch.

'The repetition of this parapraxis seemed so pathological to a man with his love of orderliness that he would have been glad to learn of its psychological motivation; and this was promptly revealed by the psycho-analytic enquiry as to whether anything disagreeable had happened to him on the crucial day when he was forgetful for the first time, and in what connection it had occurred. He immediately related how after lunch - shortly before he went out forgetting his watch - he had had a conversation with his mother, who told him that an irresponsible relative, who had already caused him much worry and expense, had pawned his [the relative's] watch, but, as it was needed in the house, was asking him [the narrator] to provide the money to redeem it. He was very much upset by what was a more or less forced loan, and it recalled to his mind all the annoyances that the relative had caused him over many years. His symptomatic act therefore proves to have had more than one determinant. In the first place it gave expression to a train of thought that ran somewhat as follows: "I won't allow money to be extorted from me in this way, and if a watch is needed I shall leave my own at home." But since he needed it in the evening for keeping an appointment, this intention could only come into effect by an unconscious path, in the form of a symptomatic act. In the second place, what the act of forgetting signified came to this: "The perpetual sacrifice of money on this good-for-nothing will be the utter ruin of me, so that I shall have to give up everything." Although, according to him, his indignation at this piece of news was only momentary, the repetition of the same symptomatic act nevertheless shows that it continued to operate intensively in the unconscious, somewhat as though his consciousness were saying: "I can't get this story out of my head."¹ In view of this attitude of the unconscious, it will come as no surprise to us that the same thing should have happened to the borrowed ladies' watch. But perhaps there were also special motives that favoured this transference on to the "innocent" ladies' watch. Probably the most obvious motive is that he would no doubt have liked to keep it to take the place of the watch of his own which he had sacrificed, and that he therefore forgot to return it the next day. He would also perhaps have been glad to have the watch as a souvenir of the lady. Furthermore, forgetting the ladies' watch gave him the opportunity of paying the lady he admired a second visit. He was in any case obliged to call on her in the morning in connection with another matter, and by forgetting the watch he seems, as it were, to indicate that it was a shame to use this visit, which had been arranged some time before, for the incidental purpose of returning the watch. Moreover, having twice forgotten his own watch, and in that way being able to return the other watch, goes to show that unconsciously he was trying to avoid carrying both watches at once. He was obviously seeking to avoid giving this appearance of superfluity, which would have been in striking contrast to his relative's want. But on the other hand he contrived by these means to counter his apparent intentions of marrying the lady, by warning himself that he had indissoluble obligations to his family (his mother). Finally, another reason for forgetting a ladies' watch may be sought in the fact that the evening before he had, as a bachelor, felt embarrassment in front of his friends about looking at the ladies' watch, and only did so surreptitiously; and to avoid a repetition of this awkward situation he did not like to carry it any longer. But as he had on the other hand to return it, the result here too was an unconsciously performed symptomatic act, which proved to be a compromise-formation between conflicting emotional impulses, and a dearly-bought victory by the unconscious agency.'

¹ 'The continued operation of an idea in the unconscious manifests itself sometimes in the form of a dream following the parapraxis, and sometimes in a repetition of the parapraxis or in a failure to correct it.'

Here are three cases observed by J. Störcke (1916, 108-9):

(6) *Mislaying, breaking and forgetting as an expression of a counter-will that has been pushed back.* 'I had got together a number of illustrations for a scientific work, when one day my brother asked me to lend him some which he wanted to use as lantern slides in a lecture. Though I was momentarily aware of thinking I would prefer it if the reproductions I had collected at much pains were not exhibited or published in any way before I could do so myself, I promised him I would look out the negatives of the pictures he wanted and make lantern slides from them. These negatives however I was unable to find. I looked through the whole pile of boxes full of the relevant negatives, and a good two hundred negatives passed through my hands, one after the other; but the negatives I was looking for were not there. I had a suspicion that in fact I seemed not to want my brother to have the pictures. After I had made this unfriendly thought conscious and had combated it, I noticed I had put the top box of the pile on one side, and had not looked through it; and this box contained the negatives I was looking for. On the lid of this box there was a brief note of the contents, and it is likely that I had given it a hasty glance before I put the box aside. The unfriendly thought, however, seemed not yet to have been totally subdued, for there were a variety of further happenings before the slides were dispatched. I pressed too hard on one of the slides and broke it, while I was holding it in my hand and was wiping the glass clean. (In the ordinary way I never break a lantern slide like that.) When I had made a new copy of this slide it fell from my hand, and was only saved from being smashed by my stretching out my foot and breaking its fall. When I mounted the lantern slides the whole pile fell to the ground once more, fortunately without any being broken. And finally, several days passed before I actually packed them and sent them off; for though I intended to do so afresh every day, each time I forgot my intention once again.'

(7) *Repeated forgetfulness - eventual performance bungled.* 'One day I had to send a postcard to an acquaintance; but I kept on postponing doing so for several days. I strongly suspected that this was due to the following causes: he had informed me by letter that a certain person would come to see me in the course of the week from whom I was not particularly anxious to have a visit. When the week had passed and the prospect of the unwanted visit had become very slender I finally wrote the post card, in which I informed him when I should be free. When writing the postcard I thought at first of adding that I had been prevented from writing earlier by *druk werk* ("laborious, exacting or burdensome work"); but in the end I did not do so as no reasonable human being believes this stock excuse any longer. Whether this little untruth was nevertheless bound to make its appearance I do not know; but when I pushed the postcard into the letter box I accidentally put it into the lower opening: *Drukwerk* ("printed matter").'

(8) *Forgetting and error.* 'One morning, in very fine weather, a girl went to the Rijksmuseum to draw some plaster-casts there. Though she would have preferred to go for a walk, as the weather was so fine, she nevertheless made up her mind to be industrious for once and to do some drawing. First she had to buy some drawing paper. She went to the shop (about ten minutes' walk from the museum), and bought some pencils and other materials for sketching, but quite forgot to buy the drawing paper. Then she went to the museum, and as she was sitting on her stool ready to begin, she found she had no paper and had to go back to the shop. After fetching some paper she began to draw in earnest, made good progress and, after some time, heard the clock in the museum tower strike a large number of times. "That will be twelve o'clock", she thought, and continued working until the clock in the tower struck the quarter ("that", she thought, "will be a quarter past twelve"), packed up her drawing materials and decided to walk through the Vondelpark to her sister's house and have coffee there (which, in Holland, is equivalent to luncheon). At the Suasso Museum she saw to her astonishment that it was only twelve o'clock, not half past! The temptingly fine weather had got the better of her industriousness, and in consequence she had not recalled, when the clock struck twelve times at half past eleven, that belfry clocks strike the hour at the half hour as well.'

(9) As some of the above instances have already shown, the unconsciously disturbing purpose can also achieve its aim by obstinately repeating the same kind of parapraxis. I borrow an amusing example of this from a small volume, *Frank Wedekind und das Theater*, which has been published in Munich by the Drei Masken Verlag; but I must leave the responsibility for the anecdote, which is told in Mark Twain's manner, to the author of the book.

'In Wedekind's one act play *Die Zensur* [The Censorship] there occurs at its most solemn moment the pronouncement: "The fear of death is an intellectual error ['*Denkfehler*']." The author, who set much store by the passage, asked the performer at rehearsal to make a slight pause before the word "*Denkfehler*". On the night, the actor entered wholeheartedly into his part, and was careful to observe the pause; but he involuntarily said in the most solemn tones: "The fear of death is a *Druckfehler* [a misprint]." In reply to the actor's enquiries at the end of the performance, the author assured him that he had not the smallest criticism to make; only the passage in question did not say that the fear of death is a misprint but that it is an intellectual error. - When *Die Zensur* was repeated on the following night, the actor, on reaching the same passage, declared, and once again in the most solemn tones: "The fear of death is a *Denkzettel* [a memorandum]." Wedekind once more showered unstinted praise on the actor, only remarking incidentally that what the text said was not that the fear of death was a memorandum but that it was an intellectual error. - Next night *Die Zensur* was given again, and the actor, with whom the author had meanwhile struck up a friendship and had exchanged views on artistic questions, declared when he came to the passage, with the most solemn face in the world: "The fear of death is a *Druckzettel* [a printed label]." The actor received the author's unqualified appreciation, and the play was given many more performances; but the author had made up his mind that the notion of an "intellectual error" was a lost cause for good and all.'

Rank (1912 and 1915*b*) has also given attention to the very interesting relations between 'Parapraxes and Dreams', but they cannot be followed without a thorough analysis of the dream which is linked to the parapraxis. I once dreamt, as part of a longish dream, that I had lost my purse. In the morning while I was dressing I found that it was really missing. While undressing the night before I had the dream, I had forgotten to take it out of my trouser pocket and put it in its usual place. I was therefore not ignorant of my forgetfulness and it was probably meant to give expression to an unconscious thought which was prepared for making its appearance in the content of the dream.¹

¹ [*Footnote added 1924:*] It is not so rare an event for a parapraxis like losing or mislaying something to be undone by means of a dream - by one's learning in the dream where the missing object is to be found; but this has nothing about it in the nature of the occult, so long as dreamer and loser are the same person. A young lady writes: 'About four months ago at the bank I lost a very beautiful ring. I hunted in every nook and cranny of my room without finding it. A week ago I dreamt it was lying beside the cupboard by the radiator. Naturally the dream gave me no rest, and next morning I did in fact really find it in that very spot.' She is surprised at this incident, and maintains that it often happens that her thoughts and wishes are fulfilled in this way, but omits to ask herself what change had occurred in her life between the loss and the recovery of the ring.

I do not mean to assert that cases of combined parapraxes like these can teach us anything new that could not already be observed in the simple cases. And yet this situation, of there being a change in the form taken by the parapraxis while the outcome remains the same, gives a vivid impression of a will striving for a definite aim, and contradicts in a far more energetic way the notion that a parapraxis is a matter of chance and needs no interpretation. We may also be struck by the fact that a conscious intention should in these examples fail so completely to prevent the success of the parapraxis. My friend failed in spite of everything to attend the meeting of the society, and the lady found it impossible to part from the medal. The unknown factor that opposed these intentions found another outlet after the first path had been barred to it. For what was required to overcome the unconscious motive was something other than a conscious counter-intention; it called for a piece of psychical work, which could make what was unknown known to consciousness.

CHAPTER XII

DETERMINISM, BELIEF IN CHANCE AND SUPERSTITION - SOME POINTS OF VIEW

The general conclusion that emerges from the previous individual discussions may be stated in the following terms. *Certain shortcomings in our psychical functioning* - whose common characteristics will in a moment be defined more closely - *and certain seemingly unintentional performances prove, if psycho-analytic methods of investigation are applied to them, to have valid motives and to be determined by motives unknown to consciousness.*

In order to be included in the class of phenomena explicable in this way, a psychical parapraxis must fulfil the following conditions:

(a) It must not exceed certain dimensions fixed by our judgement, which we characterize by the expression 'within the limits of the normal'.

(b) It must be in the nature of a momentary and temporary disturbance. The same function must have been performed by us more correctly before, or we must at all times believe ourselves capable of carrying it out more correctly. If we are corrected by someone else, we must at once recognize the rightness of the correction and the wrongness of our own psychical process.

(c) If we perceive the parapraxis at all, we must not be aware in ourselves of any motive for it. We must rather be tempted to explain it by 'inattentiveness', or to put it down to 'chance'.

There thus remain in this group the cases of forgetting ['*Vergessen*'], the errors in spite of better knowledge, the slips of the tongue ['*Versprechen*'], misreadings ['*Verlesen*'], slips of the pen ['*Verschreiben*'], bungled actions ['*Vergreifen*'] and the so-called 'chance actions'. Language points to the internal similarity between most of these phenomena: they are compounded alike [in German] with the prefix '*ver-*'.¹

The explanation of the psychical processes which are defined in this way leads on to a series of observations which should in part excite a wider interest.

¹ [The prefix '*ver-*' in German corresponds closely to the English prefix '*mis-*' in such words as 'mis-hear', 'mis-lay' and 'mis-read'.]

(A) If we give way to the view that a part of our psychical functioning cannot be explained by purposive ideas, we are failing to appreciate the extent of determination in mental life. Both here and in other spheres this is more far-reaching than we suspect. In an article in *Die Zeit* by R. M. Meyer, the literary historian, which I came across in 1900, the view was put forward and illustrated by examples that it is impossible intentionally and arbitrarily to make up a piece of nonsense. I have known for some time that one cannot make a number occur to one at one's own free choice any more than a name. Investigation of a number made up in an apparently arbitrary manner - one, let us say, of several digits uttered by someone as a joke or in a moment of high spirits - reveals that it is strictly determined in a way that would really never have been thought possible. I will begin by briefly discussing an instance of an arbitrarily chosen first name, and then analyse in some detail an analogous example of a number 'thrown out without thinking'.

(1) With a view to preparing the case history of one of my women patients for publication I considered what first name I should give her in my account. There appeared to be a very wide choice; some names, it is true, were ruled out from the start - the real name in the first place, then the names of members of my own family, to which I should object, and perhaps some other women's names with an especially peculiar sound. But otherwise there was no need for me to be at a loss for a name. It might have been expected - and I myself expected - that a whole host of women's names would be at my disposal. Instead, one name and only one occurred to me - the name 'Dora'.

I asked myself how it was determined. Who else was there called Dora? I should have liked to dismiss with incredulity the next thought to occur to me - that it was the name of my sister's nursemaid; but I have so much self-discipline or so much practice in analysing that I held firmly to the idea and let my thoughts run on from it. At once there came to my mind a trivial incident from the previous evening which provided the determinant I was looking for. I had seen a letter on my sister's dining-room table addressed to 'Fräulein Rosa W.'. I asked in surprise who there was of that name, and was told that the girl I knew as Dora was really called Rosa, but had had to give up her real name when she took up employment in the house, since my sister could take the name 'Rosa' as applying to herself as well. 'Poor people,' I remarked in pity, 'they cannot even keep their own names!' After that, I now recall, I fell silent for a moment and began to think of a variety of serious matters which drifted into obscurity, but which I was now easily able to make conscious. When next day I was looking for a name for someone *who could not keep her own*, 'Dora' was the only one to occur to me. The complete absence of alternatives was here based on a solid association connected with the subject-matter that I was dealing with: for it was a person employed in someone else's house, a governess, who exercised a decisive influence on my patient's story, and on the course of the treatment as well.

Years later this little incident had an unexpected sequel. Once, when I was discussing in a lecture the long since published case history of the girl now called Dora, it occurred to me that one of the two ladies in my audience had the same name Dora that I should have to utter so often in a whole variety of connections. I turned to my young colleague, whom I also knew personally, with the excuse that I had not in fact remembered that that was her name too, and added that I was very willing to replace it in my lecture by another name. I was now faced with the task of rapidly choosing another one, and I reflected that I must at all costs avoid selecting the first name of the other lady in the audience and so setting a bad example to my other colleagues, who were already well grounded in psycho-analysis. I was therefore very much pleased when the name 'Erna' occurred to me as a substitute for Dora, and I used it in the lecture. After the lecture I asked myself where the name Erna could possibly have come from, and I could not help laughing when I noticed that the possibility I had been afraid of when I was choosing the substitute name had nevertheless come about, at least to some extent. The other lady's family name was Lucerna, of which Erna is a part.

(2) In a letter to a friend I informed him I had just then finished correcting the proofs of *The Interpretation of Dreams* and did not intend to make any more changes in the work, 'even if it contains 2467 mistakes'. I at once tried to explain this number to myself and added the little analysis as a postscript to my letter. The best plan will be to quote it as I wrote it down at the time, just after I had caught myself in the act:

'Let me hastily add a contribution to the psychopathology of everyday life. You will find that in the letter I put down the number 2467 as a bold arbitrary estimate of the number of mistakes which will be found in the dream book. What I meant was some very big number; but that particular one emerged. However, nothing in the mind is arbitrary or undetermined. You will therefore rightly expect that the unconscious had hastened to determine the number which was left open by consciousness. Now, immediately before, I had read in the newspaper that a General E. M. had retired from the post of Master of Ordnance. I should explain that I am interested in this man. While I was serving as a medical officer-cadet he came to the sick quarters one day (he was then a colonel) and said to the medical officer: 'You must make me well in a week, because I have some work to do for which the Emperor is waiting.' After that episode I decided to follow his career, and lo and behold! now he has reached the end of it, having become Master of Ordnance, and is already (1899) on the retired list. I wanted to work out how long he had taken over this. Assuming that it was in 1882 that I saw him in hospital, it must have been seventeen years. I told my wife this and she remarked: "Oughtn't you to be on the retired list too, then?" "Heaven forbid!" I exclaimed. After this conversation I sat down to write to you. But the earlier train of thought went on in my mind, and with good reason. I had miscalculated; I have a fixed point in my memory to prove it. I celebrated my majority, i. e. my twenty-fourth birthday, under military arrest (having been absent without leave). So that was in 1880, or nineteen years ago. That gives you the "24" in 2467. Now take my present age - 43 - add 24, and you have 67. In other words, in answer to the question whether I meant to retire too, my wish gave me another twenty-four years' work. I was obviously annoyed at having failed to get very far myself during the period in which I have followed Colonel M.'s career; and yet I was celebrating a kind of triumph over his career being at an end, while I still have everything in front of me. So one can say with justice that not even the number 2467 which I threw out unthinkingly was without its determinants from the unconscious.'

(3) Since this first example in which an apparently arbitrarily chosen number was explained I have often repeated the same experiment, and with the same result; but the content of the majority of cases is so intimate that they cannot be reported.

For that very reason, however, I will take the opportunity of adding here a very interesting analysis of a 'numerical association', which Dr. Adler (1905) of Vienna obtained from a 'perfectly healthy' informant. 'Yesterday evening', this informant reports, 'I got down to *The Psychopathology of Everyday Life*, and would have read the whole of the book straight away if I had not been prevented by a remarkable incident. For what happened was that, when I read that every number which we summon seemingly arbitrarily into consciousness has a definite meaning, I decided to make an experiment. There came to my mind the number 1734. The following ideas then rapidly occurred to me: $1734 \div 17 = 102$; $102 \div 17 = 6$. I then divided the number into 17 and 34. I am 34 years old. I believe, as I think I once told you, that 34 is the last year of youth, and for that reason I felt very miserable on my last birthday. The end of my 17th year saw the beginning of a very pleasant and interesting period in my development. I divide my life into portions of 17 years. What do the divisions mean? In thinking of the number 102 it occurred to me that No. 102 in the Reclam Universal Library is Kotzebue's play *Menschenhass und Reue*.

'My present psychical state is one of misanthropy and remorse. No. 6 in the U.L. (I know a whole quantity of its numbers by heart) is Müllner's *Die Schuld* [Guilt]. The thought plagues me constantly that the guilt is mine for my failure to become what I could have been with my abilities. It further occurred to me that No. 34 in the U.L. contains a tale by the same Müllner entitled *Der Kaliber* [The Calibre]. I divided the word into "Ka" and "Liber"; it further occurred to me that it contains the words "Ali" and "Kali" ["potassium"]. This reminded me of my once making up rhymes with my (six-year old) son Ali. I asked him to find a rhyme to Ali. He could not think of any, and as he wanted me to give him one I said: "*Ali reinigt den Mund mit hypermangansaurem Kali.*" ["Ali cleans his mouth with potassium permanganate."] We laughed a lot and Ali was very *lieb* [sweet]. During the last few days I have been obliged to notice with regret that he is "*ka (kein) lieber Ali*" ["not the sweet Ali" ("*ka lieber*" pronounced as "*Kaliber*")].

'I then asked myself: what is No. 17 in the U.L.? but I could not bring it to mind. But I quite certainly knew it earlier, so I assumed I wanted to forget that number. All reflection was in vain. I wanted to go on reading, but I only read mechanically, without understanding a word, as the 17 was tormenting me. I put out the light and continued my search. Finally I came to the conclusion that No. 17 must be a play of Shakespeare's. But which one? I thought of *Hero and Leander* - clearly a stupid attempt on the part of my will to lead me astray. Finally I got up and looked in the catalogue of the U.L.- No. 17 is *Macbeth*. To my bewilderment I was forced to realize that I knew almost nothing at all of the play, although I had given it as much attention as other plays of Shakespeare's. I only thought of: murderer, Lady Macbeth, witches, "fair is foul" and that at one time I had found Schiller's version of Macbeth very fine. There is no doubt then that I wished to forget the play. The further thought occurred to me that 17 and 34 divided by 17 gives the result 1 and 2. Numbers 1 and 2 in the U.L. are Goethe's *Faust*. Formerly I found very much of Faust in myself.'

We must regret that the physician's discretion did not allow us any insight into the significance of this series of associations. Adler observes that the man did not succeed in synthesizing his remarks. They would seem to us scarcely worth reporting if something had not emerged during their continuation which gave us the key to understanding the number 1734 and the whole series of associations.

'This morning indeed I had an experience that strongly supports the correctness of the Freudian view. My wife, whom I had woken up when I got out of bed the night before, asked me why I had wanted the U.L. catalogue. I told her the story. She found it was all hair-splitting, only - a very interesting point - she accepted *Macbeth*, which I had resisted so forcibly. She said that nothing whatever came to her mind when she thought of a number. I answered: "Let us test it." She gave the number 117. I immediately replied: "17 is a reference to what I have told you. Moreover I said to you yesterday that when a wife is in her 82nd year and her husband in his 35th year there is gross incompatibility." For the last few days I have been teasing my wife by saying she is a little old woman of 82. $82 + 35 = 117$.'

Thus the man, who was not able to find determinants for his own number, found the solution at once when his wife gave him a number purporting to be arbitrarily chosen. In reality the wife understood very well what complex her husband's number was derived from, and chose her own number from the same complex - which was certainly common to both of them, for in his case it concerned their relative ages. It is therefore easy for us to translate the number that had occurred to the husband. It expresses, as Adler suggests, a suppressed wish of his which, fully developed, would run: 'Only a wife of 17 is suitable for a man of 34 like me.'

In case anyone should think too lightly of such 'trifles', I may add that I recently learned from Dr. Adler that a year after the publication of this analysis the man was divorced from his wife.¹

Adler gives similar explanations of the origin of obsessive numbers.

¹ In explanation of *Macbeth*, No. 17 in the U. L., Adler informs me that in his seventeenth year this man joined a society of anarchists with regicide as its aim. This was no doubt why the content of *Macbeth* was forgotten. At that time, too, he had invented a code in which letters were replaced by numbers.

(4) Moreover the choice of what have been called 'favourite numbers' is not unrelated to the life of the person concerned and is not without a certain psychological interest. A man who admitted having a special preference for the numbers 17 and 19 was able to specify after a little reflection that at the age of 17 he had gone to the university and so attained the academic freedom he had long desired, and that at 19 he had taken his first long journey and soon after had made his first scientific discovery. But the fixation of this preference occurred a decade later, when the same numbers took on a significance in his erotic life. - Indeed, even those numbers which a person uses especially often in a particular connection, in an apparently arbitrary way, can be traced by analysis to an unexpected meaning. Thus it struck a patient of mine one day that when annoyed he was especially fond of saying: 'I've told you that already from 17 to 36 times', and he asked himself whether there was any motive for it. It at once occurred to him that he was born on the 27th day of the month whereas his younger brother was born on the 26th, and that he had reason to complain that fate so often robbed him of the good things in life in order to bestow them on this younger brother. He therefore represented this partiality on the part of fate by deducting ten from the date of his own birthday and adding it to his brother's. 'I am the elder and yet I am cut short like this.'

(5) I shall dwell longer on analyses of numerical associations, since I know of no other separate observations that would prove so forcefully the existence of highly composite thought-processes which are yet quite unknown to consciousness. At the same time I know of no better example of analyses in which the part contributed by the physician (suggestion) - so often held responsible - is so definitely ruled out. I shall therefore give a report here (with his consent) of the analysis of a number which occurred to a patient of mine. I need only add that he is the youngest child in a large family and at an early age lost his greatly admired father. While he was in a particularly cheerful mood the number 426718 came to his mind, and he asked himself: 'What ideas occur to me in that connection? First of all, a joke I have heard: "When a doctor treats a cold it lasts for 42 days; when it is not treated, it lasts 6 weeks.'" This corresponds to the first figures in the number ($42 = 6 \times 7$). In the stoppage that followed this first solution I drew his attention to the fact that the six-figure number he had chosen contained all the first digits except for 3 and 5. He then immediately found the continuation of the interpretation. 'There are 7 of us brothers and sisters, and I am the youngest. In the order of our age, 3 corresponds to my sister A., and 5 to my brother L.; they were my two enemies. As a child I used to pray to God every night for him to remove these two tormenting spirits from life. It seems to me now that in this choice of numbers I was myself fulfilling this wish; 3 and 5, the wicked brother and the hated sister, are passed over.' - If the number represents the order of your brothers and sisters, what does the 18 at the end mean? There were only 7 of you after all, - 'I have often thought that if my father had lived longer I should not have remained the youngest child. If there had been 1 more we should have been 8 and I should have had a younger child after me to whom I should have played the elder brother.'

With this the number was explained, but we had still to establish the connection between the first part of the interpretation and the second one. This followed very easily from the necessary precondition of the last figures: 'if my father had lived longer'. ' $42 = 6 \times 7$ ' signified derision at the doctors who had not been able to help his father, and, in this form, therefore, it expressed his wish for his father to go on living. The whole number in fact corresponded to the fulfilment of his two infantile wishes about his family circle - that his bad brother and sister should die and that a baby should be born after him, or, expressed in the shortest form: 'If only those two had died instead of my beloved father!'¹

¹ In the interests of simplicity I have omitted some of the patient's intermediate associations which were equally to the point.

(6) Here is a brief example from a correspondent. The manager of a telegraph office in L. writes that his eighteen and-a-half-year-old son, who wants to study medicine, is already taken up with the psychopathology of everyday life, and is trying to convince his parents of the correctness of my assertions. I reproduce one of the experiments he undertook, without expressing an opinion on the discussion attached to it.

'My son was talking to my wife about what we call "chance" and was demonstrating to her that she could not name any song or any number that really occurred to her simply "by chance". The following conversation ensued. Son: "Give me any number you like." - Mother: "79." - Son: "What occurs to you in that connection?" - Mother: "I think of the lovely hat I was looking at yesterday." - Son: "What did it cost?" - Mother: "158 marks." - Son: "That explains it: $158 \div 2 = 79$. The hat was too dear for you and no doubt you thought: 'If it were half the price, I would buy it.'"

'To these assertions of my son's I first raised the objection that women are not in general particularly good at figures and that anyway his mother had certainly not worked out that 79 was half 158. His theory was therefore based on the sufficiently improbable fact that the subconscious is better at arithmetic than normal consciousness. "Not at all", was the answer I received; "it may well be that my mother did not work out the sum $158 \div 2 = 79$, she may perfectly well have happened to see this equation - indeed she may have thought about the hat while dreaming and then realized what it would cost if it were only half the price.'"

(7) I take another numerical analysis from Jones (1911*b*, 478). A gentleman of his acquaintance let the number 986 occur to him and then defied Jones to connect it with anything he thought of. 'Using the free-association method he first recalled a memory, which had not previously been present in his mind, to the following effect: Six years ago, on the hottest day he could remember, he had seen a joke in an evening newspaper, which stated that the thermometer had stood at 986° F., evidently an exaggeration of 98. 6° F. We were at the time seated in front of a very hot fire from which he had just drawn back, and he remarked, probably quite correctly, that the heat had aroused this dormant memory. However, I was curious to know why this memory had persisted with such vividness as to be so readily brought out, for with most people it surely would have been forgotten beyond recall, unless it had become associated with some other mental experience of more significance. He told me that in reading the joke he had laughed uproariously, and that on many subsequent occasions he had recalled it with great relish. As the joke was obviously a very tenuous one, this strengthened my expectation that more lay behind. His next thought was the general reflection that the conception of heat had always greatly impressed him; that heat was the most important thing in the universe, the source of all life, and so on. This remarkable attitude of a quite prosaic young man certainly needed some explanation, so I asked him to continue his free associations. The next thought was of a factory-stack which he could see from his bedroom window. He often stood of an evening watching the flame and smoke issuing out of it, and reflecting on the deplorable waste of energy. Heat, fire, the source of life, the waste of vital energy issuing from an upright, hollow tube - it was not hard to divine from such associations that the ideas of heat and fire were unconsciously linked in his mind with the idea of love, as is so frequent in symbolic thinking, and that there was a strong masturbation complex present, a conclusion which he presently confirmed.'

Those who wish to get a good impression of the way in which the material of numbers is worked over in unconscious thinking may be referred to the papers by Jung (1911) and Jones (1912).

In analyses of this kind which I conduct on myself I find two things particularly striking: firstly, the positively somnambulistic certainty with which I set off for my unknown goal and plunge into an arithmetical train of thought which arrives all at once at the desired number, and the speed with which the entire subsequent work is completed; and secondly, the fact that the numbers are so freely at the disposal of my unconscious thinking, whereas I am a bad reckoner and have the greatest difficulties in consciously noting dates, house numbers and such things. Moreover in these unconscious thought-operations with numbers I find I have a tendency to superstition, whose origin for long remained unknown to me.¹

¹ [Footnote added 1920:] Herr Rudolf Schneider (1920) of Munich has raised an interesting objection to the conclusiveness of such analyses of numbers. He experimented with numbers that were presented to him - for example, with the number that first caught his eye when he opened a history book - or he presented someone else with a number he had chosen; and he then noticed whether associations emerged to the imposed number which had the appearance of having determined it. This was in fact what did happen. In one instance which he relates that concerned himself, the associations provided determinants just as abundant and full of meaning as in our analyses of numbers that have arisen spontaneously, whereas the number in Schneider's experiments, having been presented from outside, called for no determinant. In a second experiment carried out on someone else, he clearly made the problem too easy, for the number he set him was 2, and everybody has some material which would enable him to find a determinant for that number. - From his experiments Schneider then draws two conclusions: first, that 'the mind possesses the same potentialities for finding associations to numbers as to concepts'; and secondly, that the emergence of determining associations to numbers that occur to the mind spontaneously does not in any way prove that these numbers originated from the thoughts discovered in the 'analysis' of them. The former conclusion is undoubtedly correct. It is just as easy to find an appropriate association to a number which is presented as it is to a word which is called out - indeed it is perhaps easier, since the ability of the few digits to form connections is particularly great. The situation in which one finds oneself is then simply that of what are called 'association experiments', which have been studied from the greatest variety of angles by the school of Bleuler and Jung. In this situation the association (reaction) is determined by the word presented (stimulus-word). This reaction could however still be of very diverse kinds, and Jung's experiments have shown that even these further distinctions are not left to 'chance', but that unconscious 'complexes' participate in the determination if they have been touched on by the stimulus-word. - Schneider's second conclusion goes too far. The fact that appropriate associations arise to numbers (or words) which are *presented* tells us nothing more about the origin of numbers (or words) which emerge *spontaneously* than could already be taken into consideration before that fact was known. These spontaneous ideas (words or numbers) may be undetermined, or may have been determined by the thoughts that come out in the analysis, or by other thoughts not disclosed in the analysis - in which last case the analysis will have led us astray. The important thing is to get rid of the impression that this problem is different for numbers from what it is for verbal associations. A critical examination of the problem and with it a justification of the psycho-analytic technique of association lie outside the scope of this book. In analytic practice we proceed on the presupposition that the second of the possibilities mentioned above meets the facts and that in the majority of instances use can be made of it. The investigations of an experimental psychologist (Poppelreuter [1914]) have demonstrated that it is by far the most probable one. See further in this connection the valuable findings in Section 9 of Bleuler's book on autistic thinking (1919).

It will not surprise us to find that not only numbers but also verbal associations of another kind regularly prove on analytic investigation to be fully determined.

(8) A good example of the derivation of an obsessive word - a word that cannot be got rid of - is to be found in Jung (1906). 'A lady told me that for some days the word "Taganrog" had been constantly on her lips without her having any idea where it came from. I asked the lady for information about the affectively stressed events and repressed wishes of the very recent past. After some hesitation she told me that she would very much like a morning gown, but her husband did not take the interest in it that she had hoped. "*Morgenrock*", "*Tag-an-rock*" - their partial similarity in sound and meaning is obvious. The Russian form was determined by the fact that at about the same time the lady had come to know someone from Taganrog.'

(9) I am indebted to Dr. E. Hitschmann for the elucidation of another case, in which in a particular locality a line of poetry repeatedly forced its way up as an association, without its origin and connections having been apparent.

'E., a doctor of law, relates: Six years ago I travelled from Biarritz to San Sebastian. The railway line crosses the River Bidassoa, which at this point forms the frontier between France and Spain. From the bridge there is a fine view - on one side, of a broad valley and the Pyrenees, and on the other, of the distant sea. It was a beautiful, bright summer's day; everything was filled with sun and light, I was on my holiday travels and was happy to be coming to Spain. At that point the following lines occurred to me:

Aber frei ist schon die Seele,
Schwebet in dem Meer von Licht.¹

'I recall that at the time I pondered on where the lines came from and could not recollect the place. To judge by the rhythm the words must have come from a poem, which, however, had entirely escaped my memory. I believe that later, when the lines came to my mind repeatedly, I asked a number of people about them without being able to learn anything.

'Last year, when I was returning from Spain I passed over the same stretch of railway. It was a pitch-dark night and it was raining. I looked out of the window to see whether we were already coming into the frontier station, and noticed that we were on the Bidassoa bridge. Immediately the lines given above returned to my memory, and again I could not recall their origin.

'Several months later when I was at home, I came across a copy of Uhland's poems. I opened the volume and my glance fell on the lines: "Aber frei ist schon die Seele, schwebet in dem Meer von Licht", which form the conclusion of a poem called "Der Waller". I read the poem and had a very dim recollection of having once known it many years ago. The scene of action is in Spain and this seemed to me to form the only connection between the quoted lines and the place on the railway line described by me. I was only half satisfied with my discovery and went on mechanically turning the pages of the book. The lines "Aber frei ist schon . . ." etc. are printed at the bottom of a page. On turning over the page I found a poem on the other side with the title "Bidassoa Bridge".

'I may add that the contents of this poem seemed almost more unfamiliar than those of its predecessor, and that its first lines run:

'Auf der Bidassoa-brücke steht ein Heiliger altersgrau,
Segnet rechts die span'schen Berge, segnet links den fränk'schen Gau.'²

¹ ['But the soul is already free, it floats in the sea of light.']

² ['On the Bidassoa bridge there stands a saint grey with age: on the right he blesses the Spanish mountains, on the left he blesses the Frankish land.']

(B) Perhaps the insight we have gained into the determining of names and numbers that are chosen with apparent arbitrariness may help to solve another problem. Many people, as is well known, contest the assumption of complete psychical determinism by appealing to a special feeling of conviction that there is a free will. This feeling of conviction exists; and it does not give way before a belief in determinism. Like every normal feeling it must have something to warrant it. But so far as I can observe, it does not manifest itself in the great and important decisions of the will: on these occasions the feeling that we have is rather one of psychical compulsion, and we are glad to invoke it on our behalf. ('Here I stand: I can do no other.') On the other hand, it is precisely with regard to the unimportant, indifferent decisions that we would like to claim that we could just as well have acted otherwise: that we have acted of our free - and unmotivated - will. According to our analyses it is not necessary to dispute the right to the feeling of conviction of having a free will. If the distinction between conscious and unconscious motivation is taken into account, our feeling of conviction informs us that conscious motivation does not extend to all our motor decisions. *De minimus non curat lex*. But what is thus left free by the one side receives its motivation from the other side, from the unconscious; and in this way determination in the psychical sphere is still carried out without any gap.¹

¹ [Footnote added 1907:] These conceptions of the strict determination of apparently arbitrary psychical acts have already borne rich fruit in psychology, and perhaps also in the juridical field. By applying them, Bleuler and Jung have made intelligible the reactions in what is known as the 'association experiment', in which the subject of the test, when he hears a word called out (the stimulus-word), answers it with one that comes to his mind in connection with it (the reaction), the intervening time being measured (the reaction-time). In his *Studies in Word Association* (1906), Jung has shown what a subtle reagent for psychical states we possess in the association experiment as thus interpreted. Wertheimer and Klein, both pupils of Hans Gross, the Professor of Criminal Law in Prague, have developed out of these experiments a technique for the establishment of the facts in criminal proceedings which is at present being examined by psychologists and jurists.

(C) Although the motivation of the parapraxes described in the preceding chapters is something of which from the very nature of the case conscious thought must lack knowledge, it would nevertheless be desirable to discover a psychological proof of the existence of that motivation; indeed, for reasons which a closer knowledge of the unconscious reveals, it is probable that such proofs are somewhere discoverable. There are in fact two spheres in which it is possible to demonstrate phenomena that appear to correspond to an unconscious, and therefore displaced, knowledge of that motivation.

(a) A striking and generally observed feature of the behaviour of paranoics is that they attach the greatest significance to the minor details of other people's behaviour which we ordinarily neglect, interpret them and make them the basis of far-reaching conclusions. For example, the last paranoic seen by me concluded that there was a general understanding in his environment, because when his train was moving out of the station the people had made a particular movement with one hand. Another noted the way people walked in the street, how they flourished their walking sticks, and so on.¹

The category of what is accidental and requires no motivation, in which the normal person includes a part of his own psychical performances and parapraxes, is thus rejected by the paranoic as far as the psychical manifestations of other people are concerned. Everything he observes in other people is full of significance, everything can be interpreted. How does he reach this position? Probably here as in so many similar cases he projects on to the mental life of other people what is unconsciously present in his own. In paranoia many sorts of things force their way through to consciousness whose presence in the unconscious of normal and neurotic people we can demonstrate only through psycho-analysis.² In a certain sense, therefore, the paranoic is justified in this, for he recognizes something that escapes the normal person: he sees more clearly than someone of normal intellectual capacity, but the displacement on to other people of the state of affairs which he recognizes renders his knowledge worthless. I hope I shall not now be expected to justify the various paranoic interpretations. But the partial justification which we concede to paranoia in respect of this view taken by it of chance actions will help us towards a psychological understanding of the sense of conviction that the paranoic attaches to all these interpretations. *There is in fact some truth in them*; those, too, of our errors of judgement which are not to be counted as pathological acquire their sense of conviction in just the same way. This feeling is justified for a certain part of the erroneous train of thought, or for its source of origin; and it is then extended by us to the rest of the context.

¹ From other points of view this interpretation of immaterial and accidental indications given by other people has been classed as a 'delusion of reference'.

² For example, the phantasies of hysterics concerning sexual and cruel maltreatment correspond, at times even down to details, with the complaints of persecuted paranoics. It is curious, but not unintelligible, that we meet the identical content in the form of reality in the contrivances of pervers for the satisfaction of their desires.

(b) Another indication that we possess unconscious and displaced knowledge of the motivation in chance actions and parapraxes is to be found in the phenomenon of superstition. I will make my meaning clear by a discussion of the small experience that started me on these reflections.

On my return from my holidays my thoughts immediately turned to the patients who were to claim my attention in the year's work that was just beginning. My first visit was to a very old lady for whom I had for many years performed the same professional services twice every day (p. 1245). Owing to the uniformity of the circumstances, unconscious thoughts have very often managed to find expression while I was on my way to the patient and while I was treating her. She is over ninety years old; it is therefore natural to ask oneself at the beginning of each year's treatment how much longer she is likely to live. On the day I am speaking about I was in a hurry and called a cab to take me to her house. Every cabman on the rank in front of my house knew the old lady's address, as they had all often taken me there. But on this day it happened that the cabman did not draw up in front of her house but in front of a house with the same number in a nearby street which ran parallel and was in fact of a similar appearance. I noticed the error and reproached the cabman with it, and he apologized. Now is it of any significance that I was driven to a house where the old lady was not to be found? Certainly not to me, but if I were *superstitious* I should see an omen in the incident, the finger of fate announcing that this year would be the old lady's last. Very many omens recorded by history have been based on a symbolism no better than this. I of course explain the occurrence as an accident without any further meaning.

The case would have been quite different if I had made the journey on foot, and while 'deep in thought', or through 'absent-mindedness' had come to the house in the parallel street instead of the right one. This I should not explain as an accident but as an action that had an unconscious aim and required interpretation. My interpretation of 'going astray' like thus would probably have had to be that I did not expect to see the old lady for much longer.

I am therefore different from a superstitious person in the following way:

I do not believe that an event in whose occurrence my mental life plays no part can teach me any hidden thing about the future shape of reality; but I believe that an unintentional manifestation of my own mental activity *does* on the other hand disclose something hidden, though again it is something that belongs only to my mental life. I believe in external (real) chance, it is true, but not in internal (psychical) accidental events. With the superstitious person it is the other way round. He knows nothing of the motivation of his chance actions and parapraxes, and believes in psychical accidental events; and, on the other hand, he has a tendency to ascribe to external chance happenings a meaning which will become manifest in real events, and to regard such chance happenings as a means of expressing something that is hidden from him in the external world. The differences between myself and the superstitious person are two: first, he projects outwards a motivation which I look for within; secondly, he interprets chance as due to an event, while I trace it back to a thought. But what is hidden from him corresponds to what is unconscious for me, and the compulsion not to let chance count as chance but to interpret it is common to both of us.¹

¹ [Footnote added 1924:] At this point I may quote a neat example which Ossipow (1922) has used for discussing the difference between the superstitious, psycho-analytic and mystical point of view. He had been married in a small Russian provincial town and immediately afterwards started for Moscow with his young wife. At a station two hours before his destination he had a wish to go to the station exit and take a look at the town. The train was due to halt there long enough, as he thought, but when he returned a few minutes later it had already left with his young wife. When he told his old nurse at home of this accident she shook her head and declared: 'No good will come of this marriage.' At the time Ossipow laughed at this prophecy. But when, five months later, he was separated from his wife, he could not avoid in retrospect viewing his action in leaving the train as an 'unconscious protest' against his marriage. Years later, the town where this parapraxis happened took on a great importance for him, as a person lived there with whom fate later linked him closely. This person, and even the fact of this person's existence, had been completely unknown to him at the time. But the *mystical* explanation of his behaviour would be that he had left the Moscow train and his wife at that town because the future that was in store for him in relation to this other person was seeking to declare itself.

I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. *Because* the superstitious person knows nothing of the motivation of his own chance actions, and *because* the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, *is nothing but psychology projected into the external world*. The obscure recognition¹ (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a *supernatural reality*, which is destined to be changed back once more by science into the *psychology of the unconscious*. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform *metaphysics* into *metapsychology*. The gap between the paranoic's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranoics, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected *Weltanschauung* that superstition seems so very much out of place; in the *Weltanschauung* of pre-scientific times and peoples it was justified and consistent.

¹ A recognition which, of course, has nothing of the character of a [true] recognition.

The Roman who gave up an important undertaking if he saw an ill-omened flight of birds was therefore in a relative sense justified; his behaviour was consistent with his premisses. But if he withdrew from the undertaking because he had stumbled on the threshold of his door ('*un Romain retournerait*') he was also in an absolute sense superior to us unbelievers; he was a better psychologist than we are striving to be. For his stumbling must have revealed to him the existence of a doubt, a counter-current at work within him, whose force might at the moment of execution subtract from the force of his intention. For we are only sure of complete success if all our mental forces are united in striving towards the desired goal. How did Schiller's Tell, who hesitated so long to shoot the apple on his son's head, answer the Governor's question why he had provided himself with a second arrow?

Mit diesem zweiten Pfeil durchschoss ich - Euch,
Wenn ich mein liebes Kind getroffen hätte,
Und *Euer* - wahrlich, hätt' ich *nicht* gefehlt.¹

¹ ['With this second arrow I would have transfixed - you, if I had struck my dear child; and *you*, truly, I should *not* have missed.']

(D) Anyone who has had the opportunity of studying the hidden mental impulses of human beings by means of psycho-analysis can also say something new about the *quality* of the unconscious motives that find expression in superstition. It can be recognized most clearly in neurotics suffering from obsessional thinking or obsessional states - people who are often of high intelligence - that superstition derives from suppressed hostile and cruel impulses. Superstition is in large part the expectation of trouble; and a person who has harboured frequent evil wishes against others, but has been brought up to be good and has therefore repressed such wishes into the unconscious, will be especially ready to expect punishment for his unconscious wickedness in the form of trouble threatening him from without.

Though we admit that these remarks of ours in no way exhaust the psychology of superstition, we shall at least have to touch on the question of whether we are to deny entirely that superstition has any real roots: whether there are definitely no such things as true presentiments, prophetic dreams, telepathic experiences, manifestations of supernatural forces and the like. I am far from meaning to pass so sweeping a condemnation of these phenomena, of which so many detailed observations have been made even by men of outstanding intellect, and which it would be best to make the subject of further investigations. We may even hope that some portion of these observations will then be explained by our growing recognition of unconscious mental processes, without necessitating radical alterations in the views we hold to-day. If the existence of still other phenomena - those, for example, claimed by spiritualists - were to be established, we should merely set about modifying our 'laws' in the way demanded by the new discovery, without being shaken in our belief in the coherence of things in the world.

In the compass of these discussions the only answer I can give to the questions raised here is a subjective one - that is, one in accordance with my personal experience. To my regret I must confess that I am one of those unworthy people in whose presence spirits suspend their activity and the supernatural vanishes away, so that I have never been in a position to experience anything myself which might arouse a belief in the miraculous. Like every human being, I have had presentiments and experienced trouble, but the two failed to coincide with one another, so that nothing followed the presentiments, and the trouble came upon me unannounced. During the days when I was living alone in a foreign city - I was a young man at the time - I quite often heard my name suddenly called by an unmistakable and beloved voice; I then noted down the exact moment of the hallucination and made anxious enquiries of those at home about what had happened at that time. Nothing had happened. To balance this, there was a later occasion when I went on working with my patients without any disturbance or foreboding while one of my children was in danger of bleeding to death. Nor have I ever been able to regard any of the presentiments reported to me by patients as veridical. - I must however confess that in the last few years I have had a few remarkable experiences which might easily have been explained on the hypothesis of telepathic thought-transference.

Belief in prophetic dreams can claim many adherents, because it can take support from the fact that a number of things do in reality turn out in the future in the way in which the wish had previously arranged them in the dream.¹ But there is little that is surprising in that, and as a rule, too, there are extensive differences between the dream and its fulfilment, which the dreamer's credulity prefers to neglect. A good example of a dream which may justly be called prophetic was once brought to me for detailed analysis by an intelligent and truthful woman patient. Her story was that she had once dreamt she met a former friend of hers and family doctor in front of a certain shop in a certain street; and that when next morning she went into the Inner Town she in fact met him at the very spot named in the dream. I may observe that no subsequent event proved the importance of this miraculous coincidence,² which could not therefore be accounted for by what lay in the future.

Careful questioning established that there was no evidence of her having had any recollection of the dream on the morning after she dreamt it - that is, until after her walk and the meeting. She could produce no objection to an account of what happened which robbed the episode of anything miraculous and left nothing but an interesting psychological problem. She was walking along the street in question one morning and met her old family doctor in front of a particular shop, and thereupon, on seeing him, she felt convinced that she had dreamt the night before of having this meeting at that precise spot. Analysis was then able to show with great probability how she arrived at this sense of conviction, which, according to general rules, cannot fairly be denied a certain right to be considered authentic. A meeting at a particular place, which has been expected beforehand, amounts in fact to a *rendezvous*. The old family doctor awakened her memory of former days, when meetings with a *third* person, also a friend of the doctor, had played a very important part in her life. Since then she had continued her relations with that gentleman and had waited for him in vain on the day before the dream was supposed to have taken place. If I were able to report the circumstances of the case in greater detail it would be easy for me to show that her illusion, when she saw her friend of former days, of having had a prophetic dream was equivalent to some such remark as this; 'Ah! doctor - you remind me now of past times when I never had to wait in vain for N. if we'd arranged a meeting.'

¹ [Footnote added 1924:] See my paper on 'Dreams and Telepathy' (1922a).

² [The German '*Zusammentreffen*' means both 'coincidence' and 'meeting'.]

The 'remarkable coincidence' of meeting a person we were at that very moment thinking about is a familiar one. I have observed a simple and easily explained example of it in myself, which is probably a good model for similar occurrences. A few days after I had been awarded the title of professor - which carries considerable authority with it in countries under monarchical rule - my thoughts, while I was walking through the Inner Town, suddenly turned to a childish phantasy of revenge directed against a particular married couple. Some months earlier they had called me in to see their little daughter, who had developed an interesting obsessional symptom following upon a dream. I took a great interest in the case, whose genesis I thought I understood. My offer of treatment was however declined by her parents and I was given to understand that they thought of changing over to a foreign authority who effected cures by hypnotism. My present phantasy was that after the total failure of that attempt the parents begged me to start my treatment, saying that now they had complete confidence in me, and so on. I however answered: 'Yes, *now* you have confidence in me - now that I too have become a professor. The title has done nothing to alter my capacities; if you could not make use of me as a university lecturer you can do without me as a professor as well.' - At this point my phantasy was interrupted by a loud 'Good day to you, Professor!' and I looked up and saw walking past me the very married couple on whom I had just taken my revenge by rejecting their offer. Immediate reflection destroyed the impression of something miraculous. I had been walking towards the couple along a wide, straight and almost deserted street; when I was about twenty paces from them I had glanced up for a moment and caught a glimpse of their impressive figures and recognized them, but had set the perception aside - on the pattern of a negative hallucination - for the emotional reasons which then took effect in the phantasy that arose with apparent spontaneity.

Here is another 'resolution of an apparent presentiment', this time from Otto Rank (1912):

'Some time ago I myself experienced an unusual variation of the "remarkable coincidence" of meeting someone one was at the very moment thinking about. Shortly before Christmas I was on my way to the Austro-Hungarian Bank to get some change in the form of ten new silver kronen for giving as presents. While I was absorbed in ambitious phantasies which had to do with the contrast between my small assets and the piles of money stored in the bank building, I turned into a narrow street in which the bank stood. I saw a car standing at the door and many people going in and out. I said to myself: No doubt the cashiers will have time even for my few kronen. In any case I shall be quick about it. I shall put down the banknote I want changed and say "Let me have *gold* please". I immediately noticed my error - I should, of course, have asked for *silver* - and awoke from my phantasies. I was now only a few steps from the entrance and saw a young man coming towards me whom I thought I recognized, but as I am short-sighted I was not yet able to identify him for certain. As he drew nearer I recognized him as a school-friend of my *brother's* called *Gold*. Gold's *brother* was a well-known writer from whom I had expected considerable help at the beginning of my literary career. This help, however, had not been forthcoming and in consequence I failed to win the material success I had hoped for, which had been the subject of my phantasy on the way to the bank. While I was absorbed in my phantasies therefore, I must have unconsciously perceived the approach of Herr Gold; and this was represented in my consciousness (which was dreaming of material success) in such a form that I decided to ask for gold at the counter, instead of the less valuable silver. On the other hand, however, the paradoxical fact that my unconscious is able to perceive an object which my eyes can recognize only later seems partly to be explained by what Bleuler terms "complexive preparedness". This was, as we have seen, directed to material matters and had from the beginning, contrary to my better knowledge, directed my steps to the building where only gold and paper money is changed.'

We must also include in the category of the miraculous and the 'uncanny' the peculiar feeling we have, in certain moments and situations, of having had exactly the same experience once before or of having once before been in the same place, though our efforts never succeed in clearly remembering the previous occasion that announces itself in this way. I am aware that I am merely following loose linguistic usage when I call what arises in a person at such moments a 'feeling'. What is no doubt in question is a judgement, and, more precisely, a perceptual judgement; but these cases have nevertheless a character quite of their own, and we must not leave out of account the fact that what is looked for is never remembered. I do not know whether this phenomenon of '*déjà vu*' has ever been seriously offered in proof of an individual's previous psychical existence; but psychologists have certainly turned their attention to it and have endeavoured to solve the problem in a whole variety of speculative ways. None of the attempted explanations which they have brought forward seems to me to be correct, because none of them takes into consideration anything other than the concomitant manifestations and the conditions which favour the phenomenon. Those psychical processes which according to my observations are alone responsible for the explanation of '*déjà vu*' - namely, unconscious phantasies - are still generally neglected by psychologists even to-day.

It is in my view wrong to call the feeling of having experienced something before an illusion. It is rather that at such moments something is really touched on which we have already experienced once before, only we cannot consciously remember it because it has never been conscious. To put it briefly, the feeling of '*déjà vu*' corresponds to the recollection of an unconscious phantasy. There exist unconscious phantasies (or day-dreams) just as there exist conscious creations of the same kind which everybody knows from his own experience.

I know that the subject would merit the most exhaustive treatment; but I shall here do no more than give the analysis of a single case of '*déjà vu*' where the feeling was characterized by especial intensity and persistence. A lady who is now thirty-seven claimed to have a most distinct memory of having at the age of twelve and a half paid her first visit to some school friends in the country. When she entered the garden, she had an immediate feeling of having been there before. This feeling was repeated when she went into the reception rooms, so that she felt she knew in advance what room would be the next one, what view there would be from it, and so on. But the possibility that this feeling of familiarity could have owed its origin to an earlier visit to the house and garden, perhaps one in her earliest childhood, was absolutely ruled out and was disproved as a result of her questioning her parents. The lady who reported this was not in search of any psychological explanation, but saw the occurrence of this feeling as a prophetic indication of the significance for her emotional life which these same school friends later acquired. However, a consideration of the circumstances in which the phenomenon occurred in her shows us the way to another view of the matter. At the time when she paid the visit she knew that these girls had an only brother, who was seriously ill. During the visit she actually set eyes on him, though he looked very ill and she said to herself that he would die soon. Now, her own only brother had been dangerously ill with diphtheria a few months earlier; during his illness she had spent several weeks away from her parents' house, staying with a relative. She believed that her brother had been with her on this visit to the country; she even thought it had been his first considerable journey after his illness; but her memory was remarkably uncertain on these points while of all the other details, and in particular of the dress she was wearing that day, she had an ultra-clear picture. Anyone who is well-informed will find no difficulty in concluding from these hints that the expectation that her brother would die had at that time played an important part in the girl's thoughts and either had never become conscious or, after the favourable termination of the illness, had succumbed to energetic repression. If things had turned out otherwise, she would have had to wear a different dress - mourning. She found an analogous situation in the home of her friends, whose only brother was in danger of dying soon, as in fact he did shortly after. She ought to have remembered consciously that she herself had lived through this situation a few months before: instead of remembering it - which was prevented by repression - she transferred her feeling of remembering something to her surroundings, the garden and the house, and fell a victim to the '*fausse reconnaissance*' of having seen all this exactly the same once before. From the fact that repression occurred we may conclude that her former expectation of her brother's death had not been far removed from a wishful phantasy. She would then have been the only child. In her later neurosis she suffered most severely from a fear of losing her parents, behind which, as usual, analysis was able to reveal the unconscious wish with the same content.

I have been able in a similar way to derive my own fleeting experiences of 'déjà vu' from the emotional constellation of the moment. 'This would once more be an occasion for wakening the (unconscious and unknown) phantasy which was formed in me at this or that time as a wish to improve the situation.' - This explanation of 'déjà vu' has so far been taken into consideration by only one observer. Dr. Ferenczi, to whom the third edition of this book is indebted for so many valuable contributions, writes to me on this subject as follows: "From my own case, as well as that of others, I have convinced myself that the unaccountable feeling of familiarity is to be traced to unconscious phantasies of which one is unconsciously reminded in a situation of the present time. With one of my patients what happened was apparently something different, but in reality it was quite analogous. This feeling returned to him very often, but it regularly proved to have originated from a *forgotten (repressed) portion of a dream of the preceding night*. It seems therefore that "déjà vu" can derive not only from day-dreams but from night-dreams as well.'

I have later learnt that Grasset (1904) has given an explanation of the phenomenon which comes very close to my own.

In 1913 I wrote a short paper describing another phenomenon that is very similar to '*déjà vu*'. This is '*déjà raconté*', the illusion of having already reported something of special interest when it comes up in the course of psycho-analytic treatment. On these occasions the patient maintains with every sign of subjective certainty that he has already recounted a particular memory a long time ago. The physician is however sure of the contrary and is as a rule able to convince the patient of his error. The explanation of this interesting parapraxis is probably that the patient has felt an urge to communicate this information and intended to do so, but has failed to carry it into effect, and that he now takes the memory of the former as a substitute for the latter, the carrying out of his intention.

A similar state of affairs, and probably also the same mechanism, is to be seen in what Ferenczi (1915) has called 'supposed' parapraxes. We believe there is something - some object - that we have forgotten or mislaid or lost; but we are able to convince ourselves we have done nothing of the kind and that everything is as it should be. For example, a woman patient returns to the doctor's room, giving as a reason that she wants to collect the umbrella she has left behind there; but the doctor sees that she is in fact holding it in her hand. There was therefore an impulse towards this parapraxis, and the impulse was sufficient to serve as a substitute for its actual execution. Except for this difference, the supposed parapraxis is equivalent to the real one. It is, however, what one might call cheaper.

(E) When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on [page 1194](#) ('Across Europe in a Tub') gave me the opportunity of showing how a symptom that is at first insoluble becomes accessible to analysis when the *real interest* in the repressed thoughts has passed away.¹ As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

¹ [Footnote added 1924:] At this point very interesting problems of an *economic* nature come in, questions taking into consideration the fact that the psychical processes aim at gaining pleasure and removing unpleasure. There is already an economic problem in how it becomes possible by way of substitutive associations to recapture a name that has been forgotten through motives of unpleasure. An excellent paper by Tausk (1913) gives good examples of how the forgotten name becomes accessible once more if one succeeds in connecting it with a pleasurable-toned association, which can counterbalance the unpleasure to be expected from the reproduction of the name.

On the other hand we must not overlook the fact that repressed thoughts and impulses certainly do not achieve expression in symptomatic acts and parapraxes by their own unaided efforts. The technical possibility for such side-slipping on the part of the innervations must be presented independently; this will then be readily exploited by the intention of the repressed to make itself felt consciously. In the case of verbal parapraxes, detailed investigations by philosophers and philologists have endeavoured to determine what are the structural and functional relations that put themselves at the service of such an intention. If we distinguish, among the determinants of parapraxes and symptomatic acts, between the unconscious motive on the one hand and the physiological and psycho-physical relations that come to meet it on the other, it remains an open question whether there are, within the range of normality, yet other factors that can - like the unconscious motive, and in place of it - create parapraxes and symptomatic acts along the lines of these relations. It is not my task to answer this question.

Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that *some* disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

(F) Since our discussion of slips of the tongue we have been content with demonstrating that parapraxes have a hidden motivation, and by the help of psycho-analysis we have traced our way to a knowledge of this motivation. We have so far left almost without consideration the general nature and the peculiarities of the psychical factors that find expression in parapraxes; at any rate we have not yet attempted to define them more closely and to test whether they conform to laws. Nor shall we attempt now to deal with the matter in a radical way, since the subject can better be explored from another angle, as our first steps will show us in a moment.¹ Here several questions can be raised which I will at least bring forward and describe in outline. (1) What is the content and origin of the thoughts and impulses which are indicated in erroneous and chance actions? (2) What are the determinants which compel a thought or an impulse to make use of such actions as a means of expression and which put it in a position to do so? (3) Is it possible to establish constant and unambiguous relations between the kind of parapraxis and the qualities of what is expressed by means of it?

I will begin by bringing together some material for answering the last question. In discussing the examples of slips of the tongue we found it necessary to go beyond the content of what was intended to be said, and were obliged to look for the cause of the speech-disturbance in something outside the intention. What this was was obvious in a number of cases, and was known to the speaker's consciousness. In the examples that seemed simplest and most transparent it was another version of the same thought - one which sounded as if it had an equal right, and which disturbed the expression of the thought without its being possible to explain why the one version had succumbed and the other had won the day. (These are Meringer and Mayer's 'contaminations'.) In a second group of cases the motive for the defeat of one version was a consideration which, however, did not prove strong enough to withhold it completely ('*zum Vorschwein gekommen*'). The version which was withheld was perfectly conscious too. Only of the third group can it be asserted unreservedly that the disturbing thought differed from the one intended, and only in their case can a distinction which is apparently essential be established. The disturbing thought is either connected with the disturbed thought by thought associations (disturbance as a result of internal contradiction), or it is unrelated to it in its nature and the disturbed word happens to be connected with the disturbing thought - which is *often* unconscious - by an unexpected *external* association. In the examples I have given from my psycho-analyses the entire speech is under the influence of thoughts which have become active but have at the same time remained entirely unconscious; either these are betrayed by the disturbance itself ('*Klapperschlange*' - '*Kleopatra*') or they exercise an indirect influence by making it possible for the different parts of the consciously intended speech to disturb each other ('*Ase natmen*', where '*Hasenauer Street*' and reminiscences of a Frenchwoman are in the background). The withheld or unconscious thoughts from which the disturbance in speech derives are of the most varied origin. This survey therefore does not enable us to generalize in any direction.

¹ [Footnote added 1924:] This book is of an entirely popular character; it merely aims, by an accumulation of examples, at paving the way for the necessary assumption of *unconscious yet operative* mental processes, and it avoids all theoretical considerations on the nature of this unconscious.

A comparative examination of my examples of misreading and slips of the pen leads to the same conclusions. As with slips of the tongue, certain cases appear to owe their origin to a work of condensation which has no further motivation (e.g. the '*Apfe*'). It would however be satisfactory to learn whether special conditions may not have to be fulfilled if such a condensation, which is normal in dream-work but a fault in our waking thought, is to take place. No information on this problem can be obtained from the examples themselves. I should however refuse to conclude from this that there are in fact no conditions other than, for instance, a relaxation of conscious attention, since I know from other sources that it is precisely automatic activities which are characterized by correctness and reliability. I should prefer to stress the fact that here, as so often in biology, normal circumstances or those approaching the normal are less favourable subjects for investigation than pathological ones. I expect that what remains obscure in the elucidation of these very slight disturbances will be illuminated by the explanation of serious disturbances.

In misreading and slips of the pen there are also plenty of examples in which we can discern a more remote and complicated motivation. 'Across Europe in a Tub' is a disturbance in reading which is explained as being due to the influence of a remote thought, foreign in its essence, arising from a repressed impulse of jealousy and ambition, and utilizing the 'switch-word' '*Beförderung*' to form a connection with the indifferent and innocent topic that was being read. In the case of 'Burckhard' the name itself forms a 'switch-word' of this kind.

There is no doubt that disturbances in the functions of speech occur more readily, and make smaller demands on the disturbing forces, than do those in other psychical activities.

One is on different ground when it comes to examining forgetting in its proper sense - that is, the forgetting of past experiences. (To distinguish them from forgetting in the stricter sense, we might speak of the forgetting of proper names and of foreign words, described in Chapter I and II, as 'slipping the memory', and the forgetting of intentions as 'omissions'.) The basic determinants of the *normal* process of forgetting are unknown.¹ We are also reminded that not everything is forgotten that we believe to be. Our explanation has here to do only with cases where the forgetting causes us surprise, in so far as it breaks the rule that unimportant things are forgotten but important ones are preserved by memory. Analysis of the examples of forgetting that seem to require a special explanation reveals that the motive for forgetting is invariably an unwillingness to remember something which can evoke distressing feelings. We come to suspect that this motive aims at manifesting itself quite generally in mental life, but is prevented from putting itself into effect at all regularly by other forces which work against it. The extent and the significance of this unwillingness to remember distressing impressions would seem to deserve the most careful psychological examination; moreover we cannot separate from this wider context the question of what special conditions make this forgetting, that is universally aimed at, possible in individual cases.

¹ [Footnote added 1907:] I may perhaps put forward the following suggestions as regards the mechanism of forgetting in its proper sense. Mnemic material is subject in general to two influences, condensation and distortion. Distortion is the work of the dominant trends in mental life, and is directed above all against the memory traces which have remained affectively operative and which show considerable resistance to condensation. The traces that have grown indifferent succumb unresistingly to the process of condensation; yet it can be observed that in addition to this, the distorting trends feed on the indifferent material if they have remained unsatisfied at the place at which they sought to manifest themselves. As these processes of condensation and distortion continue for long periods, during which every fresh experience acts in the direction of transforming the mnemic content, it is generally thought that it is time which makes memory uncertain and indistinct. It is highly probable that there is no question at all of there being any direct function of time in forgetting. - In the case of *repressed* memory-traces it can be demonstrated that they undergo no alteration even in the course of the longest period of time. The unconscious is quite timeless. The most important as well as the strangest characteristic of psychical fixation is that all impressions are preserved, not only in the same form in which they were first received, but also in all the forms which they have adopted in their further developments. This is a state of affairs which cannot be illustrated by comparison with another sphere. Theoretically every earlier state of the mnemic content could thus be restored to memory again, even if its elements have long ago exchanged all their original connections for more recent ones.

In the forgetting of intentions another factor comes into the foreground. The conflict, which could only be *surmised* in the repression of what was distressing to remember, here becomes tangible, and in the analysis of the examples a counter-will can regularly be recognized which opposes the intention without putting an end to it. As in the parapraxes already described, two types of psychical process can be recognized here. Either the counter-will is turned directly against the intention (in cases where the latter's purpose is of some importance), or it is unrelated in its nature to the intention itself and establishes its connection with it by means of an *external* association (in the case of intentions that are almost indifferent).

The same conflict governs the phenomena of bungled actions. The impulsion which manifests itself in disturbing the action is often a counter-impulsion, but still more often it is an entirely unrelated one, which merely takes the opportunity of achieving expression by disturbing the action while it is being carried out. The cases where the disturbance results from an internal contradiction are the more significant ones; they also involve the more important actions.

In chance actions or in symptomatic actions the internal conflict becomes less and less important. These motor manifestations, to which consciousness attaches little value, or which it overlooks entirely, thus serve to express a wide variety of unconscious or withheld impulses; for the most part they are symbolic representations of phantasies or wishes.

In regard to the first question - as to what is the origin of the thoughts and impulses which find expression in parapraxes - we can say that in a number of cases it is easy to show that the disturbing thoughts are derived from suppressed impulses in mental life. In healthy people, egoistic, jealous and hostile feelings and impulsions, on which the pressure of moral education weighs heavily, make frequent use of the pathway provided by parapraxes in order to find some expression for their strength, which undeniably exists but is not recognized by higher mental agencies. Acquiescence in these parapraxes and chance actions is to a large extent equivalent to a compliant tolerance of the immoral. Among these suppressed impulses no small part is played by the various sexual currents. That these particular ones should in fact appear so rarely among the thoughts disclosed by analysis in my examples is an accident of my material. Since the examples I have analysed are to a great extent taken from my own mental life, the selection was partial from the first and aimed at excluding sexual matters. At other times it appears to be from perfectly innocent objections and considerations that the disturbing thoughts arise.

We have now reached the moment for answering the second question - that is, what psychological determinants are responsible for a thought being compelled to seek expression not in its complete form but in a kind of parasitic form, as a modification and disturbance of another thought. The most striking examples of parapraxes make it seem probable that these determinants must be looked for in a relation to admissibility to consciousness: in the question, that is, of the greater or less degree to which they bear the marked character of being 'repressed'. But if we follow this character through the series of examples, it dissolves into ever vaguer indications. The inclination to dismiss something as a waste of time, or the consideration that the thought in question is not properly relevant to the matter in hand, appear, as motives for pushing back a thought (which is then left to find expression by disturbing another thought), to play the same part as does the moral condemnation of an insubordinate emotional impulse or as does derivation from totally unconscious trains of thought. Insight into the general nature of how parapraxes and chance actions are determined cannot be gained along these lines. One single fact of significance emerges from these enquiries. The more innocent the motivation of a parapraxis, and the less objectionable - and therefore the less inadmissible to consciousness - the thought finding expression in it, the easier it is to explain the phenomenon, once one's attention has been turned to it. The slightest cases of slips of the tongue are noticed immediately, and spontaneously corrected. Where the motivation comes from really repressed impulses, the case has to be elucidated by careful analysis, which may itself at times come up against difficulties or prove unsuccessful.

We are therefore no doubt justified in taking the result of this last enquiry as evidence that the satisfactory explanation of the psychological determinants of parapraxes and chance actions is to be looked for along other lines and by a different approach. The indulgent reader may accordingly see in these discussions signs of the broken edges where this subject has been somewhat artificially detached from a wider context.

(G) A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the 'dream-work' in my *Interpretation of Dreams*. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases *the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions*.

An important conclusion can be drawn from this conformity. The peculiar mode of working, whose most striking achievement we see in the content of dreams, cannot be attributed to the sleeping state of mental life if we possess such abundant evidence in the form of parapraxes that it operates during our waking life as well. The same connection also forbids our assuming that these psychical processes, which strike us as abnormal and strange, are determined by a deep-seated decay in mental activity or by pathological states of functioning.¹

¹ See *The Interpretation of Dreams* (1900a), p. 1034-5.

We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting-point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements - namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic - acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at - *formes frustres*¹ - of the neuroses: cases in which the symptoms are few, or occur rarely or not severely - in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way - that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life - this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.

But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: *the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.*

FRAGMENT OF AN ANALYSIS OF A CASE OF HYSTERIA
(1905 [1901])

Intentionally left blank

FRAGMENT OF AN ANALYSIS OF A CASE OF HYSTERIA

PREFATORY REMARKS

In 1895 and 1896 I put forward certain views upon the pathogenesis of hysterical symptoms and upon the mental processes occurring in hysteria. Since that time several years have passed. In now proposing, therefore, to substantiate those views by giving a detailed report of the history of a case and its treatment, I cannot avoid making a few introductory remarks, for the purpose partly of justifying from various standpoints the step I am taking, and partly of diminishing the expectations to which it will give rise.

No doubt it was awkward that I was obliged to publish the results of my enquiries without there being any possibility of other workers in the field testing and checking them, particularly as those results were of a surprising and by no means gratifying character. But it will be scarcely less awkward now that I am beginning to bring forward some of the material upon which my conclusions were based and make it accessible to the judgement of the world. I shall not escape blame by this means. Only, whereas before I was accused of giving no information about my patients, now I shall be accused of giving information about my patients which ought not to be given. I can only hope that in both cases the critics will be the same, and that they will merely have shifted the pretext for their reproaches; if so I can resign in advance any possibility of ever removing their objections.

Even if I ignore the ill-will of narrow-minded critics such as these, the presentation of my case histories remains a problem which is hard for me to solve. The difficulties are partly of a technical kind, but are partly due to the nature of the circumstances themselves. If it is true that the causes of hysterical disorders are to be found in the intimacies of the patients' psycho-sexual life, and that hysterical symptoms are the expression of their most secret and repressed wishes, then the complete elucidation of a case of hysteria is bound to involve the revelation of those intimacies and the betrayal of those secrets. It is certain that the patients would never have spoken if it had occurred to them that their admissions might possibly be put to scientific uses; and it is equally certain that to ask them themselves for leave to publish their case would be quite unavailing. In such circumstances persons of delicacy, as well as those who were merely timid, would give first place to the duty of medical discretion and would declare with regret that the matter was one upon which they could offer science no enlightenment. But in my opinion the physician has taken upon himself duties not only towards the individual patient but towards science as well; and his duties towards science mean ultimately nothing else than his duties towards the many other patients who are suffering or will some day suffer from the same disorder. Thus it becomes the physician's duty to publish what he believes he knows of the causes and structure of hysteria, and it becomes a disgraceful piece of cowardice on his part to neglect doing so, as long as he can avoid causing direct personal injury to the single patient concerned. I think I have taken every precaution to prevent my patient from suffering any such injury. I have picked out a person the scenes of whose life were laid not in Vienna but in a remote provincial town, and whose personal circumstances must therefore be practically unknown in Vienna. I have from the very beginning kept the fact of her being under my treatment such a careful secret that only one other physician - and one in whose discretion I have complete confidence - can be aware that the girl was a patient of mine. I have waited for four whole years since the end of the treatment and have postponed publication till hearing that a change has taken place in the patient's life of such a character as allows me to suppose that her own interest in the occurrences and psychological events which are to be related here may now have grown faint. Needless to say, I have allowed no name to stand which could put a non-medical reader upon the scent; and the publication of the case in a purely scientific, and technical periodical should, further, afford a guarantee against unauthorized readers of this sort. I naturally cannot prevent the patient herself from being pained if her own case history should accidentally fall into her hands. But she will learn nothing from it that she does not already know; and she may ask herself who besides her could discover from it that she is the subject of this paper.

I am aware that - in this city, at least - there are many physicians who (revolting though it may seem) choose to read a case history of this kind not as a contribution to the psychopathology of the neuroses, but as a *roman à clef* designed for their private delectation. I can assure readers of this species that every case history which I may have occasion to publish in the future will be secured against their perspicacity by similar guarantees of secrecy, even though this resolution is bound to put quite extraordinary restrictions upon my choice of material.

Now in this case history - the only one which I have hitherto succeeded in forcing through the limitations imposed by medical discretion and unfavourable circumstances - sexual questions will be discussed with all possible frankness, the organs and functions of sexual life will be called by their proper names, and the pure-minded reader can convince himself from my description that I have not hesitated to converse upon such subjects in such language even with a young woman. Am I then, to defend myself upon this score as well? I will simply claim for myself the rights of the gynaecologist - or rather, much more modest ones - and add that it would be the mark of a singular and perverse prurience to suppose that conversations of this kind are a good means of exciting or of gratifying sexual desire. For the rest, I feel inclined to express my opinion on this subject in a few borrowed words:

'It is deplorable to have to make room for protestations and declarations of this sort in a scientific work; but let no one reproach me on this account but rather accuse the spirit of the age, owing to which we have reached a state of things in which no serious book can any longer be sure of survival.' (Schmidt, 1902, Preface.)

I will now describe the way in which I have overcome the *technical* difficulties of drawing up the report of this case history. The difficulties are very considerable when the physician has to conduct six or eight psychotherapeutic treatments of the sort in a day, and cannot make notes during the actual session with the patient for fear of shaking the patient's confidence and of disturbing his own view of the material under observation. Indeed, I have not yet succeeded in solving the problem of how to record for publication the history of a treatment of long duration. As regards the present case, two circumstances have come to my assistance. In the first place the treatment did not last for more than three months; and in the second place the material which elucidated the case was grouped around two dreams (one related in the middle of the treatment and one at the end). The wording of these dreams was recorded immediately after the session, and they thus afforded a secure point of attachment for the chain of interpretations and recollections which proceeded from them. The case history itself was only committed to writing from memory after the treatment was at an end, but while my recollection of the case was still fresh and was heightened by my interest in its publication. Thus the record is not absolutely - phonographically - exact, but it can claim to possess a high degree of trustworthiness. Nothing of any importance has been altered in it except in some places the order in which the explanations are given; and this has been done for the sake of presenting the case in a more connected form.

I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (*The Interpretation of Dreams*) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt at explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

Nevertheless, it would be wrong to suppose that dreams and their interpretation occupy such a prominent position in all psycho-analyses as they do in this example.

While the case history before us seems particularly favoured as regards the utilization of dreams, in other respects it has turned out poorer than I could have wished. But its shortcomings are connected with the very circumstances which have made its publication possible. As I have already said, I should not have known how to deal with the material involved in the history of a treatment which had lasted, perhaps, for a whole year. The present history, which covers only three months could be recollected and reviewed; but its results remain incomplete in more than one respect. The treatment was not carried through to its appointed end, but was broken off at the patient's own wish when it had reached a certain point. At that time some of the problems of the case had not even been attacked and others had only been imperfectly elucidated; whereas, if the work had been continued, we should no doubt have obtained the fullest possible enlightenment upon every particular of the case. In the following pages, therefore, I can present only a fragment of an analysis.

Readers who are familiar with the technique of analysis as it was expounded in the *Studies on Hysteria* will perhaps be surprised that it should not have been possible in three months to find a complete solution at least for those of the symptoms which were taken in hand. This will become intelligible when I explain that since the date of the *Studies* psycho-analytic technique has been completely revolutionized. At that time the work of analysis started out from the symptoms, and aimed at clearing them up one after the other. Since then I have abandoned that technique, because I found it totally inadequate for dealing with the finer structure of a neurosis. I now let the patient himself choose the subject of the day's work, and in that way I start out from whatever surface his unconscious happens to be presenting to his notice at the moment. But on this plan everything that has to do with the clearing-up of a particular symptom emerges piecemeal, woven into various contexts, and distributed over widely separated periods of time. In spite of this apparent disadvantage, the new technique is far superior to the old, and indeed there can be no doubt that it is the only possible one.

In face of the incompleteness of my analytic results, I had no choice but to follow the example of those discoverers whose good fortune it is to bring to the light of day after their long burial the priceless though mutilated relics of antiquity. I have restored what is missing, taking the best models known to me from other analyses; but, like a conscientious archaeologist, have not omitted to mention in each case where the authentic parts end and my constructions begin.

There is another kind of incompleteness which I myself have intentionally introduced. I have as a rule not reproduced the process of interpretation to which the patient's associations and communications had to be subjected, but only the results of that process. Apart from the dreams, therefore, the technique of the analytic work has been revealed in only a very few places. My object in this case history was to demonstrate the intimate structure of a neurotic disorder and the determination of its symptoms; and it would have led to nothing but hopeless confusion if I had tried to complete the other task at the same time. Before the technical rules, most of which have been arrived at empirically, could be properly laid down, it would be necessary to collect material from the histories of a large number of treatments. Nevertheless, the degree of shortening produced by the omission of the technique is not to be exaggerated in this particular case. Precisely that portion of the technical work which is the most difficult never came into question with the patient; for the factor of 'transference', which is considered at the end of the case history, did not come up for discussion during the short treatment.

For a third kind of incompleteness in this report neither the patient nor the author is responsible. It is, on the contrary, obvious that a single case history, even if it were complete and open to no doubt, cannot provide an answer to *all* the questions arising out of the problem of hysteria. It cannot give an insight into all the types of this disorder, into all the forms of internal structure of the neurosis, into all the possible kinds of relation between the mental and the somatic which are to be found in hysteria. It is not fair to expect from a single case more than it can offer. And any one who has hitherto been unwilling to believe that a psychosexual aetiology holds good generally and without exception for hysteria is scarcely likely to be convinced of the fact by taking stock of a single case history. He would do better to suspend his judgement until his own work has earned him the right to a conviction.¹

¹ [*Footnote added 1923:*] The treatment described in this paper was broken off on December 31st, 1899. [1900] My account of it was written during the two weeks immediately following, but was not published until 1905. It is not to be expected that after more than twenty years of uninterrupted work I should see nothing to alter in my view of such a case and in my presentment of it; but it would obviously be absurd to bring the case history 'up to date' by means of emendations and additions. In all essentials, therefore, I have left it as it was, and in the text I have merely corrected a few oversights and inaccuracies to which my excellent English translators, Mr. and Mrs. James Strachey, have directed my attention. Such critical remarks as I have thought it permissible to add I have incorporated in these additional notes: so that the reader will be justified in assuming that I still hold to the opinions expressed in the text unless he finds them contradicted in the footnotes. The problem of medical discretion which I have discussed in this preface does not touch the remaining case histories contained in this volume; for three of them were published with the express assent of the patients (or rather, as regards little Hans, with that of his father), while in the fourth case (that of Schreber) the subject of the analysis was not actually a person but a book produced by him. In Dora's case the secret was kept until this year. I had long been out of touch with her, but a short while ago I heard that she had recently fallen ill again from other causes, and had confided to her physician that she had been analysed by me when she was a girl. This disclosure made it easy for my well-informed colleague to recognize her as the Dora of 1899. No fair judge of analytic therapy will make it a reproach that the three months' treatment she received at that time effected no more than the relief of her current conflict and was unable to give her protection against subsequent illnesses.

I

THE CLINICAL PICTURE

In my *Interpretation of Dreams*, published in 1900, I showed that dreams in general can be interpreted, and that after the work of interpretation has been completed they can be replaced by perfectly correctly constructed thoughts which can be assigned a recognizable position in the chain of mental events. I wish to give an example in the following pages of the only practical application of which the art of interpreting dreams seems to admit. I have already mentioned in my book¹ how it was that I came upon the problem of dreams. The problem crossed my path as I was endeavouring to cure psychoneuroses by means of a particular psychotherapeutic method. For, among their other mental experiences, my patients told me their dreams, and these dreams seemed to call for insertion in the long thread of connections which spun itself out between a symptom of the disease and a pathogenic idea. At that time I learnt how to translate the language of dreams into the forms of expression of our own thought-language, which can be understood without further help. And I may add that this knowledge is essential for the psycho-analyst; for the dream is one of the roads along which consciousness can be reached by the psychical material which, on account of the opposition aroused by its content, has been cut off from consciousness and repressed, and has thus become pathogenic. The dream, in short, is one of the *détours by which repression can be evaded*; it is one of the principal means employed by what is known as the indirect method of representation in the mind. The following fragment from the history of the treatment of a hysterical girl is intended to show the way in which the interpretation of dreams plays a part in the work of analysis. It will at the same time give me a first opportunity of publishing at sufficient length to prevent further misunderstanding some of my views upon the psychical processes of hysteria and upon its organic determinants. I need no longer apologize on the score of length, since it is now agreed that the exacting demands which hysteria makes upon physician and investigator can be met only by the most sympathetic spirit of inquiry and not by an attitude of superiority and contempt. For,

Nicht kunst und Wissenschaft allein,
Geduld will bei dem Werke sein!²

¹ *The Interpretation of Dreams*, Chapter II.

² [Not Art and Science serve, alone;
Patience must in the work be shown.]

If I were to begin by giving a full and consistent case history, it would place the reader in a very different situation from that of the medical observer. The reports of the patient's relatives - in the present case I was given one by the eighteen-year-old girl's father - usually afford a very indistinct picture of the course of the illness. I begin the treatment, indeed, by asking the patient to give me the whole story of his life and illness, but even so the information I receive is never enough to let me see my way about the case. This first account may be compared to an unnavigable river whose stream is at one moment choked by masses of rock and at another divided and lost among shallows and sandbanks. I cannot help wondering how it is that the authorities can produce such smooth and precise histories in cases of hysteria. As a matter of fact the patients are incapable of giving such reports about themselves. They can, indeed, give the physician plenty of coherent information about this or that period of their lives; but it is sure to be followed by another period as to which their communications run dry, leaving gaps unfilled, and riddles unanswered; and then again will come yet another period which will remain totally obscure and unilluminated by even a single piece of serviceable information. The connections - even the ostensible ones - are for the most part incoherent, and the sequence of different events is uncertain. Even during the course of their story patients will repeatedly correct a particular or a date, and then perhaps, after wavering for some time, return to their first version. The patients' inability to give an ordered history of their life in so far as it coincides with the history of their illness is not merely characteristic of the neurosis.¹ It also possesses great theoretical significance. For this inability has the following grounds. In the first place, patients consciously and intentionally keep back part of what they ought to tell - things that are perfectly well known to them - because they have not got over their feelings of timidity and shame (or discretion, where what they say concerns other people); this is the share taken by *conscious* disingenuousness. In the second place, part of the anamnestic knowledge, which the patients have at their disposal at other times, disappears while they are actually telling their story, but without their making any deliberate reservations: the share taken by *unconscious* disingenuousness. In the third place, there are invariably true amnesias - gaps in the memory into which not only old recollections but even quite recent ones have fallen - and paramnesias, formed secondarily so as to fill in those gaps.² When the events themselves have been kept in mind, the purpose underlying the amnesias can be fulfilled just as surely by destroying a connection, and a connection is most surely broken by altering the chronological order of events. The latter always proves to be the most vulnerable element in the store of memory and the one which is most easily subject to repression. Again we meet with many recollections that are in what might be described as the first stage of repression, and these we find surrounded with doubts. At a later period the doubts would be replaced by a loss or a falsification of memory.³

¹ Another physician once sent his sister to me for psychotherapeutic treatment, telling me that she had for years been treated without success for hysteria (pains and defective gait). The short account which he gave me seemed quite consistent with the diagnosis. In my first hour with the patient I got her to tell me her history herself. When the story came out perfectly clearly and connectedly in spite of the remarkable events it dealt with, I told myself that the case could not be one of hysteria, and immediately instituted a careful physical examination. This led to the diagnosis of a not very advanced state of tabes, which was later treated with Hg injections (Ol. cinereum) by Professor Lang with markedly beneficial results.

² Amnesias and paramnesias stand in a complementary relation to each other. When there are large gaps in the memory there will be few mistakes in it. And conversely, paramnesias can at a first glance completely conceal the presence of amnesias.

³ If a patient exhibits doubts in the course of his narrative, an empirical rule teaches us to disregard such expressions of his judgement entirely. If the narrative wavers between two versions, we should incline to regard the first one as correct and the second as a product of repression.

That this state of affairs should exist in regard to the memories relating to the history of the illness is a *necessary correlate of the symptoms and one which is theoretically requisite*. In the further course of the treatment the patient supplies the facts which, though he had known them all along, had been kept back by him or had not occurred to his mind. The paramnesias prove untenable, and the gaps in his memory are filled in. It is only towards the end of the treatment that we have before us all intelligible, consistent, and unbroken case history. Whereas the practical aim of the treatment is to remove all possible symptoms and to replace them by conscious thoughts, we may regard it as a second and theoretical aim to repair all the damages to the patient's memory. These two aims are coincident. When one is reached, so is the other; and the same path leads to them both.

It follows from the nature of the facts which form the material of psycho-analysis that we are obliged to pay as much attention in our case histories to the purely human and social circumstances of our patients as to the somatic data and the symptoms of the disorder. Above all, our interest will be directed towards their family circumstances - and not only, as will be seen later, for the purpose of enquiring into their heredity.

The family circle of the eighteen-year-old girl who is the subject of this paper included, besides herself, her two parents and a brother who was one and a half years her senior. Her father was the dominating figure in this circle, owing to his intelligence and his character as much as to the circumstances of his life. It was those circumstances which provided the framework for the history of the patient's childhood and illness. At the time at which I began the girl's treatment her father was in his late forties, a man of rather unusual activity and talents, a large manufacturer in very comfortable circumstances. His daughter was most tenderly attached to him, and for that reason her critical powers, which developed early, took all the more offence at many of his actions and peculiarities.

Her affection for him was still further increased by the many severe illnesses which he had been through since her sixth year. At that time he had fallen ill with tuberculosis and the family had consequently moved to a small town in a good climate situated in one of our southern provinces. There his lung trouble rapidly improved; but, on account of the precautions which were still considered necessary, both parents and children continued for the next ten years or so to reside chiefly in this spot, which I shall call B--. When her father's health was good, he used at times to be away, on visits to his factories. During the hottest part of the summer the family used to move to a health resort in the hills.

When the girl was about ten years old, her father had to go through a course of treatment in a darkened room on account of a detached retina. As a result of this misfortune his vision was permanently impaired. His gravest illness occurred some two years later. It took the form of a confusional attack, followed by symptoms of paralysis and slight mental disturbances. A friend of his (who plays a part in the story with which we shall be concerned later on) persuaded him, while his condition had scarcely improved, to travel to Vienna with his physician and come to me for advice. I hesitated for some time as to whether I ought not to regard the case as one of tabo-paralysis, but I finally decided upon a diagnosis of a diffuse vascular affection; and since the patient admitted having had a specific infection before his marriage, I prescribed an energetic course of anti-luetic treatment, as a result of which all the remaining disturbances passed off. It is no doubt owing to this fortunate intervention of mine that four years later he brought his daughter, who had meanwhile grown unmistakably neurotic, and introduced her to me, and that after another two years he handed her over to me for psychotherapeutic treatment.

I had in the meantime also made the acquaintance in Vienna of a sister of his, who was a little older than himself. She gave clear evidence of a severe form of psychoneurosis without any characteristically hysterical symptoms. After a life which had been weighed down by an unhappy marriage, she died of a marasmus which made rapid advances and the symptoms of which were, as a matter of fact, never fully cleared up. An elder brother of the girl's father, whom I once happened to meet, was a hypochondriacal bachelor.

The sympathies of the girl herself, who, as I have said, became my patient at the age of eighteen, had always been with the father's side of the family, and ever since she had fallen ill she had taken as her model the aunt who has just been mentioned. There could be no doubt, too, that it was from her father's family that she had derived not only her natural gifts and her intellectual precocity but also the predisposition to her illness. I never made her mother's acquaintance. From the accounts given me by the girl and her father I was led to imagine her as an uncultivated woman and above all as a foolish one, who had concentrated all her interests upon domestic affairs, especially since her husband's illness and the estrangement to which it led. She presented the picture, in fact, of what might be called the 'housewife's psychosis'. She had no understanding of her children's more active interests, and was occupied all day long in cleaning the house with its furniture and utensils and in keeping them clean - to such an extent as to make it almost impossible to use or enjoy them. This condition, traces of which are to be found often enough in normal housewives, inevitably reminds one of forms of obsessional washing and other kinds of obsessional cleanliness. But such women (and this applied to the patient's mother) are entirely without insight into their illness, so that one essential characteristic of an 'obsessional neurosis' is lacking. The relations between the girl and her mother had been unfriendly for years. The daughter looked down on her mother and used to criticize her mercilessly, and she had withdrawn completely from her influence.¹

¹ I do not, it is true, adopt the position that heredity is the only aetiological factor in hysteria. But, on the other hand - and I say this with particular reference to some of my earlier publications, e.g. 'Heredity and the Aetiology of the Neuroses' (1896*n*), in which I combated that view - I do not wish to give an impression of underestimating the importance of heredity in the aetiology of hysteria or of asserting that it can be dispensed with. In the case of the present patient the information I have given about her father and his brother and sister indicates a sufficiently heavy taint; and, indeed, if the view is taken that pathological conditions such as her mother's must also imply a hereditary predisposition, the patient's heredity may be regarded as a convergent one. To my mind, however, there is another factor which is of more significance in the girl's hereditary or, properly speaking, constitutional predisposition. I have mentioned that her father had contracted syphilis before his marriage. Now a *strikingly high* percentage of the patients whom I have treated psycho-analytically come of fathers who have suffered from tabes or general paralysis. In consequence of the novelty of my therapeutic method, I see only the *severest* cases, which have already been under treatment for years without any success. In accordance with the Erb-Fournier theory, tabes or general paralysis in the male parent may be regarded as evidence of an earlier luetic infection; and indeed I was able to obtain direct confirmation of such an infection in a number of cases. In the most recent discussion on the offspring of syphilitic parents (Thirteenth International Medical Congress, held in Paris, August 2nd to 9th, 1900: papers by Finger, Tarnowsky, Jullien, etc.), I find no mention of the conclusion to which I have been driven by my experience as a neuropathologist - namely, that syphilis in the male parent is a very relevant factor in the aetiology of the neuropathic constitution of children.

During the girl's earlier years, her only brother (her elder by a year and a half) had been the model which her ambitions had striven to follow. But in the last few years the relations between the brother and sister had grown more distant. The young man used to try so far as he could to keep out of the family disputes; but when he was obliged to take sides he would support his mother. So that the usual sexual attraction had drawn together the father and daughter on the one side and the mother and son on the other.

The patient, to whom I shall in future give the name of 'Dora', had even at the age of eight begun to develop neurotic symptoms. She became subject at that time to chronic dyspnoea with occasional accesses in which the symptom was very much aggravated. The first onset occurred after a short expedition in the mountains and was accordingly put down to over-exertion. In the course of six months, during which she was made to rest and was carefully looked after, this condition gradually passed off. The family doctor seems to have had not a moment's hesitation in diagnosing the disorder as purely nervous and in excluding any organic cause for the dyspnoea; but he evidently considered this diagnosis compatible with the aetiology of over-exertion.¹

The little girl went through the usual infectious diseases of childhood without suffering any lasting damage. As she herself told me - and her words were intended to convey a deeper meaning - her brother was as a rule the first to start the illness and used to have it very slightly, and she would then follow suit with a severe form of it. When she was about twelve she began to suffer from unilateral headaches in the nature of a migraine, and from attacks of nervous coughing. At first these two symptoms always appeared together, but they became separated later on and ran different courses. The migraine grew rarer, and by the time she was sixteen she had quite got over it. But attacks of *tussis nervosa*, which had no doubt been started by a common catarrh, continued to occur over the whole period. When, at the age of eighteen, she came to me for treatment, she was again coughing in a characteristic manner. The number of these attacks could not be determined; but they lasted from three to five weeks, and on one occasion for several months. The most troublesome symptom during the first half of an attack of this kind, at all events in the last few years, used to be a complete loss of voice. The diagnosis that this was once more a nervous complaint had been established long since; but the various methods of treatment which are usual, including hydrotherapy and the local application of electricity, had produced no result. It was in such circumstances as these that the child had developed into a mature young woman of very independent judgement, who had grown accustomed to laugh at the efforts of doctors, and in the end to renounce their help entirely. Moreover, she had always been against calling in medical advice, though she had no personal objection to her family doctor. Every proposal to consult a new physician aroused her resistance, and it was only her father's authority which induced her to come to me at all.

I first saw her when she was sixteen, in the early summer. She was suffering from a cough and from hoarseness, and even at that time I proposed giving her psychological treatment. My proposal was not adopted, since the attack in question, like the others, passed off spontaneously, though it had lasted unusually long. During the next winter she came and stayed in Vienna with her uncle and his daughters after the death of the aunt of whom she had been so fond. There she fell ill of a feverish disorder which was diagnosed at the time as appendicitis.² In the following autumn, since her father's health seemed to justify the step, the family left the health-resort of B--- for good and all. They first moved to the town where her father's factory was situated, and then, scarcely a year later, settled permanently in Vienna.

¹ The probable precipitating cause of this first illness will be discussed later on.

² On this point see the analysis of the second dream.

Dora was by that time in the first bloom of youth - a girl of intelligent and engaging looks. But she was a source of heavy trials for her parents. Low spirits and an alteration in her character had now become the main features of her illness. She was clearly satisfied neither with herself nor with her family; her attitude towards her father was unfriendly, and she was on very bad terms with her mother, who was bent upon drawing her into taking a share in the work of the house. She tried to avoid social intercourse, and employed herself - so far as she was allowed to by the fatigue and lack of concentration of which she complained - with attending lectures for women and with carrying on more or less serious studies. One day her parents were thrown into a state of great alarm by finding on the girl's writing-desk, or inside it, a letter in which she took leave of them because, as she said, she could no longer endure her life.¹ Her father, indeed, being a man of some perspicacity, guessed that the girl had no serious suicidal intentions. But he was none the less very much shaken; and when one day, after a slight passage of words between him and his daughter, she had a first attack of loss of consciousness² - an event which was subsequently covered by an amnesia - it was determined, in spite of her reluctance, that she should come to me for treatment.

¹ As I have already explained, the treatment of the case, and consequently my insight into the complex of events composing it, remained fragmentary. There are therefore many questions to which I have no solution to offer, or in which I can only rely upon hints and conjectures. This affair of the letter came up in the course of one of our sessions, and the girl showed signs of astonishment. 'How on earth', he asked, 'did they find the letter? It was shut up in my desk.' But since she knew that her parents had read this draft of a farewell letter, I conclude that she had herself arranged for it to fall into their hands.

² The attack was, I believe, accompanied by convulsions and delirious states. But since this event was not reached by the analysis either, I have no trustworthy recollections on the subject to fall back upon.

No doubt this case history, as I have so far outlined it, does not upon the whole seem worth recording. It is merely a case of '*petite hystérie*' with the commonest of all somatic and mental symptoms: dyspnoea, *tussis nervosa*, aponia, and possibly migraines, together with depression, hysterical unsociability, and a *taedium vitae* which was probably not entirely genuine. More interesting cases of hysteria have no doubt been published, and they have very often been more carefully described; for nothing will be found in the following pages on the subject of stigmata of cutaneous sensibility, limitation of the visual field, or similar matters. I may venture to remark, however, that all such collections of the strange and wonderful phenomena of hysteria have but slightly advanced our knowledge of a disease which still remains as great a puzzle as ever. What is wanted is precisely an elucidation of the *commonest* cases and of their most frequent and typical symptoms. I should have been very well satisfied if the circumstances had allowed me to give a complete elucidation of this case of *petite hystérie*. And my experiences with other patients leave me in no doubt that my analytic method would have enabled me to do so.

In 1896, shortly after the appearance of my *Studies on Hysteria* (written in conjunction with Dr. J. Breuer, 1895), I asked an eminent fellow-specialist for his opinion on the psychological theory of hysteria put forward in that work. He bluntly replied that he considered it an unjustifiable generalization of conclusions which might hold good for a few cases. Since then I have seen an abundance of cases of hysteria, and I have been occupied with each case for a number of days, weeks, or years. In not a single one of them have I failed to discover the psychological determinants which were postulated in the *Studies*, namely, a psychical trauma, a conflict of affects, and an additional factor which I brought forward in later publications - a disturbance in the sphere of sexuality. It is of course not to be expected that the patient will come to meet the physician half-way with material which has become pathogenic for the very reason of its efforts to lie concealed; nor must the enquirer rest content with the first 'No' that crosses his path.¹

¹ Here is an instance of this. Another physician in Vienna, whose conviction of the unimportance of sexual factors in hysteria has probably been very much strengthened by such experiences as this, was consulted in the case of a fourteen-year-old girl who suffered from dangerous hysterical vomiting. He made up his mind to ask her the painful question whether by any chance she had ever had a love-affair with a man. 'No!' answered the child, no doubt with well-affected astonishment; and then repeated to her mother in her irreverent way: 'Only fancy! the old stupid asked me if I was in love!' She afterwards came to me for treatment, and proved - though not during our very first conversation, to be sure - to have been a masturbator for many years, with a considerable leucorrhoeal discharge (which had a close bearing on her vomiting). She had finally broken herself of the habit, but was tormented in her abstinence by the most acute sense of guilt, so that she looked upon every misfortune that befell her family as a divine punishment for her transgression. Besides this, she was under the influence of the romance of an unmarried aunt, whose pregnancy (a second determinant for her vomiting) was supposed to have been happily hidden from her. The girl was looked upon as a 'mere child,' but she turned out to be initiated into all the essentials of sexual relations.

In Dora's case, thanks to her father's shrewdness which I have remarked upon more than once already, there was no need for me to look about for the points of contact between the circumstances of the patient's life and her illness, at all events in its most recent form. Her father told me that he and his family while they were at B-- had formed an intimate friendship with a married couple who had been settled there for several years. Frau K. had nursed him during his long illness, and had in that way, he said, earned a title to his undying gratitude. Herr K. had always been most kind to Dora. He had gone walks with her when he was there, and had made her small presents; but no one had thought any harm of that. Dora had taken the greatest care of the K.'s two little children, and been almost a mother to them. When Dora and her father had come to see me two years before in the summer, they had been just on their way to stop with Herr and Frau K., who were spending the summer on one of our lakes in the Alps. Dora was to have spent several weeks at the K.'s, while her father had intended to return home after a few days. During that time Herr K. had been staying there as well. As her father was preparing for his departure the girl had suddenly declared with the greatest determination that she was going with him, and she had in fact put her decision into effect. It was not until some days later that she had thrown any light upon her strange behaviour. She had then told her mother - intending that what she said should be passed on to her father - that Herr K. had had the audacity to make her a proposal while they were on a walk after a trip upon the lake. Herr K. had been called to account by her father and uncle on the next occasion of their meeting, but he had denied in the most emphatic terms having on his side made any advances which could have been open to such a construction. He had then proceeded to throw suspicion upon the girl, saying that he had heard from Frau K. that she took no interest in anything but sexual matters, and that she used to read Mantegazza's *Physiology of Love* and books of that sort in their house on the lake. It was most likely, he had added, that she had been over-excited by such reading and had merely 'fancied' the whole scene she had described.

‘I have no doubt’, continued her father, ‘that this incident is responsible for Dora’s depression and irritability and suicidal ideas. She keeps pressing me to break off relations with Herr K. and more particularly with Frau K., whom she used positively to worship formerly. But that I cannot do. For, to begin with, I myself believe that Dora’s tale of the man’s immoral suggestions is a phantasy that has forced its way into her mind; and besides, I am bound to Frau K. by ties of honourable friendship and I do not wish to cause her pain. The poor woman is most unhappy with her husband, of whom, by the way, I have no very high opinion. She herself has suffered a great deal with her nerves, and I am her only support. With my state of health I need scarcely assure you that there is nothing wrong in our relations. We are just two poor wretches who give one another what comfort we can by an exchange of friendly sympathy. You know already that I get nothing out of my own wife. But Dora, who inherits my obstinacy, cannot be moved from her hatred of the K.’s. She had her last attack after a conversation in which she had again pressed me to break with them. Please try and bring her to reason.’

Her father’s words did not always quite tally with this pronouncement; for on other occasions he tried to put the chief blame for Dora’s impossible behaviour on her mother whose peculiarities made the house unbearable for every one. But I had resolved from the first to suspend my judgement of the true state of affairs till I had heard the other side as well.

The experience with Herr K. - his making love to her and the insult to her honour which was involved - seems to provide in Dora's case the psychological trauma which Breuer and I declared long ago to be the indispensable prerequisite for the production of a hysterical disorder. But this new case also presents all the difficulties which have since led me to go beyond that theory,¹ besides an additional difficulty of a special kind. For, as so often happens in histories of cases of hysteria, the trauma that we know of as having occurred in the patient's past life is insufficient to explain or to determine the *particular character* of the symptoms; we should understand just as much or just as little of the whole business if the result of the trauma had been symptoms quite other than *tussis nervosa*, aphonia, depression, and *taedium vitae*. But there is the further consideration that some of these symptoms (the cough and the loss of voice) had been produced by the patient years before the time of the trauma, and that their earliest appearances belong to her childhood, since they occurred in her eighth year. If, therefore, the trauma theory is not to be abandoned, we must go back to her childhood and look about there for any influences or impressions which might have had an effect analogous to that of a trauma. Moreover, it deserves to be remarked that in the investigation even of cases in which the first symptoms had not already set in childhood I have been driven to trace back the patients' life history to their earliest years.²

¹ I have gone beyond that theory, but I have not abandoned it; that is to say, I do not to-day consider the theory incorrect, but incomplete. All that I have abandoned is the emphasis laid upon the so-called 'hypnotic state', which was supposed to be occasioned in the patient by the trauma, and to be the foundation for all the psychologically abnormal events which followed. If, where a piece of joint work is in question, it is legitimate to make a subsequent division of property, I should like to take this opportunity of stating that the hypothesis of 'hypnotic states' - which many reviewers were inclined to regard as the central portion of our work - sprang entirely from the initiative of Breuer. I regard the use of such a term as superfluous and misleading, because it interrupts the continuity of the problem as to the nature of the psychological process accompanying the formation of hysterical symptoms.

² Cf. my paper on 'The Aetiology of Hysteria' (1896c).

When the first difficulties of the treatment had been overcome, Dora told me of an earlier episode with Herr K., which was even better calculated to act as a sexual trauma. She was fourteen years old at the time. Herr K. had made an arrangement with her and his wife that they should meet him one afternoon at his place of business in the principal square of B-- so as to have a view of a church festival. He persuaded his wife, however, to stay at home, and sent away his clerks, so that he was alone when the girl arrived. When the time for the procession approached, he asked the girl to wait for him at the door which opened on to the staircase leading to the upper story, while he pulled down the outside shutters. He then came back, and, instead of going out by the open door, suddenly clasped the girl to him and pressed a kiss upon her lips. This was surely just the situation to call up a distinct feeling of sexual excitement in a girl of fourteen who had never before been approached. But Dora had at that moment a violent feeling of disgust, tore herself free from the man, and hurried past him to the staircase and from there to the street door. She nevertheless continued to meet Herr K. Neither of them ever mentioned the little scene; and according to her account Dora kept it a secret till her confession during the treatment. For some time afterwards, however, she avoided being alone with Herr K. The K.'s had just made plans for an expedition which was to last for some days and on which Dora was to have accompanied them. After the scene of the kiss she refused to join the party, without giving any reason.

In this scene - second in order of mention, but first in order of time - the behaviour of this child of fourteen was already entirely and completely hysterical. I should without question consider a person hysterical in whom an occasion for sexual excitement elicited feelings that were preponderantly or exclusively unpleasurable; and I should do so whether or no the person were capable of producing somatic symptoms. The elucidation of the mechanism of this *reversal of affect* is one of the most important and at the same time one of the most difficult problems in the psychology of the neuroses. In my own judgement I am still some way from having achieved this end; and I may add that within the limits of the present paper I shall be able to bring forward only a part of such knowledge on the subject as I do possess.

In order to particularize Dora's case it is not enough merely to draw attention to the reversal of affect; there has also been a *displacement* of sensation. Instead of the genital sensation which would certainly have been felt by a healthy girl in such circumstances,¹ Dora was overcome by the unpleasurable feeling which is proper to the tract of mucous membrane at the entrance to the alimentary canal - that is by disgust. The stimulation of her lips by the kiss was no doubt of importance in localizing the feeling at that particular place; but I think I can also recognize another factor in operation.²

The disgust which Dora felt on that occasion did not become a permanent symptom, and even at the time of the treatment it was only, as it were, potentially present. She was a poor eater and confessed to some disinclination for food. On the other hand, the scene had left another consequence behind it in the shape of a sensory hallucination which occurred from time to time and even made its appearance while she was telling me her story. She declared that she could still feel upon the upper part of her body the pressure of Herr K.'s embrace. In accordance with certain rules of symptom-formation which I have come to know, and at the same time taking into account certain other of the patient's peculiarities, which were otherwise inexplicable, - such as her unwillingness to walk past any man whom she saw engaged in eager or affectionate conversation with a lady, - I have formed in my own mind the following reconstruction of the scene. I believe that during the man's passionate embrace she felt not merely his kiss upon her lips but also the pressure of his erect member against her body. This perception was revolting to her; it was dismissed from her memory, repressed, and replaced by the innocent sensation of pressure upon her thorax, which in turn derived an excessive intensity from its repressed source. Once more, therefore, we find a displacement from the lower part of the body to the upper.³ On the other hand, the compulsive piece of behaviour which I have mentioned was formed as though it were derived from the undistorted recollection of the scene: she did not like walking past any man who she thought was in a state of sexual excitement, because she wanted to avoid seeing for a second time the somatic sign which accompanies it.

¹ Our appreciation of these circumstances will be facilitated when more light has been thrown upon them.

² The causes of Dora's disgust at the kiss were certainly not adventitious, for in that case she could not have failed to remember and mention them. I happen to know Herr K., for he was the same person who had visited me with the patient's father, and he was still quite young and of prepossessing appearance.

³ The occurrence of displacements of this kind has not been assumed for the purpose of this single explanation; the assumption has proved indispensable for the explanation of a large class of symptoms. Since treating Dora I have come across another instance of an embrace (this time without a kiss) causing a fright. It was a case of a young woman who had previously been devotedly fond of the man she was engaged to, but had suddenly begun to feel a coldness towards him, accompanied by severe depression, and on that account came to me for treatment. There was no difficulty in tracing the fright back to an erection on the man's part, which she had perceived but had dismissed from her consciousness.

It is worth remarking that we have here three symptoms - the disgust, the sensation of pressure on the upper part of the body, and the avoidance of men engaged in affectionate conversation - all of them derived from a single experience, and that it is only by taking into account the interrelation of these three phenomena that we can understand the way in which the formation of the symptoms came about. The disgust is the symptom of repression in the erotogenic oral zone, which, as we shall hear, had been over-indulged in Dora's infancy by the habit of sensual sucking. The pressure of the erect member probably led to an analogous change in the corresponding female organ, the clitoris; and the excitation of this second erotogenic zone was referred by a process of displacement to the simultaneous pressure against the thorax and became fixed there. Her avoidance of men who might possibly be in a state of sexual excitement follows the mechanism of a phobia, its purpose being to safeguard her against any revival of the repressed perception.

In order to show that such a supplement to the story was possible, I questioned the patient very cautiously as to whether she knew anything of the physical signs of excitement in a man's body. Her answer, as touching the present, was 'Yes', but, as touching the time of the episode, 'I think not'. From the very beginning I took the greatest pains with this patient not to introduce her to any fresh facts in the region of sexual knowledge; and I did this, not from any conscientious motives, but because I was anxious to subject my assumptions to a rigorous test in this case. Accordingly, I did not call a thing by its name until her allusions to it had become so unambiguous that there seemed very slight risk in translating them into direct speech. Her answer was always prompt and frank: she knew about it already. But the question of *where* her knowledge came from was a riddle which her memories were unable to solve. She had forgotten the source of all her information on this subject.¹

If I may suppose that the scene of the kiss took place in this way, I can arrive at the following derivation for the feelings of disgust.² Such feelings seem originally to be a reaction to the smell (and afterwards also to the sight) of excrement. But the genitals can act as a reminder of the excretory functions; and this applies especially to the male member, for that organ performs the function of micturition as well as the sexual function. Indeed, the function of micturition is the earlier known of the two, and the *only* one known during the pre-sexual period. Thus it happens that disgust becomes one of the means of affective expression in the sphere of sexual life. The Early Christian Father's '*inter urinas et faeces nascimur*' clings to sexual life and cannot be detached from it in spite of every effort at idealization. I should like, however, expressly to emphasize my opinion that the problem is not solved by the mere pointing out of this path of association. The fact that this association *can* be called up does not show that it actually *will* be called up. And indeed in normal circumstances it will not be. A knowledge of the paths does not render less necessary a knowledge of the forces which travel along them.³

¹ See the second dream .

² Here, as in all similar cases, the reader must be prepared to be met not by one but by several causes - by *overdetermination*.

³ All these discussions contain much that is typical and valid for hysteria in general. The subject of erection solves some of the most interesting hysterical symptoms. The attention that women pay to the outlines of men's genitals as seen through their clothing becomes, when it has been repressed, a source of the very frequent cases of avoiding company and of dreading society. - It is scarcely possible to exaggerate the pathogenic significance of the comprehensive tie uniting the sexual and the excremental, a tie which is at the basis of a very large number of hysterical phobias.

I did not find it easy, however, to direct the patient's attention to her relations with Herr K. She declared that she had done with him. The uppermost layer of all her associations during the sessions, and everything of which she was easily conscious and of which she remembered having been conscious the day before, was always connected with her father. It was quite true that she could not forgive her father for continuing his relations with Herr K. and more particularly with Frau K. But she viewed those relations in a very different light from that in which her father wished them to appear. In her mind there was no doubt that what bound her father to this young and beautiful woman was a common love-affair. Nothing that could help to confirm this view had escaped her perception, which in this connection was pitilessly sharp; *here there were no gaps to be found in her memory*. Their acquaintance with the K.'s had begun before her father's serious illness; but it had not become intimate until the young woman had officially taken on the position of nurse during that illness, while Dora's mother had kept away from the sick-room. During the first summer holidays after his recovery things had happened which must have opened everyone's eyes to the true character of this 'friendship'. The two families had taken a suite of rooms in common at the hotel. One day Frau K. had announced that she could not keep the bedroom which she had up till then shared with one of her children. A few days later Dora's father had given up his bedroom, and they had both moved into new rooms - the end rooms, which were only separated by the passage, while the rooms they had given up had not offered any such security against interruption. Later on, whenever she had reproached her father about Frau K., he had been in the habit of saying that he could not understand her hostility and that, on the contrary, his children had every reason for being grateful to Frau K. Her mother, whom she had asked for an explanation of this mysterious remark, had told her that her father had been so unhappy at that time that he had made up his mind to go into the wood and kill himself, and that Frau K., suspecting as much, had gone after him and had persuaded him by her entreaties to preserve his life for the sake of his family. Of course, Dora went on, she herself did not believe this story; no doubt the two of them had been seen together in the wood, and her father had thereupon invented this fairy tale of his suicide so as to account for their rendezvous.¹

When they had returned to B--, her father had visited Frau K. every day at definite hours, while her husband was at his business. Everybody had talked about it and had questioned her about it pointedly. Herr K. himself had often complained bitterly to her mother, though he had spared her herself any allusions to the subject - which she seemed to attribute to delicacy of feeling on his part. When they had all gone for walks together, her father and Frau K. had always known how to manage things so as to be alone with each other. There could be no doubt that she had taken money from him, for she spent more than she could possibly have afforded out of her own purse or her husband's. Dora added that her father had begun to make handsome presents to Frau K., and in order to make these less conspicuous had at the same time become especially liberal towards her mother and herself. And, while previously Frau K. had been an invalid and had even been obliged to spend months in a sanatorium for nervous disorders because she had been unable to walk, she had now become a healthy and lively woman.

¹ This is the point of connection with her own pretence at suicide, which may thus be regarded as the expression of a longing for a love of the same kind.

Even after they had left B-- for the manufacturing town, these relations, already of many years' standing, had been continued. From time to time her father used to declare that he could not endure the rawness of the climate, and that he must do something for himself; he would begin to cough and complain, until suddenly he would start off to B--, and from there write the most cheerful letters home. All these illnesses had only been pretexts for seeing his friend again. Then one day it had been decided that they were to move to Vienna and Dora began to suspect a hidden connection. And sure enough, they had scarcely been three weeks in Vienna when she heard that the K.'s had moved there as well. They were in Vienna, so she told me, at that very moment, and she frequently met her father with Frau K. in the street. She also met Herr K. very often, and he always used to turn round and look after her; and once when he had met her out by herself he had followed her for a long way, so as to make sure where she was going and whether she might not have a rendezvous.

On one occasion during the course of the treatment her father again felt worse, and went off to B-- for several weeks; and the sharp-sighted Dora had soon unearthed the fact that Frau K. had started off to the same place on a visit to her relatives there. It was at this time that Dora's criticisms of her father were the most frequent: he was insincere, he had a strain of falseness in his character, he only thought of his own enjoyment, and he had a gift for seeing things in the light which suited him best.

I could not in general dispute Dora's characterization of her father; and there was one particular respect in which it was easy to see that her reproaches were justified. When she was feeling embittered she used to be overcome by the idea that she had been handed over to Herr K. as the price of his tolerating the relations between her father and his wife; and her rage at her father's making such a use of her was visible behind her affection for him. At other times she was quite well aware that she had been guilty of exaggeration in talking like this. The two men had of course never made a formal agreement in which she was treated as an object for barter; her father in particular would have been horrified at any such suggestion. But he was one of those men who know how to evade a dilemma by falsifying their judgement upon one of the conflicting alternatives. If it had been pointed out to him that there might be danger for a growing girl in the constant and unsupervised companionship of a man who had no satisfaction from his own wife, he would have been certain to answer that he could rely upon his daughter, that a man like K. could never be dangerous to her, and that his friend was himself incapable of such intentions, or that Dora was still a child and was treated as a child by K. But as a matter of fact things were in a position in which each of the two men avoided drawing any conclusions from the other's behaviour which would have been awkward for his own plans. It was possible for Herr K. to send Dora flowers every day for a whole year while he was in the neighbourhood, to take every opportunity of giving her valuable presents, and to spend all his spare time in her company, without her parents noticing anything in his behaviour that was characteristic of love-making.

When a patient brings forward a sound and incontestable train of argument during psycho-analytic treatment, the physician is liable to feel a moment's embarrassment, and the patient may take advantage of it by asking: 'This is all perfectly correct and true, isn't it? What do you want to change in now that I've told it you?' But it soon becomes evident that the patient is using thoughts of this kind, which the analysis cannot attack, for the purpose of cloaking others which are anxious to escape from criticism and from consciousness. A string of reproaches against other people leads one to suspect the existence of a string of self-reproaches with the same content. All that need be done is to turn back each particular reproach on to the speaker himself. There is something undeniably automatic about this method of defending oneself against a self-reproach by making the same reproach against some one else. A model of it is to be found in the *tu quoque* arguments of children; if one of them is accused of being a liar, he will reply without an instant's hesitation: 'You're another.' A grown-up person who wanted to throw back abuse would look for some really exposed spot in his antagonist and would not necessarily lay the chief stress upon the same content being repeated. In paranoia the projection of a reproach on to another person without any alteration in its content and therefore without any consideration for reality becomes manifest as the process of forming delusions.

Dora's reproaches against her father had a 'lining' or 'backing' of self-reproaches of this kind with a corresponding content in every case, as I shall show in detail. She was right in thinking that her father did not wish to look too closely into Herr K.'s behaviour to his daughter, for fear of being disturbed in his own love-affair with Frau K. But Dora herself had done precisely the same thing. She had made herself an accomplice in the affair, and had dismissed from her mind every sign which tended to show its true character. It was not until after her adventure by the lake that her eyes were opened and that she began to apply such a severe standard to her father. During all the previous years she had given every possible assistance to her father's relations with Frau K. She would never go to see her if she thought her father was there; but, knowing that in that case the children would have been sent out, she would turn her steps in a direction where she would be sure to meet them, and would go for a walk with them. There had been some one in the house who had been anxious at an early stage to open her eyes to the nature of her father's relations with Frau K., and to induce her to take sides against her. This was her last governess, an unmarried woman, no longer young, who was well-read and of advanced views.¹ The teacher and her pupil were for a while upon excellent terms, until suddenly Dora became hostile to her and insisted on her dismissal. So long as the governess had any influence she used it for stirring up feeling against Frau K. She explained to Dora's mother that it was incompatible with her dignity to tolerate such an intimacy between her husband and another woman; and she drew Dora's attention to all the obvious features of their relations. But her efforts were in vain. Dora remained devoted to Frau K. and would hear of nothing that might make her think ill of her relations with her father. On the other hand she very easily fathomed the motives by which her governess was actuated. She might be blind in one direction, but she was sharp-sighted enough in the other. She saw that the governess was in love with her father. When he was there, she seemed to be quite another person: at such times she could be amusing and obliging. While the family were living in the manufacturing town and Frau K. was not on the horizon, her hostility was directed against Dora's mother, who was then her more immediate rival. Up to this point Dora bore her no ill-will. She did not become angry until she observed that she herself was a subject of complete indifference to the governess, whose pretended affection for her was really meant for her father. While her father was away from the manufacturing town the governess had no time to spare for her, would not go for walks with her, and took no interest in her studies. No sooner had her father returned from B-- than she was once more ready with every sort of service and assistance. Thereupon Dora dropped her.

¹ This governess used to read every sort of book on sexual life and similar subjects, and talked to the girl about them, at the same time asking her quite frankly not to mention their conversations to her parents, as one could never tell what line they might take about them. For some time I looked upon this woman as the source of all Dora's secret knowledge, and perhaps I was not entirely wrong in this.

The poor woman had thrown a most unwelcome light on a part of Dora's own behaviour. What the governess had from time to time been to Dora, Dora had been to Herr K.'s children. She had been a mother to them, she had taught them, she had gone for walks with them, she had offered them a complete substitute for the slight interest which their own mother showed in them. Herr K. and his wife had often talked of getting a divorce; but it never took place, because Herr K., who was an affectionate father, would not give up either of the two children. A common interest in the children had from the first been a bond between Herr K. and Dora. Her preoccupation with his children was evidently a cloak for something else that Dora was anxious to hide from herself and from other people.

The same inference was to be drawn both from her behaviour towards the children, regarded in the light of the governess's behaviour towards herself, and from her silent acquiescence in her father's relations with Frau K. - namely, that she had all these years been in love with Herr K. When I informed her of this conclusion she did not assent to it. It is true that she at once told me that other people besides (one of her cousins, for instance - a girl who had stopped with them for some time at B--) had said to her: 'Why you're simply wild about that man!' But she herself could not be got to recollect any feelings of the kind. Later on, when the quantity of material that had come up had made it difficult for her to persist in her denial, she admitted that she might have been in love with Herr K. at B--' but declared that since the scene by the lake it had all been over.¹ In any case it was quite certain that the reproaches which she made against her father of having been deaf to the most imperative calls of duty and of having seen things in the light which was most convenient from the point of view of his own passions - these reproaches recoiled on her own head.²

¹ Compare the second dream.

² The question then arises: If Dora loved Herr K., what was the reason for her refusing him in the scene by the lake? Or at any rate, why did her refusal take such a brutal form, as though she were embittered against him? And how could a girl who was in love feel insulted by a proposal which was made in a manner neither tactless nor offensive?.

Her other reproach against her father was that his ill-health was only a pretext and that he exploited it for his own purposes. This reproach, too, concealed a whole section of her own secret history. One day she complained of a professedly new symptom, which consisted of piercing gastric pains. 'Whom are you copying now?' I asked her, and found I had hit the mark. The day before she had visited her cousins, the daughters of the aunt who had died. The younger one had become engaged, and this had given occasion to the elder one for falling ill with gastric pains, and she was to be sent off to Semmering. Dora thought it was all just envy on the part of the elder sister; she always got ill when she wanted something, and what she wanted now was to be away from home so as not to have to look on at her sister's happiness.¹ But Dora's own gastric pains proclaimed the fact that she identified herself with her cousin, who, according to her, was a malingerer. Her grounds for this identification were either that she too envied the luckier girl her love, or that she saw her own story reflected in that of the elder sister, who had recently had a love-affair which had ended unhappily.² But she had also learned from observing Frau K. what useful things illnesses could become. Herr K. spent part of the year in travelling. Whenever he came back, he used to find his wife in bad health, although, as Dora knew, she had been quite well only the day before. Dora realized that the presence of the husband had the effect of making his wife ill, and that she was glad to be ill so as to be able to escape the conjugal duties which she so much detested. At this point in the discussion Dora suddenly brought in an allusion to her own alternations between poor and bad health during the first years of her girlhood at B--; and I was thus driven to suspect that her states of health were to be regarded as depending upon something else, in the same way as Frau K.'s. (It is a rule of psycho-analytic technique that an internal connection which is still undisclosed will announce its presence by means of a contiguity - a temporal proximity of associations; just as in writing, if 'a' and 'b' are put side by side, it means that the syllable 'ab' is to be formed out of them.) Dora had had a very large number of attacks of coughing accompanied by loss of voice. Could it be that the presence or absence of the man she loved had had an influence upon the appearance and disappearance of the symptoms of her illness? If this were so, it must be possible to discover some coincidence or other which would betray the fact. I asked her what the average length of these attacks had been. 'From three to six weeks, perhaps.' How long had Herr K.'s absences lasted? 'Three to six weeks, too', she was obliged to admit. Her illness was therefore a demonstration of her love for K., just as his wife's was a demonstration of her *dislike*. It was only necessary to suppose that her behaviour had been the opposite of Frau K.'s and that she had been ill when he was absent and well when he had come back. And this really seemed to have been so, at least during the first period of the attacks. Later on it no doubt became necessary to obscure the coincidence between her attacks of illness and the absence of the man she secretly loved, lest its regularity should betray her secret. The length of the attacks would then remain as a trace of their original significance.

¹ An event of everyday occurrence between sisters.

² I shall discuss later on what further conclusion I drew from these gastric pains.

I remembered that long before, while I was working at Charcot's clinic, I had seen and heard how in cases of hysterical mutism writing operated vicariously in the place of speech. Such patients were able to write more fluently, quicker, and better than others did or than they themselves had done previously. The same thing had happened with Dora. In the first days of her attacks of aphonia 'writing had always come specially easy to her'. No psychological elucidation was really required for this peculiarity, which was the expression of a physiological substitutive function enforced by necessity; it was noticeable, however, that such an elucidation was easily to be found. Herr K. used to write to her at length while he was travelling and to send her picture post-cards. It used to happen that she alone was informed as to the date of his return, and that his arrival took his wife by surprise. Moreover, that a person will correspond with an absent friend whom he cannot talk to is scarcely less obvious than that if he has lost his voice he will try to make himself understood in writing. Dora's aphonia, then, allowed of the following symbolic interpretation. When the man she loved was away she gave up speaking; speech had lost its value since she could not speak to *him*. On the other hand, writing gained in importance, as being the only means of communication with him in his absence.

Am I now going on to assert that in every instance in which there are periodical attacks of aphonia we are to diagnose the existence of a loved person who is at times away from the patient? Nothing could be further from my intention. The determination of Dora's symptoms is far too specific for it to be possible to expect a frequent recurrence of the same accidental aetiology. But, if so, what is the value of our elucidation of the aphonia in the present case? Have we not merely allowed ourselves to become the victims of a *jeu d'esprit*? I think not. In this connection we must recall the question which has so often been raised, whether the symptoms of hysteria are of psychical or of somatic origin, or whether, if the former is granted, they are necessarily *all* of them psychically determined. Like so many other questions to which we find investigators returning again and again without success, this question is not adequately framed. The alternatives stated in it do not cover the real essence of the matter. As far as I can see, every hysterical symptom involves the participation of *both* sides. It cannot occur without the presence of a certain degree of *somatic compliance* offered by some normal or pathological process in or connected with one of the bodily organs. And it cannot occur more than once - and the capacity for repeating itself is one of the characteristics of a hysterical symptom - unless it has a psychical significance, a *meaning*. The hysterical symptom does not carry this meaning with it, but the meaning is lent to it, soldered to it, as it were; and in every instance the meaning can be a different one, according to the nature of the suppressed thoughts which are struggling for expression. However, there are a number of factors at work which tend to make less arbitrary the relations between the unconscious thoughts and the somatic processes that are at their disposal as a means of expression, and which tend to make those relations approximate to a few typical forms. For therapeutic purposes the most important determinants are those given by the fortuitous psychical material; the clearing-up of the symptoms is achieved by looking for their psychical significance. When everything that can be got rid of by psycho-analysis has been cleared away, we are in a position to form all kinds of conjectures, which probably meet the facts, as regards the somatic basis of the symptoms - a basis which is as a rule constitutional and organic. Thus in Dora's case we shall not content ourselves with a psycho-analytic interpretation of her attacks of coughing and aphonia; but we shall also indicate the organic factor which was the source of the 'somatic compliance' that enabled her to express her love for a man who was periodically absent. And if the connection between the symptomatic expression and the unconscious mental content should strike us as being in this case a clever *tour de force*, we shall be relieved to hear that it succeeds in creating the same impression in every other case and in every other instance.

I am prepared to be told at this point that there is no very great advantage in having been taught by psycho-analysis that the clue to the problem of hysteria is to be found not in 'a peculiar instability of the molecules of the nerves' or in a liability to 'hypnotic states' - but in a 'somatic compliance'. But in reply to the objection I may remark that this new view has not only to some extent pushed the problem further back, but has also to some extent diminished it. We have no longer to deal with the *whole* problem, but only with the portion of it involving that particular characteristic of hysteria *which differentiates it* from other psychoneuroses. The mental events in all psycho-neuroses proceed for a considerable distance along the same lines before any question arises of the 'somatic compliance' which may afford the unconscious mental processes a physical outlet. When this factor is not forthcoming, something other than a hysterical symptom will arise out of the total situation; yet it will still be something of an allied nature, a phobia, perhaps, or an obsession - in short, a psychical symptom.

I now return to the reproach of malingering which Dora brought against her father. It soon became evident that this reproach corresponded to self-reproaches not only concerning her earlier states of ill-health but also concerning the present time. At such points the physician is usually faced by the task of guessing and filling in what the analysis offers him in the shape only of hints and allusions. I was obliged to point out to the patient that her present ill-health was just as much actuated by motives and was just as tendentious as had been Frau K.'s illness, which she had understood so well. There could be no doubt, I said, that she had an aim in view which she hoped to gain by her illness. That aim could be none other than to detach her father from Frau K. She had been unable to achieve this by prayers or arguments; perhaps she hoped to succeed by frightening her father (there was her farewell letter), or by awakening his pity (there were her fainting-fits), or if all this was in vain, at least she would be taking her revenge on him. She knew very well, I went on, how much he was attached to her, and that tears used to come into his eyes whenever he was asked after his daughter's health. I felt quite convinced that she would recover at once if only her father were to tell her that he had sacrificed Frau K, for the sake of her health. But, I added, I hoped he would not let himself be persuaded to do this, for then she would have learned what a powerful weapon she had in her hands, and she would certainly not fail on every future occasion to make use once more of her liability to ill health. Yet if her father refused to give way to her, I was quite sure she would not let herself be deprived of her illness so easily.

I will pass over the details which showed how entirely correct all of this was, and I will instead add a few general remarks upon the part played in hysteria by the *motives of illness*. A *motive* for being ill is sharply to be distinguished as a concept from a *potentiality* for illness - from the material out of which symptoms are formed. The motives have no share in the formation of symptoms, and indeed are not present at the beginning of the illness. They only appear secondarily to it; but it is not until they have appeared that the disease is fully constituted.¹ Their presence can be reckoned upon in every case in which there is real suffering and which is of fairly long standing. A symptom comes into the patient's mental life at first as an unwelcome guest; it has everything against it; and that is why it may vanish so easily, apparently of its own accord, under the influence of time. To begin with there is no use to which it can be put in the domestic economy of the mind; but very often it succeeds in finding one secondarily. Some psychical current or other finds it convenient to make use of it, and in that way the symptom manages to obtain a *secondary function* and remains, as it were, anchored fast in the patient's mental life. And so it happens that any one who tries to make him well is to his astonishment brought up against a powerful resistance, which teaches him that the patient's intention of getting rid of his complaint is not so entirely and completely serious as it seemed.² Let us imagine a workman, a bricklayer, let us say, who has fallen off a house and been crippled, and now earns his livelihood by begging at the street-corner. Let us then suppose that a miracle-worker comes along and promises him to make his crooked leg straight and capable of walking. It would be unwise, I think, to look forward to seeing an expression of peculiar bliss upon the man's features. No doubt at the time of the accident he felt he was extremely unlucky, when he realized that he would never be able to do any more work and would have to starve or live upon charity. But since then the very thing which in the first instance threw him out of employment has become his source of income: he lives by his disablement. If that is taken from him he may become totally helpless. He has in the meantime forgotten his trade and lost his habits of industry; he has grown accustomed to idleness, and perhaps to drink as well.

¹ [Footnote added 1923:] This is not quite right. The statement that the motives of illness are not present at the beginning of the illness, but only appear secondarily to it, cannot be maintained. In the very next paragraph motives for being ill are mentioned which were in existence before the outbreak of illness, and were partly responsible for that outbreak. I subsequently found a better way of meeting the facts, by introducing a distinction between the *primary* advantage derived from the illness and the *secondary* one. The motive for being ill is, of course, invariably the gaining of some advantage. What follows in the later sentences of this paragraph applies to the secondary gain. But in every neurotic illness a primary gain has also to be recognized. In the first place, falling ill involves a saving of psychical effort; it emerges as being economically the most convenient solution where there is a mental conflict (we speak of a 'flight into illness'), even though in most cases the ineffectiveness of such an escape becomes manifest at a later stage. This element in the primary gain may be described as the *internal* or psychological one, and it is, so to say, a constant one. But beyond this, external factors (such as in the instance given of the situation of a woman subjugated by her husband) may contribute motives for falling ill; and these will constitute the *external* element in the primary gain.

² A man of letters, who incidentally is also a physician - Arthur Schnitzler - has expressed this piece of knowledge very correctly in his *Paracelsus*.

The motives for being ill often begin to be active even in childhood. A little girl in her greed for love does not enjoy having to share the affection of her parents with her brothers and sisters; and she notices that the whole of their affection is lavished on her once more whenever she arouses their anxiety by falling ill. She has now discovered a means of enticing out her parents' love, and will make use of that means as soon as she has the necessary psychical material at her disposal for producing an illness. When such a child has grown up to be a woman she may find all the demands she used to make in her childhood countered owing to her marriage with an inconsiderate husband, who may subjugate her will, mercilessly exploit her capacity for work, and lavish neither his affection nor his money upon her. In that case ill-health will be her one weapon for maintaining her position. It will procure her the care she longs for; it will force her husband to make pecuniary sacrifices for her and to show her consideration, as he would never have done while she was well; and it will compel him to treat her with solicitude if she recovers, for otherwise a relapse will threaten. Her state of ill-health will have every appearance of being objective and involuntary - the very doctor who treats her will bear witness to the fact; and for that reason she will no need to feel any conscious self-reproaches at making such successful use of a means which she had found effective in her years of childhood.

And yet illnesses of this kind *are* the result of intention for the purposes they serve . They are as a rule levelled at a particular person, and consequently vanish with that person's departure. The crudest and most commonplace views on the character of hysterical disorder - such as are to be heard from uneducated relatives or nurses - are in a certain sense right. It is true that the paralysed and bedridden woman would spring to her feet if a fire were to break out in her room, and that the spoiled wife would forget all her sufferings if her child were to fall dangerously ill or if some catastrophe were to threaten the family circumstances. People who speak of the patients in this way are right except upon a single point: they overlook the psychological distinction between what is conscious and what is unconscious. This may be permissible where children are concerned, but with adults it is no longer possible. That is why all these asseverations that it is 'only a question of willing' and all the encouragements and abuse that are addressed to the patient are of no avail. An attempt must first be made by the roundabout methods of analysis to convince the patient herself of the existence in her of an intention to be ill.

It is in combating the motives of illness that the weak point in every kind of therapeutic treatment of hysteria lies. This is quite generally true, and it applies equally to psycho-analysis. Destiny has an easier time of it in this respect: it need not concern itself either with the patient's constitution or with his pathogenic material; it has only to take away a motive for being ill, and the patient is temporarily or perhaps even permanently freed from his illness. How many fewer miraculous cures and spontaneous disappearances of symptoms should we physicians have to register in cases of hysteria, if we were more often given a sight of the human interests which the patient keeps hidden from us! In one case, some stated period of time has elapsed; in a second, consideration for some other person has ceased to operate; in a third, the situation has been fundamentally changed by some external event - and the whole disorder which up till then had shown the greatest obstinacy, vanishes at a single blow, apparently of its own accord, but really because it has been deprived of its most powerful motive, one of the uses to which it has been put in the patient's life.

Motives that support the patient in being ill are probably to be found in all fully developed cases. But there are some in which the motives are purely internal - such as desire for self-punishment, that is, penitence and remorse. It will be found much easier to solve the therapeutic problem in such cases than in those in which the illness is related to the attainment of some external aim. In Dora's case that aim was clearly to touch her father's heart and to detach him from Frau K.

None of her father's actions seemed to have embittered her so much as his readiness to consider the scene by the lake as a product of her imagination. She was almost beside herself at the idea of its being supposed that she had merely fancied something on that occasion. For a long time I was in perplexity as to what the self-reproach could be which lay behind her passionate repudiation of this explanation of the episode. It was justifiable to suspect that there was something concealed, for a reproach which misses the mark gives no lasting offence. On the other hand, I came to the conclusion that Dora's story must correspond to the facts in every respect. No sooner had she grasped Herr K.'s intention than, without letting him finish what he had to say, she had given him a slap in the face and hurried away. Her behaviour must have seemed as incomprehensible to the man after she had left him as to us, for he must long before have gathered from innumerable small signs that he was secure of the girl's affections. In our discussion of Dora's second dream we shall come upon the solution of this riddle as well as upon the self-reproach which we have hitherto failed to discover.

As she kept on repeating her complaints against her father with a wearisome monotony, and as at the same time her cough continued, I was led to think that this symptom might have some meaning in connection with her father. And apart from this, the explanation of the symptom which I had hitherto obtained was far from fulfilling the requirements which I am accustomed to make of such explanations. According to a rule which I had found confirmed over and over again by experience, though I had not yet ventured to erect it into a general principle, a symptom signifies the representation - the realization - of a phantasy with a sexual content, that is to say, it signifies a sexual situation. It would be better to say that at least *one* of the meanings of a symptom is the representation of a sexual phantasy, but that no such limitation is imposed upon the content of its other meanings. Any one who takes up psycho-analytic work will quickly discover that a symptom has more than one meaning and serves to represent several unconscious mental processes simultaneously. And I should like to add that in my estimation a single unconscious mental process or phantasy will scarcely ever suffice for the production of a symptom.

An opportunity very soon occurred for interpreting Dora's nervous cough in this way by means of an imagined sexual situation. She had once again been insisting that Frau K. only loved her father because he was '*ein vermögender Mann*' ['a man of means']. Certain details of the way in which she expressed herself (which I pass over here, like most other purely technical parts of the analysis) led me to see that behind this phrase its opposite lay concealed, namely, that her father was '*ein unvernögender Mann*' ['a man without means']. This could only be meant in a sexual sense - that her father, as a man, was without means, was impotent.¹ Dora confirmed this interpretation from her conscious knowledge; whereupon I pointed out the contradiction she was involved in if on the one hand she continued to insist that her father's relation with Frau K. was a common love-affair, and on the other hand maintained that her father was impotent, or in other words incapable of carrying on an affair of such a kind. Her answer showed that she had no need to admit the contradiction. She knew very well, she said, that there was more than one way of obtaining sexual gratification. (The source of this piece of knowledge, however, was once more untraceable.) I questioned her further, whether she referred to the use of organs other than the genitals for the purpose of sexual intercourse, and she replied in the affirmative. I could then go on to say that in that case she must be thinking of precisely those parts of the body which in her case were in a state of irritation, - the throat and the oral cavity. To be sure, she would not hear of going so far as this in recognizing her own thoughts; and indeed, if the occurrence of the symptom was to be made possible at all, it was essential that she should not be completely clear on the subject. But the conclusion was inevitable that with her spasmodic cough, which, as is usual, was referred for its exciting stimulus to a tickling in her throat, she pictured to herself a scene of sexual gratification *per os* between the two people whose love-affair occupied her mind so incessantly. A very short time after she had tacitly accepted this explanation her cough vanished - which fitted in very well with my view; but I do not wish to lay too much stress upon this development, since her cough had so often before disappeared spontaneously.

¹ ['*Unvernögend*' means literally 'unable', and is commonly used in the sense of both 'not rich' and 'impotent'.]

This short piece of the analysis may perhaps have excited in the medical reader - apart from the scepticism to which he is entitled - feelings of astonishment and horror; and I am prepared at this point to look into these two reactions so as to discover whether they are justifiable. The astonishment is probably caused by my daring to talk about such delicate and unpleasant subjects to a young girl - or, for that matter, to any woman who is sexually active. The horror is aroused, no doubt, by the possibility that an inexperienced girl could know about practices of such a kind and could occupy her imagination with them. I would advise recourse to moderation and reasonableness upon both points. There is no cause for indignation either in the one case or in the other. It is possible for a man to talk to girls and women upon sexual matters of every kind without doing them harm and without bringing suspicion upon himself, so long as, in the first place, he adopts a particular way of doing it, and, in the second place, can make them feel convinced that it is unavoidable. A gynaecologist, after all, under the same conditions, does not hesitate to make them submit to uncovering every possible part of their body. The best way of speaking about such things is to be dry and direct; and that is at the same time the method furthest removed from the prurience with which the same subjects are handled in 'society', and to which girls and women alike are so thoroughly accustomed. I call bodily organs and processes by their technical names, and I tell these to the patient if they - the names, I mean - happen to be unknown to her. *J'appelle un chat un chat*. I have certainly heard of some people - doctors and laymen - who are scandalized by a therapeutic method in which conversations of this sort occur, and who appear to envy either me or my patients the titillation which, according to their notions, such a method must afford. But I am too well acquainted with the respectability of these gentry to excite myself over them. I shall avoid the temptation of writing a satire upon them. But there is one thing that I will mention: often, after I have for some time treated a patient who had not at first found it easy to be open about sexual matters, I have had the satisfaction of hearing her exclaim: 'Why, after all, your treatment is far more respectable than Mr. X.'s conversation!'

No one can undertake the treatment of a case of hysteria until he is convinced of the impossibility of avoiding the mention of sexual subjects, or unless he is prepared to allow himself to be convinced by experience. The right attitude is: '*pour faire une omlette il faut casser des oeufs.*' The patients themselves are easy to convince; and there are only too many opportunities of doing so in the course of the treatment. There is no necessity for feeling any compunction at discussing the facts of normal or abnormal sexual life with them. With the exercise of a little caution all that is done is to translate into conscious ideas what was already known in the unconscious; and, after all, the whole effectiveness of the treatment is based upon our knowledge that the affect attached to an unconscious idea operates more strongly and, since it cannot be inhibited, more injuriously than the affect attached to a conscious one. There is never any danger of corrupting an inexperienced girl. For where there is no knowledge of sexual processes even in the unconscious, no hysterical symptom will arise; and where hysteria is found there can no longer be any question of 'innocence of mind' in the sense in which parents and educators use the phrase. With children of ten, of twelve, or of fourteen, with boys and girls alike, I have satisfied myself that the truth of this statement can invariably be relied upon.

As regards the second kind of emotional reaction, which is not directed against me this time, but against my patient - supposing that my view of her is correct - and which regards the perverse nature of her phantasies as horrible, I should like to say emphatically that a medical man has no business to indulge in such passionate condemnation. I may also remark in passing that it seems to me superfluous for a physician who is writing upon the aberrations of the sexual instincts to seize every opportunity of inserting into the text expressions of his personal repugnance at such revolting things. We are faced by a fact; and it is to be hoped that we shall grow accustomed to it, when we have put our own tastes on one side. We must learn to speak without indignation of what we call the sexual perversions - instances in which the sexual function has extended its limits in respect either to the part of the body concerned or to the sexual object chosen. The uncertainty in regard to the boundaries of what is to be called normal sexual life, when we take different races and different epochs into account, should in itself be enough to cool the zealot's ardour. We surely ought not to forget that the perversion which is the most repellent to us, the sensual love of a man for a man, was not only tolerated by a people so far our superiors in cultivation as were the Greeks, but was actually entrusted by them with important social functions. The sexual life of each one of us extends to a slight degree - now in this direction, now in that - beyond the narrow lines imposed as the standard of normality. The perversions are neither bestial nor degenerate in the emotional sense of the word. They are a development of germs all of which are contained in the undifferentiated sexual disposition of the child, and which, by being suppressed or by being diverted to higher, asexual aims - by being 'sublimated' - are destined to provide the energy for a great number of our cultural achievements. When, therefore, any one has *become* a gross and manifest pervert, it would be more correct to say that he has *remained* one, for he exhibits a certain stage of *inhibited development*. All psychoneurotics are persons with strongly marked perverse tendencies, which have been repressed in the course of their development and have become unconscious. Consequently their unconscious *phantasies* show precisely the same content as the documentarily recorded *actions* of perverts - even though they have not read Krafft-Ebing's *Psychopathia Sexualis*, to which simple-minded people attribute such a large share of the responsibility for the production of perverse tendencies. Psychoneuroses are, so to speak, the *negative* of perversions. In neurotics their sexual constitution, under which the effects of heredity are included, operates in combination with any accidental influences in their life which may disturb the development of normal sexuality. A stream of water which meets with an obstacle in the river-bed is dammed up and flows back into old channels which had formerly seemed fated to run dry. The motive forces leading to the formation of hysterical symptoms draw their strength not only from repressed *normal* sexuality but also from unconscious perverse activities.¹

¹ These remarks upon the sexual perversions had been written some years before the appearance of Bloch's excellent book (*Beiträge zur Ätiologie der Psychopathia sexualis*, 1902 and 1903). See also my *Three Essays on the Theory of Sexuality*, published this year.

The less repellent of the so-called sexual perversions are very widely diffused among the whole population, as every one knows except medical writers upon the subject. Or, I should rather say, they know it too; only they take care to forget it at the moment when they take up their pens to write about it. So it is not to be wondered at that this hysterical girl of nearly nineteen, who had heard of the occurrence of such a method of sexual intercourse (sucking at the male organ), should have developed an unconscious phantasy of this sort and should have given it expression by an irritation in her throat and by coughing. Nor would it have been very extraordinary if she had arrived at such a phantasy even without having had any enlightenment from external sources - an occurrence which I have quite certainly observed in other patients. For in her case a noteworthy fact afforded the necessary somatic prerequisite for this independent creation of a phantasy which would coincide with the practices of perverts. She remembered very well that in her childhood she had been a thumb-sucker. Her father, too recollected breaking her of the habit after it had persisted into her fourth or fifth year. Dora herself had a clear picture of a scene from her early childhood in which she was sitting on the floor in a corner sucking her left thumb and at the same time tugging with her right hand at the lobe of her brother's ear as he sat quietly beside her. Here we have an instance of the complete form of self-gratification by sucking, as it has also been described to me by other patients, who had subsequently become anaesthetic and hysterical.

One of these patients gave me a piece of information which sheds a clear light on the origin of this curious habit. This young woman had never broken herself of the habit of sucking. She retained a memory of her childhood, dating back, according to her, to the first half of her second year, in which she saw herself sucking at her nurse's breast and at the same time pulling rhythmically at the lobe of her nurse's ear. No one will feel inclined to dispute, I think, that the mucous membrane of the lips and mouth is to be regarded as a primary 'erotogenic zone', since it preserves this earlier significance in the act of kissing, which is looked upon as normal. An intense activity of this erotogenic zone at an early age thus determines the subsequent presence of a somatic compliance on the part of the tract of mucous membrane which begins at the lips. Thus, at a time when the sexual object proper, that is, the male organ, has already become known, circumstances may arise which once more increase the excitation of the oral zone, whose erotogenic character has, as we have seen, been retained. It then needs very little creative power to substitute the sexual object of the moment (the penis) for the original object (the nipple) or for the finger which does duty for it, and to place the current sexual object in the situation in which gratification was originally obtained. So we see that this excessively repulsive and perverted phantasy of sucking at a penis has the most innocent origin. It is a new version of what may be described as a prehistoric impression of sucking at the mother's or nurse's breast - an impression which has usually been revived by contact with children who are being nursed. In most instances a cow's udder has aptly played the part of an image intermediate between a nipple and a penis.

The interpretation we have just been discussing of Dora's throat symptoms may also give rise to a further remark. It may be asked how this sexual situation imagined by her can be compatible with our other explanation of the symptoms. That explanation, it will be remembered, was to the effect that the coming and going of the symptoms reflected the presence and absence of the man she was in love with, and, as regards his wife's behaviour, expressed the following thought: 'If I were his wife, I should love him in quite a different way; I should be ill (from longing, let us say) when he was away, and well (from joy) when he was home again.' To this objection I must reply that my experience in the clearing-up of hysterical symptoms has shown that it is not necessary for the various meanings of a symptom to be compatible with one another, that is, to fit together into a connected whole. It is enough that the unity should be constituted by the subject-matter which has given rise to all the various phantasies. In the present case, moreover, compatibility even of the first kind is not out of the question. One of the two meanings is related more to the cough, and the other to the aphonia and the periodicity of the disorder. A closer analysis would probably have disclosed a far greater number of mental elements in relation to the details of the illness.

We have already learnt that it quite regularly happens that a single symptom corresponds to several meanings *simultaneously*. We may now add that it can express several meanings *in succession*. In the course of years a symptom can change its meaning or its chief meaning, or the leading role can pass from one meaning to another. It is as though there were a conservative trait in the character of neuroses which ensures that a symptom that has once been formed shall if possible be retained, even though the unconscious thought to which it gave expression has lost its meaning. Moreover, there is no difficulty in explaining this tendency towards the retention of a symptom upon a mechanical basis. The production of a symptom of this kind is so difficult, the translation of a purely psychical excitation into physical terms - the process which I have called 'conversion' - depends on the concurrence of so many favourable conditions, the somatic compliance necessary for conversion is so seldom forthcoming, that an impulsion towards the discharge of an unconscious excitation will so far as possible make use of any channel for discharge which may already be in existence. It appears to be far more difficult to create a fresh conversion than to form paths of association between a new thought which is in need of discharge and the old one which is no longer in need of it. The current flows along these paths from the new source of excitation to the old point of discharge - pouring into the symptom, in the words of the Gospel, like new wine into an old bottle. These remarks would make it seem that the somatic side of a hysterical symptom is the more stable of the two and the harder to replace, while the psychical side is a variable element for which a substitute can more easily be found. Yet we should not try to infer anything from this comparison as regards the relative importance of the two elements. From the point of view of mental therapeutics the mental side must always be the more significant.

Dora's incessant repetition of the same thoughts about her father's relations with Frau K. made it possible to derive still further important material from the analysis.

A train of thought such as this may be described as excessively intense, or better *reinforced*, or 'supervalent' ['*überwertig*'] in Wernicke's sense. It shows its pathological character in spite of its apparently reasonable content, by the single peculiarity that no amount of conscious and voluntary effort of thought on the patient's part is able to dissipate or remove it. A normal train of thought, however intense it may be, can eventually be disposed of. Dora felt quite rightly that her thoughts about her father required to be judged in a special way. 'I can think of nothing else', she complained again and again. 'I know my brother says we children have no right to criticize this behaviour of Father's. He declares that we ought not to trouble ourselves about it, and ought even to be glad, perhaps, that he has found a woman he can love, since Mother understands him so little. I can quite see that, and I should like to think the same as my brother, but I can't. I can't forgive him for it.'¹

Now what is one to do in the face of a supervalent thought like this, after one has heard what its conscious grounds are and listened to the ineffectual protests made against it? Reflection will suggest that *this excessively intense train of thought must owe its reinforcement to the unconscious*. It cannot be resolved by any effort of thought, either because it itself reaches with its root down into unconscious, repressed material, or because another unconscious thought lies concealed behind it. In the latter case, the concealed thought is usually the direct contrary of the supervalent one. Contrary thoughts are always closely connected with each other and are often paired off in such a way that *the one thought is excessively intensely conscious while its counterpart is repressed and unconscious*. This relation between the two thoughts is an effect of the process of repression. For repression is often achieved by means of an excessive reinforcement of the thought contrary to the one which is to be repressed. This process I call *reactive reinforcement*, and the thought which asserts itself with excessive intensity in consciousness and (in the same way as a prejudice) cannot be removed I call a *reactive thought*. The two thoughts then act towards each other much like the two needles of an astatic galvanometer. The reactive thought keeps the objectionable one under repression by means of a certain surplus of intensity; but for that reason it itself is 'damped' and proof against conscious efforts of thought. So that the way to deprive the excessively intense thought of its reinforcement is by bringing its repressed contrary into consciousness.

¹ A supervalent thought of this kind is often the only symptom, beyond deep depression, of a pathological condition which is usually described as 'melancholia', but which can be cleared up by psycho-analysis like a hysteria.

We must also be prepared to meet with instances in which the supervallence of a thought is due not to the presence of one only of these two causes but to a concurrence of both of them. Other complications, too, may arise, but they can easily be fitted into the general scheme.

Let us now apply our theory to the instance provided by Dora's case. We will begin with the first hypothesis, namely, that her preoccupation with her father's relations to Frau K, owed its obsessive character to the fact that its root was unknown to her and lay in the unconscious. It is not difficult to divine the nature of that root from her circumstances and her conduct. Her behaviour obviously went far beyond what would have been appropriate to filial concern. She felt and acted more like a jealous wife - in a way which would have been comprehensible in her mother. By her ultimatum to her father ('either her or me'), by the scenes she used to make, by the suicidal intentions she allowed to transpire, - by all this she was clearly putting herself in her mother's place. If we have rightly guessed the nature of the imaginary sexual situation which underlay her cough, in that phantasy she must have been putting herself in Frau K.'s place. She was therefore identifying herself both with the woman her father had once loved and with the woman he loved now. The inference is obvious that her affection for her father was a much stronger one than she knew or than she would have cared to admit: in fact, that she was in love with him.

I have learnt to look upon unconscious love relations like this (which are marked by their abnormal consequences) - between a father and a daughter, or between a mother and a son - as a revival of germs of feeling in infancy. I have shown at length elsewhere¹ at what an early age sexual attraction makes itself felt between parents and children, and I have explained that the legend of Oedipus is probably to be regarded as a poetical rendering of what is typical in these relations. Distinct traces are probably to be found in most people of an early partiality of this kind - on the part of a daughter for her father, or on the part of a son for his mother; but it must be assumed to be more intense from the very first in the case of those children whose constitution marks them down for a neurosis, who develop prematurely and have a craving for love. At this point certain other influences, which need not be discussed here, come into play, and lead to a fixation of this rudimentary feeling of love or to a reinforcement of it; so that it turns into something (either while the child is still young or not until it has reached the age of puberty) which must be put on a par with a sexual inclination and which, like the latter, has the forces of the libido at its command.² The nature of her disposition had always drawn her towards her father, and his numerous illnesses were bound to have increased her affection for him. In some of these illnesses he would allow no one but her to discharge the lighter duties of nursing. He had been so proud of the early growth of her intelligence that he had made her his confidante while she was still a child. It was really she and not her mother whom Frau K.'s appearance had driven out of more than one position.

¹ In my *Interpretation of Dreams*, 1900a, and in the third of my *Three Essays*, 1905d.

² The decisive factor in this connection is no doubt the early appearance of true genital sensations, either spontaneously or as a result of seduction or masturbation. (See below.)

When I told Dora that I could not avoid supposing that her affection for her father must at a very early moment have amounted to her being completely in love with him, she of course gave me her usual reply: 'I don't remember that.' But she immediately went on to tell me something analogous about a seven-year-old girl who was her cousin (on her mother's side) and in whom she often thought she saw a kind of reflection of her own childhood. This little girl had (not for the first time) been the witness of a heated dispute between her parents, and, when Dora happened to come in on a visit soon afterwards, whispered in her ear: 'You can't think how I hate that person!' (pointing to her mother), 'and when she's dead I shall marry Daddy.' I am in the habit of regarding associations such as this, which bring forward something that agrees with the content of an assertion of mine, as a confirmation from the unconscious of what I have said. No other kind of 'Yes' can be extracted from the unconscious; there is no such thing at all as an unconscious 'No'.¹

¹ [*Footnote added 1923:*] There is another very remarkable and entirely trustworthy form of confirmation from the unconscious, which I had not recognized at the time this was written: namely, an exclamation on the part of the patient of 'I didn't think that', or 'I didn't think of that'. This can be translated point-blank into: 'Yes, I was unconscious of that.'

For years on end she had given no expression to this passion for her father. On the contrary, she had for a long time been on the closest terms with the woman who had supplanted her with her father, and she had actually, as we know from her self-reproaches, facilitated this woman's relations with her father. Her own love for her father had therefore been recently revived; and, if so, the question arises to what end this had happened. Clearly as a reactive symptom, so as to suppress something else - something, that is, that still exercised power in the unconscious. Considering how things stood, I could not help supposing in the first instance that what was suppressed in this manner was her love of Herr K. I could not avoid the assumption that she was still in love with him, but that, for unknown reasons, since the scene by the lake her love had aroused in her violent feelings of opposition, and that the girl had brought forward and reinforced her old affection for her father in order to avoid and further necessity for paying conscious attention to the love which she had felt in the first years of her girlhood and which had now become distressing to her. In this way I gained an insight into a conflict which was well calculated to unhinge the girl's mind. On the one hand she was filled with regret at having rejected the man's proposal, and with longing for his company and all the little signs of his affection; while on the other hand these feelings of tenderness and longing were combated by powerful forces, amongst which her pride was one of the most obvious. Thus she had succeeded in persuading herself that she had done with Herr K. - that was the advantage she derived from this typical process of repression; and yet she was obliged to summon up her infantile affection for her father and to exaggerate it, in order to protect herself against the feelings of love which were constantly pressing forward into consciousness. The further fact that she was almost incessantly a prey to the most embittered jealousy seemed to admit of still another determination.¹

¹ We shall come upon this.

My expectations were by no means disappointed when this explanation of mine was met by Dora with a most emphatic negative. The 'No' uttered by a patient after a repressed thought has been presented to his conscious perception for the first time does no more than register the existence of a repression and its severity; it acts, as it were, as a gauge of the repression's strength. If this 'No', instead of being regarded as the expression of an impartial judgement (of which, indeed, the patient is incapable), is ignored, and if work is continued, the first evidence soon begins to appear that in such a case 'No' signifies the desired 'Yes'. Dora admitted that she found it impossible to be as angry with Herr K. as he had deserved. She told me that one day she had met Herr K. in the street while she was walking with a cousin of hers who did not know him. The other girl had exclaimed all at once: 'Why, Dora, what's wrong with you? You've gone as white as a sheet!' She herself had felt nothing of this change of colour; but I explained to her that the expression of emotion and the play of features obey the unconscious rather than the conscious, and are a means of betraying the former.¹ Another time Dora came to me in the worst of tempers after having been uniformly cheerful for several days. She could give no explanation of this. She felt so contrary to-day, she said; it was her uncle's birthday, and she could not bring herself to congratulate him, she did not know why. My powers of interpretation were at a low ebb that day; I let her go on talking, and she suddenly recollected that it was Herr K.'s birthday too - a fact which I did not fail to use against her. And it was then no longer hard to explain why the handsome presents she had had on her own birthday a few days before had given her no pleasure. One gift was missing, and that was Herr K.'s, the gift which had plainly once been the most prized of all.

Nevertheless Dora persisted in denying my contention for some time longer, until, towards the end of the analysis, the conclusive proof of its correctness came to light.

¹ Compare the lines:

Ruhig mag ich Euch erscheinen,
Ruhig gehen sehn.

[Quiet can I watch thy coming,
Quiet watch thee go.]

I must now turn to consider a further complication to which I should certainly give no space if I were a man of letters engaged upon the creation of a mental state like this for a short story, instead of being a medical man engaged upon its dissection. The element to which I must now allude can only serve to obscure and efface the outlines of the fine poetic conflict which we have been able to ascribe to Dora. This element would rightly fall a sacrifice to the censorship of a writer, for he, after all, simplifies and abstracts when he appears in the character of a psychologist. But in the world of reality, which I am trying to depict here, a complication of motives, an accumulation and conjunction of mental activities - in a word, overdetermination - is the rule. For behind Dora's supervalent train of thought which was concerned with her father's relations with Frau K. there lay concealed a feeling of jealousy which had that lady as its *object* - a feeling, that is, which could only be based upon an affection on Dora's part for one of her own sex. It has long been known and often been pointed out that at the age of puberty boys and girls show clear signs, even in normal cases, of the existence of an affection for people of their own sex. A romantic and sentimental friendship with one of her school friends, accompanied by vows, kisses, promises of eternal correspondence, and all the sensibility of jealousy, is the common precursor of a girl's first serious passion for a man. Thenceforward, in favourable circumstances, the homosexual current of feeling often runs completely dry. But if a girl is not happy in her love for a man, the current is often set flowing again by the libido in later years and is increased up to a greater or lesser degree of intensity. If this much can be established without difficulty of healthy persons, and if we take into account what has already been said about the fuller development in neurotics of the normal germs of perversion, we shall expect to find in these latter too a fairly strong homosexual predisposition. It must, indeed, be so; for I have never yet come through a single psycho-analysis of a man or a woman without having to take into account a very considerable current of homosexuality. When, in a hysterical woman or girl, the sexual libido which is directed towards men has been energetically suppressed, it will regularly be found that the libido which is directed towards women has become vicariously reinforced and even to some extent conscious.

I shall not in this place go any further into this important subject, which is especially indispensable to an understanding of hysteria in men, because Dora's analysis came to an end before it could throw any light on this side of her mental life. But I should like to recall the governess, whom I have already mentioned, and with whom Dora had at first enjoyed the closest interchange of thought, until she discovered that she was being admired and fondly treated not for her own sake but for her father's; whereupon she had obliged the governess to leave. She used also to dwell with noticeable frequency and a peculiar emphasis on the story of another estrangement which appeared inexplicable even to herself. She had always been on particularly good terms with the younger of her two cousins the girl who had later on become engaged - and had shared all sorts of secrets with her. When, for the first time after Dora had broken off her stay by the lake, her father was going back to B--, she had naturally refused to go with him. This cousin had then been asked to travel with him instead, and she had accepted the invitation. From that time forward Dora had felt a coldness towards her, and she herself was surprised to find how indifferent she had become, although, as she admitted, she had very little ground for complaint against her. These instances of sensitiveness led me to inquire what her relations with Frau K. had been up till the time of the breach. I then found that the young woman and the scarcely grown girl had lived for years on a footing of the closest intimacy. When Dora stayed with the K.'s she used to share a bedroom with Frau K., and the husband used to be quartered elsewhere. She had been the wife's confidante and adviser in all the difficulties of her married life. There was nothing they had not talked about. Medea had been quite content that Creusa should make friends with her two children; and she certainly did nothing to interfere with the relations between the girl and the children's father. How Dora managed to fall in love with the man about whom her beloved friend had so many bad things to say is an interesting psychological problem. We shall not be far from solving it when we realize that thoughts in the unconscious live very comfortably side by side, and even contraries get on together without disputes - a state of things which persists often enough even in the conscious.

When Dora talked about Frau K., she used to praise her 'adorable white body' in accents more appropriate to a lover than to a defeated rival. Another time she told me, more in sorrow than in anger, that she was convinced the presents her father had brought her had been chosen by Frau K., for she recognized her taste. Another time, again, she pointed out that, evidently through the agency of Frau K., she had been given a present of some jewellery which was exactly like some that she had seen in Frau K.'s possession and had wished for aloud at the time. Indeed, I can say in general that I never heard her speak a harsh or angry word against the lady, although from the point of view of her supervalent thought she should have regarded her as the prime author of her misfortunes. She seemed to behave inconsequently; but her apparent inconsequence was precisely the manifestation of a complicating current of feeling. For how had this woman to whom Dora was so enthusiastically devoted behaved to her? After Dora had brought forward her accusation against Herr K., and her father had written to him and had asked for an explanation, Herr K. had replied in the first instance by protesting sentiments of the highest esteem for her and by proposing that he should come to the manufacturing town to clear up every misunderstanding. A few weeks later, when her father spoke to him at B--, there was no longer any question of esteem. On the contrary, Herr K. spoke of her with disparagement, and produced as his trump card the reflection that no girl who read such books and was interested in such things could have any title to a man's respect. Frau K., therefore, had betrayed her and had calumniated her; for it had only been with her that she had read Mantegazza and discussed forbidden topics. It was a repetition of what had happened with the governess: Frau K. had not loved her for her own sake but on account of her father. Frau K. had sacrificed her without a moment's hesitation so that her relations with her father might not be disturbed. This mortification touched her, perhaps, more nearly and had a greater pathogenic effect than the other one, which she tried to use as a screen for it, - the fact that she had been sacrificed by her father. Did not the obstinacy with which she retained the particular amnesia concerning the sources of her forbidden knowledge point directly to the great emotional importance for her of the accusation against her upon that score, and consequently to her betrayal by her friend?

I believe, therefore, that I am not mistaken in supposing that Dora's supervalent train of thought, which was concerned with her father's relations with Frau K., was designed not only for the purpose of suppressing her love for Herr K., which had once been conscious, but also to conceal her love for Frau K., which was in a deeper sense unconscious. The supervalent train of thought was directly contrary to the latter current of feeling. She told herself incessantly that her father had sacrificed her to this woman, and made noisy demonstrations to show that she grudged her the possession of her father; and in this was she concealed from herself the contrary fact, which was that she grudged her father Frau K.'s love, and had not forgiven the woman she loved for the disillusionment she had been caused by her betrayal. The jealous emotions of a woman were linked in the unconscious with a jealousy such as might have been felt by a man. These masculine or, more properly speaking, *gynaecophilic* currents of feeling are to be regarded as typical of the unconscious erotic life of hysterical girls.

II

THE FIRST DREAM

Just at a moment when there was a prospect that the material that was coming up for analysis would throw light upon an obscure point in Dora's childhood, she reported that a few nights earlier she had once again had a dream which she had already dreamt in exactly the same way on many previous occasions. A periodically recurrent dream was by its very nature particularly well calculated to arouse my curiosity; and in any case it was justifiable in the interests of the treatment to consider the way in which the dream worked into the analysis as a whole. I therefore determined to make an especially careful investigation of it.

Here is the dream as related by Dora: '*A house was on fire.*¹ *My father was standing beside my bed and woke me up. I dressed quickly. Mother wanted to stop and save her jewel-case; but Father said: "I refuse to let myself and my two children be burnt for the sake of your jewel-case." We hurried downstairs, and as soon as I was outside I woke up.*'

As the dream was a recurrent one, I naturally asked her when she had first dreamt it. She told me she did not know. But she remembered having had the dream three nights in succession at L-- (the place on the lake where the scene with Herr K. had taken place), and it had now come back again a few nights earlier, here.² My expectations from the clearing-up of the dream were naturally heightened when I heard of its connection with the events at L--. But I wanted to discover first what had been the exciting cause of its recent recurrence, and I therefore asked Dora to take the dream bit by bit and tell me what occurred to her in connection with it. She had already had some training in dream-interpretation from having previously analysed a few minor specimens.

¹ In answer to an inquiry Dora told me that there had never really been a fire at their house.

² The content of the dream makes it possible to establish that it in fact occurred *for the first time* at L--.

'Something occurs to me,' she said, 'but it cannot belong to the dream, for it is quite recent, whereas I have certainly had the dream before.'

'That makes no difference,' I replied. 'Start away! It will simply turn out to be the most recent thing that fits in with the dream.'

'Very well, then. Father has been having a dispute with Mother in the last few days, because she locks the dining-room door at night. My brother's room, you see, has no separate entrance, but can only be reached through the dining-room. Father does not want my brother to be locked in like that at night. He says it will not do: something might happen in the night so that it might be necessary to leave the room.'

'And that made you think of the risk of fire?'

'Yes.'

'Now, I should like you to pay close attention to the exact words you used. We may have to come back to them. You said that "*something might happen in the night so that it might be necessary to leave the room*".'

But Dora had now discovered the connecting link between the recent exciting cause of the dream and the original one, for she continued:

'When we arrived at L-- that time, Father and I, he openly said he was afraid of fire. We arrived in a violent thunderstorm, and saw the small wooden house without any lightning-conductor. So his anxiety was quite natural.'

What I now had to do was to establish the relation between the events at L-- and the recurrent dreams which she had had there. I therefore said: 'Did you have the dream during your first nights at L-- or during your last ones? in other words, before or after the scene in the wood by the lake of which we have heard so much?' (I must explain that I knew that the scene had not occurred on the very first day, and that she had remained at L-- for a few days after it without giving any hint of the incident.)

¹ I laid stress on these words because they took me aback. They seemed to have an ambiguous ring about them. Are not certain physical needs referred to in the same words? Now, in a line of associations ambiguous words (or, as we may call them, 'switch-words') act like points at a junction. If the points are switched across from the position in which they appear to lie in the dream, then we find ourselves on another set of rails; and along this second track run the thoughts which we are in search of but which still lie concealed behind the dream.

Her first reply was that she did not know, but after a while she added: 'Yes. I think it was after the scene.' So now I knew that the dream was a reaction to that experience. But why had it recurred there three times? I continued my questions: 'How long did you stop on at L-- after the scene?'

'Four more nights. On the following day I went away with Father.'

'Now I am certain that the dream was an immediate effect of your experience with Herr K. It was at L-- that you dreamed it for the first time, and not before. You have only introduced this uncertainty in your memory so as to obliterate the connection in your mind.¹ But the figures do not quite fit in to my satisfaction yet. If you stayed at L-- for four nights longer, the dream might have occurred four times over. Perhaps this was so?'

She no longer disputed my contention; but instead of answering my question she proceeded:² 'In the afternoon after our trip on the lake, from which we (Herr K. and I) returned at midday, I had gone to lie down as usual on the sofa in the bed room to have a short sleep. I suddenly awoke and saw Herr K. standing beside me . . .'

'In fact, just as you saw your father standing beside your bed in the dream?'

'Yes. I asked him sharply what it was he wanted there. By way of reply he said he was not going to be prevented from coming into his own bedroom when he wanted; besides, there was something he wanted to fetch. This episode put me on my guard, and I asked Frau K. whether there was not a key to the bedroom door. The next morning I locked myself in while I was dressing. That afternoon, when I wanted to lock myself in so as to lie down again on the sofa, the key was gone. I was convinced that Herr K. had removed it.'

'Then here we have the theme of locking or not locking a room which appeared in the first association to the dream and also happened to occur in the exciting cause of the recent recurrence of the dream.³ I wonder whether the phrase "*I dressed quickly*" may not also belong to this context?'

¹ Compare what was said on p. 1359 on the subject of doubt accompanying a recollection.

² This was because a fresh piece of material had to emerge from her memory before the question I had put could be answered.

³ I suspected, though I did not as yet say so to Dora, that she had seized upon this element on account of a symbolic meaning which it possessed. '*Zimmer*' ['room'] in dreams stands very frequently for '*Frauenzimmer*' [a slightly derogatory word for 'woman'; literally, 'women's apartments']. The question whether a woman is 'open' or 'shut' can naturally not be a matter of indifference. It is well known, too, what sort of 'key' effects the opening in such a case.

'It was then that I made up my mind not to stop on with the K.'s without Father. On the subsequent mornings I could not help feeling afraid that Herr K. would surprise me while I was dressing: *so I always dressed very quickly*. You see, Father lived at the hotel, and Frau K. used always to go out early so as to go on expeditions with him. But Herr K. did not annoy me again.'

'I understand. On the afternoon of the day after the scene in the wood you formed your intention of escaping from his persecution, and during the second, third, and fourth nights you had time to repeat that intention in your sleep. (You already knew on the second afternoon - before the dream, therefore - that you would not have the key on the following morning to lock yourself in with while you were dressing; and you could then form the design of dressing as quickly as possible.) But your dream recurred each night, for the very reason that it corresponded to an intention. An intention remains in existence until it has been carried out. You said to yourself, as it were: "I shall have no rest and I can get no quiet sleep until I am out of this house." In your account of the dream you turned it the other way and said: "*As soon as I was outside I woke up.*".'

At this point I shall interrupt my report of the analysis in order to compare this small piece of dream-interpretation with the general statements I have made upon the mechanism of the formation of dreams. I argued in my book, *The Interpretation of Dreams* (1900a), that every dream is a wish which is represented as fulfilled, that the representation acts as a takes disguise if the wish is a repressed one, belonging to the unconscious, and that except in the case of children's dreams only an unconscious wish or one which reaches down into the unconscious has the force necessary for the formation of a dream. I fancy my theory would have been more certain of general acceptance if I had contented myself with maintaining that every dream had a meaning, which could be discovered by means of a certain process of interpretation; and that when the interpretation had been completed the dream could be replaced by thoughts which would fall into place at an easily recognizable point in the waking mental life of the dreamer. I might then have gone on to say that the meaning of a dream turned out to be of as many different sorts as the processes of waking thought; that in one case it would be a fulfilled wish, in another a realized fear, or again a reflection persisting on into sleep, or an intention (as in the instance of Dora's dream), or a piece of creative thought during sleep, and so on. Such a theory would no doubt have proved attractive from its very simplicity, and it might have been supported by a great many examples of dreams that had been satisfactorily interpreted, as for instance by the one which has been analysed in these pages.

But instead of this I formulated a generalization according to which the meaning of dreams is limited to a single form, to the representation of *wishes*, and by so doing I aroused a universal inclination to dissent. I must, however, observe that I did not consider it either my right or my duty to simplify a psychological process so as to make it more acceptable to my readers, when my researches had shown me that it presented a complication which could not be reduced to uniformity until the inquiry had been carried into another field. It is therefore of special importance to me to show that apparent exceptions such as this dream of Dora's, which has shown itself in the first instance to be the continuation into sleep of an intention formed during the day - nevertheless lend fresh support to the rule which is in dispute.

Much of the dream, however, still remained to be interpreted, and I proceeded with my questions: 'What is this about the jewel-case that your mother wanted to save?'

'Mother is very fond of jewellery and had had a lot given her by Father.'

'And you?'

'I used to be very fond of jewellery too, once; but I have not worn any since my illness. - Once, four years ago' (a year before the dream), 'Father and Mother had a great dispute about a piece of jewellery. Mother wanted to be given a particular thing - pearl drops to wear in her ears. But Father does not like that kind of thing, and he brought her a bracelet instead of the drops. She was furious, and told him that as he had spent so much money on a present she did not like he had better just give it to some one else.'

'I dare say you thought to yourself you would accept it with pleasure.'

'I don't know.'¹ I don't in the least know how Mother comes into the dream; she was not with us at L-- at the time.'²

'I will explain that to you presently. Does nothing else occur to you in connection with the jewel-case? So far you have only talked about jewellery and have said nothing about a case.'

'Yes, Herr K. had made me a present of an expensive jewel-case a little time before.'

'Then a return-present would have been very appropriate. Perhaps you do not know that "jewel-case" [*"Schmuckkästchen"*] is a favourite expression for the same thing that you alluded to not long ago by means of the reticule you were wearing³ - for the female genitals, I mean.'

'I knew you would say that.'⁴

¹ The regular formula with which she confessed to anything that had been repressed.

² This remark gave evidence of a complete misunderstanding of the rules of dream-interpretation, though on other occasions Dora was perfectly familiar with them. This fact, coupled with the hesitancy and meagreness of her associations with the jewel-case, showed me that we were here dealing with material which had been very intensely repressed.

³ This reference to the reticule will be explained further on.

⁴ A very common way of putting aside a piece of knowledge that emerges from the repressed.

'That is to say, you knew that it was so. - The meaning of the dream is now becoming even clearer. You said to yourself: "This man is persecuting me; he wants to force his way into my room. My 'jewel-case' is in danger, and if anything happens it will be Father's fault." For that reason in the dream you chose a situation which expresses the opposite - a danger from which your father is *saving* you. In this part of the dream everything is turned into its opposite; you will soon discover why. As you say, the mystery turns upon your mother. You ask how she comes into the dream? She is, as you know, your former rival in your father's affections. In the incident of the bracelet, you would have been glad to accept what your mother had rejected. Now let us just put "give" instead of "accept" and "withhold" instead of "reject". Then it means that you were ready to give your father what your mother withheld from him; and the thing in question was connected with jewellery.¹ Now bring your mind back to the jewel-case which Herr K. gave you. You have there the starting-point for a parallel line of thoughts, in which Herr K. is to be put in the place of your father just as he was in the matter of standing beside your bed. He gave you a jewel-case; so you are to give him your jewel-case. That was why I spoke just now of a "return-present". In this line of thoughts your mother must be replaced by Frau K. (You will not deny that she, at any rate, was present at the time.) So you are ready to give Herr K, what his wife withholds from him. That is the thought which has had to be repressed with so much energy, and which has made it necessary for every one of its elements to be turned into its opposite. The dream confirms once more what I had already told you before you dreamt it - that you are summoning up your old love for your father in order to protect yourself against your love for Herr K. But what do all these efforts show? Not only that you are afraid of Herr K., but that you are still more afraid of yourself, and of the temptation you feel to yield to him. In short, these efforts prove once more how deeply you loved him.'²

Naturally Dora would not follow me in this part of the interpretation. I myself, however, had been able to arrive at a further step in the interpretation, which seemed to me indispensable both for the anamnesis of the case and for the theory of dreams. I promised to communicate this to Dora at the next session.

¹ We shall be able later on to interpret even the drops in a way which will fit in with the context.

² I added: 'Moreover, the re-appearance of the dream in the last few days forces me to the conclusion that you consider that the same situation has arisen once again, and that you have decided to give up the treatment - to which, after all, it is only your father who makes you come.' The sequel showed how correct my guess had been. At this point my interpretation touches for a moment upon the subject of 'transference' - a theme which is of the highest practical and theoretical importance, but into which I shall not have much further opportunity of entering in the present paper.

The fact was that I could not forget the hint which seemed to be conveyed by the ambiguous words already noticed - *that it might be necessary to leave the room; that an accident might happen in the night*. Added to this was the fact that the elucidation of the dream seemed to me incomplete so long as a particular requirement remained unsatisfied; for, though I do not wish to insist that this requirement is a universal one, I have a predilection for discovering a means of satisfying it. A regularly formed dream stands, as it were, upon two legs, one of which is in contact with the main and current exciting cause, and the other with some momentous event in the years of childhood. The dream sets up a connection between those two factors - the event during childhood and the event of the present day - and it endeavours to re-shape the present on the model of the remote past. For the wish which creates the dream always springs from the period of childhood; and it is continually trying to summon childhood back into reality and to correct the present day by the measure of childhood. I believed that I could already clearly detect those elements of Dora's dream which could be pieced together into an allusion to an event in childhood.

I opened the discussion of the subject with a little experiment, which was, as usual, successful. There happened to be a large match-stand on the table. I asked Dora to look round and see whether she noticed anything special on the table, something that was not there as a rule. She noticed nothing. I then asked her if she knew why children were forbidden to play with matches.

'Yes; on account of the risk of fire. My uncle's children are very fond of playing with matches.'

'Not only on that account. They are warned not to "play with fire", and a particular belief is associated with the warning.'

She knew nothing about it. - 'Very well, then; the fear is that if they do they will wet their bed. The antithesis of "water" and "fire" must be at the bottom of this. Perhaps it is believed that they will dream of fire and then try and put it out with water. I cannot say exactly. But I notice that the antithesis of water and fire has been extremely useful to you in the dream. Your mother wanted to save the jewel-case so that it should not be *burnt*; while in the dream-thoughts it is a question of the "jewel-case" not being *wetted*. But fire is not only used as the contrary of water, it also serves directly to represent love (as in the phrase "to be *consumed* with love"). So that from "fire" one set of rails runs by way of this symbolic meaning to thoughts of love; while the other set runs by way of the contrary "water", and, after sending off a branch line which provides another connection with "love" (for love also makes things wet), leads in a different direction. And what direction can that be? Think of the expressions you used: that *an accident might happen in the night*, and that *it might be necessary to leave the room*. Surely the allusion must be to a physical need? And if you transpose the accident into childhood what can it be but bed-wetting? But what is usually done to prevent children from wetting their bed? Are they not woken up in the night out of their sleep, *exactly as your father woke you up in the dream*? This, then, must be the actual occurrence which enabled you to substitute your father for Herr K., who really, woke you up out of your sleep. I am accordingly driven to conclude that you were addicted to bed-wetting up to a later age than is usual with children. The same must also have been true of your brother; for your father said: "*I refuse to let my two children go to their destruction. . . .*" Your brother has no other sort of connection with the real situation at the K.'s; he had not gone with you to L--. And now, what have your recollections to say to this?'

'I know nothing about myself,' was her reply, 'but my brother used to wet his bed up till his sixth or seventh year; and it used sometimes to happen to him in the daytime too.'

I was on the point of remarking to her how much easier it is to remember things of that kind about one's brother than about oneself, when she continued the train of recollections which had been revived: 'Yes. I used to do it too, for some time, but not until my seventh or eighth year. It must have been serious, because I remember now that the doctor was called in. It lasted till a short time before my nervous asthma.'

'And what did the doctor say to it?'

'He explained it as nervous weakness; it would soon pass off, he thought; and he prescribed a tonic.'¹

¹ This physician was the only one in whom she showed any confidence, because this episode showed her that he had not penetrated her secret. She felt afraid of any other doctor about whom she had not yet been able to form a judgement, and we can now see that the motive of her fear was the possibility that he might guess her secret.

The interpretation of the dream now seemed to me to be complete.¹ But Dora brought me an addendum to the dream on the very next day. She had forgotten to relate, she said, that each time after waking up she had smelt smoke. Smoke, of course, fitted in well with fire, but it also showed that the dream had a special relation to myself; for when she used to assert that there was nothing concealed behind this or that, I would often say by way of rejoinder: 'There can be no smoke without fire!' Dora objected, however, to such a purely personal interpretation, saying that Herr K. and her father were passionate smokers - as I am too, for the matter of that. She herself had smoked during her stay by the lake, and Herr K. had rolled a cigarette for her before he began his unlucky proposal. She thought, too, that she clearly remembered having noticed the smell of smoke on the three occasions of the dream's occurrence at L--, and not for the first time at its recent reappearance. As she would give me no further information, it was left to me to determine how this addendum was to be introduced into the texture of the dream-thoughts. One thing which I had to go upon was the fact that the smell of smoke had only come up as an addendum to the dream, and must therefore have had to overcome a particularly strong effort on the part of repression. Accordingly it was probably related to the thoughts which were the most obscurely presented and the most successfully repressed in the dream, to the thoughts, that is, concerned with the temptation to show herself willing to yield to the man. If that were so, the addendum to the dream could scarcely mean anything else than the longing for a kiss, which, with a smoker, would necessarily smell of smoke. But a kiss had passed between Herr K. and Dora some two years further back, and it would certainly have been repeated more than once if she had given way to him. So the thoughts of temptation seemed in this way to have harked back to the earlier scene, and to have revived the memory of the kiss against whose seductive influence the little 'thumb-sucker' had defended herself at the time, by the feeling of disgust. Taking into consideration, finally, the indications which seemed to point to there having been a transference on to me - since I am a smoker too - I came to the conclusion that the idea had probably occurred to her one day during a session that she would like to have a kiss from me. This would have been the exciting cause which led her to repeat the warning dream and to form her intention of stopping the treatment. Everything fits together very satisfactorily upon this view; but owing to the characteristics of 'transference' its validity is not susceptible of definite proof.

¹ The essence of the dream might perhaps be translated into words such as these: 'The temptation is so strong. Dear Father, protect me again as you used to in my childhood, and prevent my bed from being wetted!'

I might at this point hesitate whether I should first consider the light thrown by this dream on the history of the case, or whether I should rather begin by dealing with the objection to my theory of dreams which may be based on its interpretation. I shall take the former course.

The significance of enuresis in the early history of neurotics is worth going into thoroughly. For the sake of clearness I will confine myself to remarking that Dora's case of bed-wetting was not the usual one. The disorder was not simply that the habit had persisted beyond what is considered the normal period, but, according to her explicit account, it had begun by disappearing and had then returned at a relatively late age - after her sixth year. Bed-wetting of this kind has, to the best of my knowledge, no more likely cause than masturbation, a habit whose importance in the aetiology of bed-wetting in general is still insufficiently appreciated. In my experience, the children concerned have themselves at one time been very well aware of this connection, and all its psychological consequences follow from it as though they had never forgotten it. Now, at the time when Dora reported the dream, we were engaged upon a line of enquiry which led straight towards an admission that she had masturbated in childhood. A short while before, she had raised the question of why it was that precisely she had fallen ill, and, before I could answer, had put the blame on her father. The justification for this was forthcoming not out of her unconscious thoughts but from her conscious knowledge. It turned out, to my astonishment, that the girl knew what the nature of her father's illness had been. After his return from consulting me she had overheard a conversation in which the name of the disease had been mentioned. At a still earlier period - at the time of the detached retina - an oculist who was called in must have hinted at a luetic aetiology; for the inquisitive and anxious girl overheard an old aunt of hers saying to her mother: 'He was ill before his marriage, you know', and adding something which she could not understand, but which she subsequently connected in her mind with improper subjects.

Her father, then, had fallen ill through leading a loose life, and she assumed that he had handed on his bad health to her by heredity. I was careful not to tell her that, as I have already mentioned, I too was of opinion that the offspring of luetics were very specially predisposed to severe neuropsychoses. The line of thought in which she brought this accusation against her father was continued in her unconscious material. For several days on end she identified herself with her mother by means of slight symptoms and peculiarities of manner, which gave her an opportunity for some really remarkable achievements in the direction of intolerable behaviour. She then allowed it to transpire that she was thinking of a stay she had made at Franzensbad, which she had visited with her mother - I forget in what year. Her mother was suffering from abdominal pains and from a discharge (a catarrh) which necessitated a cure at Franzensbad. It was Dora's view - and here again she was probably right - that this illness was due to her father, who had thus handed on his venereal disease to her mother. It was quite natural that in drawing this conclusion she should, like the majority of laymen, have confused gonorrhoea and syphilis, as well as what is contagious and what is hereditary. The persistence with which she held to this identification with her mother almost forced me to ask her whether she too was suffering from a venereal disease; and I then learnt that she was afflicted with a catarrh (leucorrhoea) whose beginning, she said, she could not remember.

I then understood that behind the train of thought in which she brought these open accusations against her father there lay concealed as usual a *self-accusation*. I met her half-way by assuring her that in my view the occurrence of leucorrhoea in young girls pointed primarily to masturbation, and I considered that all the other causes which were commonly assigned to that complaint were put in the background by masturbation.¹ I added that she was now on the way to finding an answer to her own question of why it was that precisely she had fallen ill - by confessing that she had masturbated, probably in childhood. Dora denied flatly that she could remember any such thing. But a few days later she did something which I could not help regarding as a further step towards the confession. For on that day she wore at her waist - a thing she never did on any other occasion before or after - a small reticule of a shape which had just come into fashion; and, as she lay on the sofa and talked, she kept playing with it - opening it, putting a finger into it, shutting it again, and so on. I looked on for some time, and then explained to her the nature of a 'symptomatic act'.² I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction. They are actions to which people would like to deny any significance, and which, if questioned about them, they would explain as being indifferent and accidental. Closer observation, however, will show that these actions, about which consciousness knows nothing or wishes to know nothing, in fact give expression to unconscious thoughts and impulses, and are therefore most valuable and instructive as being manifestations of the unconscious which have been able to come to the surface. There are two sorts of conscious attitudes possible towards these symptomatic acts. If we can ascribe inconspicuous motives to them we recognize their existence; but if no such pretext can be found for conscious use we usually fail altogether to notice that we have performed them. Dora found no difficulty in producing a motive: 'Why should I not wear a reticule like this, as it is now the fashion to do?' But a justification of this kind does not dismiss the possibility of the action in question having an unconscious origin. Though on the other hand the existence of such an origin and the meaning attributed to the act cannot be conclusively established. We must content ourselves with recording the fact that such a meaning fits in quite extraordinarily well with the situation as a whole and with the programme laid down by the unconscious.

¹ [Footnote added 1923:] This is an extreme view which I should no longer maintain to-day.

² See my *Psychopathology of Everyday Life*, 1901*b*.

On some other occasion I will publish a collection of these symptomatic acts as they are to be observed in the healthy and in neurotics. They are sometimes very easy to interpret. Dora's reticule, which came apart at the top in the usual way, was nothing but a representation of the genitals, and her playing with it, her opening it and putting her finger in it, was an entirely unembarrassed yet unmistakable pantomimic announcement of what she would like to do with them - namely, to masturbate. A very entertaining episode of a similar kind occurred to me a short time ago. In the middle of a session the patient - a lady who was no longer young - brought out a small ivory box, ostensibly in order to refresh herself with a sweet. She made some efforts to open it, and then handed it to me so that I might convince myself how hard it was to open. I expressed my suspicion that the box must mean something special, for this was the very first time I had seen it, although its owner had been coming to me for more than a year. To this the lady eagerly replied: 'I always have this box about me; I take it with me wherever I go.' She did not calm down until I had pointed out to her with a laugh how well her words were adapted to quite another meaning. The box - *Dose*, *πύξις* -, like the reticule and the jewel-case, was once again only a substitute for the shell of Venus, for the female genitals.

There is a great deal of symbolism of this kind in life, but as a rule we pass it by without heeding it. When I set myself the task of bringing to light what human beings keep hidden within them, not by the compelling power of hypnosis, but by observing what they say and what they show, I thought the task was a harder one than it really is. He that has eyes to see and ears to hear may convince himself that no mortal can keep a secret. If his lips are silent, he chatters with his finger-tips; betrayal oozes out of him at every pore. And thus the task of making conscious the most hidden recesses of the mind is one which it is quite possible to accomplish.

Dora's symptomatic act with the reticule did not immediately precede the dream. She started the session which brought us the narrative of the dream with another symptomatic act. As I came into the room in which she was waiting she hurriedly concealed a letter which she was reading. I naturally asked her whom the letter was from, and at first she refused to tell me. Something then came out which was a matter of complete indifference and had no relation to the treatment. It was a letter from her grandmother, in which she begged Dora to write to her more often. I believe that Dora only wanted to play 'secrets' with me, and to hint that she was on the point of allowing her secret to be torn from her by the doctor. I was then in a position to explain her antipathy to every new doctor. She was afraid lest he might arrive at the foundation of her illness, either by examining her and discovering her catarrh, or by questioning her and eliciting the fact of her addiction to bed-wetting - lest he might guess, in short, that she had masturbated. And afterwards she would speak very contemptuously of the doctor whose perspicacity she had evidently over-estimated beforehand.

The reproaches against her father for having made her ill, together with the self-reproach underlying them, the leucorrhoea, the playing with the reticule, the bed-wetting after her sixth year, the secret which she would not allow the doctors to tear from her - the circumstantial evidence of her having masturbated in childhood seems to me complete and without a flaw. In the present case I had begun to suspect the masturbation when she had told me of her cousin's gastric pains, and had then identified herself with her by complaining for days together of similar painful sensations. It is well known that gastric pains occur especially often in those who masturbate. According to a personal communication made to me by Wilhelm Fliess, it is precisely gastralgias of this character which can be interrupted by an application of cocaine to the 'gastric spot' discovered by him in the nose, and which can be cured by the cauterization of the same spot. In confirmation of my suspicion Dora gave me two facts from her conscious knowledge: she herself had frequently suffered from gastric pains, and she had good reasons for believing that her cousin was a masturbator. It is a very common thing for patients to recognize in other people a connection which, on account of their emotional resistances, they cannot perceive in themselves. And, indeed, Dora no longer denied my supposition, although she still remembered nothing. Even the date which she assigned to the bed-wetting, when she said that it lasted 'till a short time before the appearance of the nervous asthma', appears to me to be of clinical significance. Hysterical symptoms hardly ever appear so long as children are masturbating, but only afterwards, when a period of abstinence has set in;¹ they form a substitute for masturbatory satisfaction, the desire for which continues to persist in the unconscious until another and more normal kind of satisfaction appears - where that is still attainable. For upon whether it is still attainable or not depends the possibility of a hysteria being cured by marriage and normal sexual intercourse. But if the satisfaction afforded in marriage is again removed - as it may be owing to *coitus interruptus*, psychological estrangement, or other causes - then the libido flows back again into its old channel and manifests itself once more in hysterical symptoms.

¹ This is also true in principle of adults; but in their case a *relative* abstinence, a diminution in the amount of masturbation, is a sufficient cause, so that, if the libido is very strong, hysteria and masturbation may be simultaneously present.

I should like to be able to add some definite information as to when and under what particular influence Dora gave up masturbating; but owing to the incompleteness of the analysis I have only fragmentary material to present. We have heard that the bed-wetting lasted until shortly before she first fell ill with dyspnoea. Now the only light she was able to throw upon this first attack was that at the time of its occurrence her father was away from home for the first time since his health had improved. In this small recollection there must be a trace of an allusion to the aetiology of the dyspnoea. Dora's symptomatic acts and certain other signs gave me good reasons for supposing that the child, whose bedroom had been next door to her parents', had overheard her father in his wife's room at night and had heard him (for he was always short of breath) breathing hard while they had intercourse. Children, in such circumstances, divine something sexual in the uncanny sounds that reach their ears. Indeed, the movements expressive of sexual excitement lie within them ready to hand, as innate pieces of mechanism. I maintained years ago that the dyspnoea and palpitations that occur in hysteria and anxiety neurosis are only detached fragments of the act of copulation; and in many cases, as in Dora's, I have been able to trace back the symptom of dyspnoea or nervous asthma to the same exciting cause - to the patient's having overheard sexual intercourse taking place between adults. The sympathetic excitement which may be supposed to have occurred in Dora on such an occasion may very easily have made the child's sexuality veer round and have replaced her inclination to masturbation by an inclination to anxiety. A little while later, when her father was away and the child, devotedly in love with him, was wishing him back, she must have reproduced in the form of an attack of asthma the impression she had received. She had preserved in her memory the event which had occasioned the first onset of the symptom, and we can conjecture from it the nature of the train of thought, charged with anxiety, which had accompanied the attack. The first attack had come on after she had over-exerted herself on an expedition in the mountains, so that she had probably been really a little out of breath. To this was added the thought that her father was forbidden to climb mountains and was not allowed to over-exert himself, because he suffered from shortness of breath; then came the recollection of how much he had exerted himself with her mother that night, and the question whether it might not have done him harm; next came concern whether *she* might not have over-exerted herself in masturbating - an act which, like the other, led to a sexual orgasm accompanied by slight dyspnoea - and finally came a return of the dyspnoea in an intensified form as a symptom. Part of this material I was able to obtain directly from the analysis, but the rest required supplementing. But the way in which the occurrence of masturbation in Dora's case was verified has already shown us that material belonging to a single subject can only be collected piece by piece at various times and in different connections.¹

¹ The proof of infantile masturbation in other cases is established in a precisely similar way. The evidence for it is mostly of a similar nature: indications of the presence of leucorrhoea, bed-wetting, hand-ceremonials (obsessional washing), and such things. It is always possible to discover with certainty from the nature of the symptoms of the case whether the habit was discovered by the person in charge of the child or not, or whether this sexual activity was brought to an end by long efforts on the child's part to break itself of the habit, or by a sudden change. In Dora's case the masturbation had remained undiscovered, and had come to an end at a single blow (cf. her secret, her fear of doctors, and the replacement by dyspnoea). The patients, it is true, invariably dispute the conclusiveness of circumstantial evidence such as this, and they do so even when they have retained a conscious recollection of the catarrh or of their mother's warning (e.g. 'That makes people stupid; it's dangerous'). But some time later the memory, which has been so long repressed, of this piece of infantile sexual life emerges with certainty, and it does so in every instance. I am reminded of the case of a patient of mine suffering from obsessions, which were direct derivatives of infantile masturbation. Her peculiarities, such as self-prohibitions and self-punishments, the feeling that if she had done this she must not do that, the idea that she must not be interrupted, the introduction of pauses between one procedure (with her hands) and the next, her hand-washing, etc., - all of these turned out to be unaltered fragments of her nurse's efforts to break her of the habit. The only thing which had remained permanently in her memory were the words of warning: 'Ugh! That's dangerous!' Compare also in this connection my *Three Essays on the Theory of Sexuality*, 1905d.

There now arise a whole series of questions of the greatest importance concerning the aetiology of hysteria: is Dora's case to be regarded as aetiologically typical? does it represent the only type of causation? and so on. Nevertheless, I am sure that I am taking the right course in postponing my answer to such questions until a considerable number of other cases have been similarly analysed and published. Moreover, I should have to begin by criticizing the way in which the questions are framed. Instead of answering 'Yes' or 'No' to the question whether the aetiology of this case is to be looked for in masturbation during childhood, I should first have to discuss the concept of aetiology as applied to the psychoneuroses. It would then become evident that the standpoint from which I should be able to answer the question would be very widely removed from the standpoint from which it was put. Let it suffice if we can reach the conviction that in this case the occurrence of masturbation in childhood is established, and that its occurrence cannot be an accidental element nor an immaterial one in the conformation of the clinical picture.¹

¹ Dora's brother must have been concerned in some way with her having acquired the habit of masturbation; for in this connection she told me, with all the emphasis which betrays the presence of a 'screen memory', that her brother used regularly to pass on all his infectious illnesses to her, and that while he used to have them lightly she used, on the contrary, to have them severely. In the dream her brother as well as she was saved from 'destruction'; he, too, had been subject to bed-wetting, but had got over the habit before his sister. Her declaration that she had been able to keep abreast with her brother up to the time of her first illness, but that after that she had fallen behind him in her studies, was in a certain sense also a 'screen memory'. It was as though she had been a boy up till that moment, and had then become girlish for the first time. She had in truth been a wild creature; but after the 'asthma' she became quiet and well-behaved. That illness formed the boundary between two phases of her sexual life, of which the first was masculine in character, and the second feminine.

A consideration of the significance of the leucorrhoea to which Dora admitted promises to give us a still better understanding of her symptoms. She had learnt to call her affection a 'catarrh' at the time when her mother had had to visit Franzensbad on account of a similar complaint; and the word 'catarrh' acted once again as a 'switch-word' and enabled the whole set of thoughts upon her father's responsibility for her illness to manifest themselves in the symptom of the cough. The cough, which no doubt originated in the first instance from a slight actual catarrh, was, moreover, an imitation of her father (whose lungs were affected), and could serve as an expression of her sympathy and concern for him. But besides this, it proclaimed aloud, as it were, something of which she may then have been still unconscious: 'I am my father's daughter. I have a catarrh, just as he has. He has made me ill, just as he has made Mother ill. It is from him that I have got my evil passions, which are punished by illness.'¹

¹ This word played the same part with the fourteen-year old girl whose case history I have compressed into a few lines on p. 1365 n. I had established the child in a pension with an intelligent lady, who took charge of her for me. The lady reported that the little girl could not bear her to be in the room while she was going to bed, and that when she was in bed she had a marked cough, of which there was no trace in the daytime. When the girl was questioned about these symptoms, the only thing that occurred to her was that her grandmother coughed in the same way, and that she was said to have a catarrh. It was clear from this that the child herself had a catarrh, and that she did not want to be observed while she performed her evening ablutions. This catarrh which, thanks to its name, had been *displaced from the lower to the upper part of her body*, exhibited a quite unusual degree of intensity.

Let us next attempt to put together the various determinants that we have found for Dora's attacks of coughing and hoarseness. In the lowest stratum we must assume the presence of real and organically determined irritation of the throat - which acted like the grain of sand around which an oyster forms its pearl. This irritation was susceptible to fixation, because it concerned a part of the body which in Dora had to a high degree retained its significance as an erotogenic zone. And the irritation was consequently well fitted to give expression to excited states of the libido. It was brought to fixation by what was probably its first psychical coating - her sympathetic imitation of her father - and by her subsequent self-reproaches on account of her 'catarrh'. The same group of symptoms, moreover, showed itself capable of representing her relations with Herr K.; it could express her regret at his absence and her wish to make him a better wife. After a part of her libido had once more turned towards her father, the symptom obtained what was perhaps its last meaning; it came to represent sexual intercourse with her father by means of Dora's identifying herself with Frau K. I can guarantee that this series is by no means complete. Unfortunately, an incomplete analysis cannot enable us to follow the chronological sequence of the changes in a symptom's meaning, or to display clearly the succession and coexistence of its various meanings. It may legitimately be expected of a complete analysis that it should fulfil these demands.

I must now proceed to touch upon some further relations existing between Dora's genital catarrh and her hysterical symptoms. At a time when any psychological elucidation of hysteria was still very remote, I used to hear experienced fellow-doctors who were my seniors maintain that in the case of hysterical patients suffering from leucorrhoea any increase in the catarrh was regularly followed by an intensification of the hysterical troubles, and especially of loss of appetite and vomiting. No one was very clear about the nature of the connection but I fancy the general inclination was towards the opinion held by gynaecologists. According to their hypothesis, as is well known, disorders of the genitals exercise upon the nervous functions a direct and far-reaching influence in the nature of an organic disturbance - though a therapeutic test of this theory is apt to leave one in the lurch. In the light of our present knowledge we cannot exclude the possibility of the existence of a direct organic influence of this sort; but it is at all events easier to indicate its psychical coating. The pride taken by women in the appearance of their genitals is quite a special feature of their vanity; and disorders of the genitals which they think calculated to inspire feelings of repugnance or even disgust have an incredible power of humiliating them, of lowering their self-esteem, and of making them irritable, sensitive, and distrustful. An abnormal secretion of the mucous membrane of the vagina is looked upon as a source of disgust.

It will be remembered that Dora had a lively feeling of disgust after being kissed by Herr K., and that we saw grounds for completing her story of the scene of the kiss by supposing that, while she was being embraced, she noticed the pressure of the man's erect member against her body. We now learn further that the same governess whom Dora cast off on account of her faithlessness had, from her own experience of life, propounded to Dora the view that all men were frivolous and untrustworthy. To Dora that must mean that all men were like her father. But she thought her father suffered from venereal disease - for had he not handed it on to her and her mother? She might therefore have imagined to herself that all men suffered from venereal disease, and naturally her conception of venereal disease was modelled on her one experience of it - a personal one at that. To suffer from venereal disease, therefore, meant for her to be afflicted with a disgusting discharge. So may we not have here a further motive for the disgust she felt at the moment of the embrace? Thus the disgust which was transferred on to the contact of the man would be a feeling which had been projected according to the primitive mechanism I have already mentioned (p. 1373), and would be related ultimately to her own leucorrhoea.

I suspect that we are here concerned with unconscious processes of thought which are twined around a pre-existing structure of organic connections, much as festoons of flowers are twined around a wire; so that on another occasion one might find other lines of thought inserted between the same points of departure and termination. Yet a knowledge of the thought connections which have been effective in the individual case is of a value which cannot be exaggerated for clearing up the symptoms. It is only because the analysis was prematurely broken off that we have been obliged in Dora's case to resort to framing conjectures and filling in deficiencies. Whatever I have brought forward for filling up the gaps is based upon other cases which have been more thoroughly analysed.

The dream from the analysis of which we have derived this information corresponded, as we have seen, to an intention which Dora carried with her into her sleep. It was therefore repeated each night until the intention had been carried out; and it reappeared years later when an occasion arose for forming an analogous intention. The intention might have been consciously expressed in some such words as these: 'I must fly from this house, for I see that my virginity is threatened here; I shall go away with my father, and I shall take precautions not to be surprised while I am dressing in the morning.' These thoughts were clearly expressed in the dream; they formed part of a mental current which had achieved consciousness and a dominating position in waking life. Behind them can be discerned obscure traces of a train of thought which formed part of a contrary current and had consequently been suppressed. This other train of thought culminated in the temptation to yield to the man, out of gratitude for the love and tenderness he had shown her during the last few years, and it may perhaps have revived the memory of the only kiss she had so far had from him. But according to the theory which I developed in my *Interpretation of Dreams* such elements as these are not enough for the formation of a dream. On that theory a dream is not an intention represented as having been carried out, but a wish represented as having been fulfilled, and, moreover, in most cases a wish dating from childhood. It is our business now to discover whether this principle may not be contradicted by the present dream.

The dream does in fact contain infantile material, though it is impossible at a first glance to discover any connections between that material and Dora's intention of flying from Herr K.'s house and the temptation of his presence. Why should a recollection have emerged of her bed-wetting when she was a child and of the trouble her father used to take to teach the child clean habits? We may answer this by saying that it was only by the help of this train of thought that it was possible to suppress the other thoughts which were so intensely occupied with the temptation to yield or that it was possible to secure the dominance of the intention which had been formed of combating those other thoughts. The child decided to fly *with* her father; in reality she fled *to* her father because she was afraid of the man who was pursuing her; she summoned up an infantile affection for her father so that it might protect her against her present affection for a stranger. Her father was himself partly responsible for her present danger, for he had handed her over to this strange man in the interests of his own love-affair. And how much better it had been when that same father of hers had loved no one more than her, and had exerted all his strength to save her from the dangers that had then threatened her! The infantile, and now unconscious, wish to put her father in the strange man's place had the potency necessary for the formation of a dream. If there were a past situation similar to a present one, and differing from it only in being concerned with one instead of with the other of the two persons mentioned in the wish, that situation would become the main one in the dream. But there *had* been such a situation. Her father had once stood beside her bed, just as Herr K. had the day before, and had woken her up, with a kiss perhaps, as Herr K. may have meant to do. Thus her intention of flying from the house was not in itself capable of producing a dream; but it became so by being associated with another intention which was founded upon infantile wishes. The wish to replace Herr K. by her father provided the necessary motive power for the dream. Let me recall the interpretation I was led to adopt of Dora's reinforced train of thought about her father's relations with Frau K. My interpretation was that she had at that point summoned up an infantile affection for her father so as to be able to keep her repressed love for Herr K. in its state of repression. This same sudden revulsion in the patient's mental life was reflected in the dream.

I have made one or two observations in my *Interpretation of Dreams* on the relation between the waking thoughts which are continued into sleep (the 'day's residues') and the unconscious wish which forms the dream. I will quote them here as they stand, for I have nothing to add to them, and the analysis of this dream of Dora's proves afresh that the facts are as I have supposed: 'I am ready to admit that there is a whole class of dreams the *instigation* to which arises principally or even exclusively from the residues of daytime life; and I think that even my wish that I might at long last become a Professor Extraordinarius¹ might have allowed me to sleep through the night in peace if my worry over my friend's health had not still persisted from the previous day. But the worry alone could not have made a dream. The *motive force* which the dream required had to be provided by a wish; it was the business of the worry to get hold of a wish to act as the motive force of the dream.

'The position may be explained by an analogy. A daytime thought may very well play the part of *entrepreneur* for a dream; but the *entrepreneur*, who, as people say, has the idea and the initiative to carry it out, can do nothing without capital; he needs a *capitalist* who can afford the outlay, and the capitalist who provides the psychical outlay for the dream is invariably and indisputably, whatever may be the thoughts of the previous day, *a wish from the unconscious*.'

Any one who has learnt to appreciate the delicacy of the fabric of structures such as dreams will not be surprised to find that Dora's wish that her father might take the place of the man who was her tempter called up in her memory not merely a casual collection of material from her childhood, but precisely such material as was most intimately bound up with the suppression of her temptation. For if Dora felt unable to yield to her love for the man, if in the end she repressed that love instead of surrendering to it, there was no factor upon which her decision depended more directly than upon her premature sexual enjoyment and its consequence - her bed-wetting, her catarrh, and her disgust. An early history of this kind can afford a basis for two kinds of behaviour in response to the demands of love in maturity - which of the two will depend upon the summation of constitutional determinants in the subject. He will either exhibit an abandonment to sexuality which is entirely without resistances and borders upon perversity; or there will be a reaction - he will repudiate sexuality, and will at the same time fall ill of a neurosis. In the case of our present patient, her constitution and the high level of her intellectual and moral upbringing decided in favour of the latter course.

¹ This is a reference to the analysis of a dream quoted in the book as an example.

I should like, further, to draw special attention to the fact that the analysis of this dream has given us access to certain details of the pathogenically operative events which had otherwise been inaccessible to memory, or at all events to reproduction. The recollection of the bed-wetting in childhood had, as we have seen, already been repressed. And Dora had never mentioned the details of her persecution by Herr K.; they had never occurred to her mind.

I add a few remarks which may help towards the synthesis of this dream. The dream-work began on the afternoon of the day after the scene in the wood, after Dora had noticed that she was no longer able to lock the door of her room. She then said to herself: 'I am threatened by a serious danger here,' and formed her intention of not stopping on in the house alone but of going off with her father. This intention became capable of forming a dream, because it succeeded in finding a continuation in the unconscious. What corresponded to it there was her summoning up her infantile love for her father as a protection against the present temptation. The change which thus took place in her became fixed and brought her into the attitude shown by her supervalent train of thought - jealousy of Frau K. on her father's account, as though she herself were in love with him. There was a conflict within her between a temptation to yield to the man's proposal and a composite force rebelling against that feeling. This latter force was made up of motives of respectability and good sense, of hostile feelings caused by the governess's disclosures (jealousy and wounded pride, as we shall see later), and of a neurotic element, namely, the tendency to a repudiation of sexuality which was already present in her and was based on her childhood history. Her love for her father, which she summoned up to protect her against the temptation, had its origin in this same childhood history.

Her intention of flying to her father, which, as we have seen, reached down into the unconscious, was transformed by the dream into a situation which presented as fulfilled the wish that her father should save her from the danger. In this process it was necessary to put on one side a certain thought which stood in the way; for it was her father himself who had brought her into the danger. The hostile feeling against her father (her desire for revenge), which was here suppressed, was, as we shall discover, one of the motive forces of the second dream.

According to the necessary conditions of dream-formation the imagined situation must be chosen so as to reproduce a situation in infancy. A special triumph is achieved if a recent situation, perhaps even the very situation which is the exciting cause of the dream, can be transformed into an infantile one. This has actually been achieved in the present case, by a purely chance disposition of the material. Just as Herr K. had stood beside her sofa and woken her up, so her father had often done in her childhood. The whole trend of her thoughts could be most aptly symbolized by her substitution of her father for Herr K. in that situation.

But the reason for which her father used to wake her up long ago had been to prevent her from making her bed wet.

This 'wet' had a decisive influence on the further content of the dream; though it was represented in it only by a distant allusion and by its opposite.

The opposite of 'wet' and 'water' can easily be 'fire' and 'burning'. The chance that, when they arrived at the place, her father had expressed his anxiety at the risk of fire, helped to decide that the danger from which her father was to rescue her should be a fire. The situation chosen for the dream-picture was based upon this chance, and upon the opposition to 'wet': 'There was a fire. Her father was standing beside her bed to wake her.' Her father's chance utterance would, no doubt, not have obtained such an important position in the dream if it had not fitted in so excellently with the dominating current of feeling, which was determined to regard him at any cost as a protector and saviour. 'He foresaw the danger from the very moment of our arrival! He was in the right!' (In actual fact, it was he who had brought the girl into danger.)

In consequence of certain connections which can easily be made from it, the word 'wet' served in the dream-thoughts as a nodal point between several groups of ideas. 'Wet' was connected not only with the bed-wetting, but also with the group of ideas relating to sexual temptation which lay suppressed behind the content of the dream. Dora knew that there was a kind of getting wet involved in sexual intercourse, and that during the act of copulation the man presented the woman with something liquid *in the form of drops*. She also knew that the danger lay precisely in that, and that it was her business to protect her genitals from being moistened.

'Wet' and 'drops' at the same time opened the way to the other group of associations - the group relating to the disgusting catarrh, which in her later years had no doubt possessed the same mortifying significance for her as the bed-wetting had in her childhood. 'Wet' in this connection had the same meaning as 'dirtied'. Her genitals, which ought to have been kept clean, had been dirtied already by the catarrh - and this applied to her mother no less than to herself (p. 1412). She seemed to understand that her mother's mania for cleanliness was a reaction against this dirtying.

The two groups of ideas met in this one thought: 'Mother got both things from father: the sexual wetness and the dirtying discharge.' Dora's jealousy of her mother was inseparable from the group of thoughts relating to her infantile love for her father which she summoned up for her protection. But this material was not yet capable of representation. If, however, a recollection could be found which was equally closely connected with both the groups related to the word 'wet', but which avoided any offensiveness, then such a recollection would be able to take over the representation in the dream of the material in question.

A recollection of this sort was furnished by the episode of the 'drops' - the jewellery ['*Schmuck*'] that Dora's mother wanted to have. In appearance the connection between this reminiscence and the two groups of thoughts relating to sexual wetness and to being dirtied was a purely external and superficial one, of a verbal character. For 'drops' was used ambiguously as a 'switch-word', while 'jewellery' ['*Schmuck*'] was taken as an equivalent to 'clean', and thus as a rather forced contrary of 'dirtied'.¹ But in reality the most substantial connections can be shown to have existed between the things denoted themselves. The recollection originated from the material connected with Dora's jealousy of her mother, which, though its roots were infantile, had persisted far beyond that period. By means of these two verbal bridges it was possible to transfer on to the single reminiscence of the 'jewel-drops' the whole of the significance attaching to the ideas of her parents' sexual intercourse, and of her mother's gonorrhoea and tormenting passion for cleanliness.

¹ [The German word '*Schmuck*' has a much wider meaning than the English 'jewellery', though that is the sense in which it occurs in the compound '*Schmuckkästchen*', 'jewel-case'. As a substantive, '*Schmuck*' denotes 'finery' of all kinds, not only personal adornments, but embellishments of objects and decorations in general. In an adjectival sense, it can mean 'smart', 'tidy', or 'neat'.]

But a still further displacement had to be effected before this material appeared in the dream. Though 'drops' is nearer to the original 'wet', it was the more distant 'jewellery' that found a place in the dream. When, therefore, this element had been inserted into the dream-situation which had already been established, the account might have run: 'Mother wanted to stop and save her jewellery.' But a subsequent influence now made itself felt, and led to the further alteration of 'jewellery' into 'jewel-case'. This influence came from elements in the underlying group relating to the temptation offered by Herr K. He had never given her jewellery, but he had given her a 'case' for it, which meant for her all the marks of preference and all the tenderness for which she felt she ought now to have been grateful. And the composite word thus formed, 'jewel-case', had beyond this a special claim to be used as a representative element in the dream. Is not 'jewel-case' [*Schmuckkästen*] a term commonly used to describe female genitals that are immaculate and intact? And is it not, on the other hand, an innocent word? Is it not, in short, admirably calculated both to betray and to conceal the sexual thoughts that lie behind the dream?

'Mother's jewel-case' was therefore introduced in two places in the dream; and this element replaced all mention of Dora's infantile jealousy, of the drops (that is, of the sexual wetness), of being dirtied by the discharge, and, on the other hand, of her present thoughts connected with the temptation - the thoughts which were urging her to reciprocate the man's love, and which depicted the sexual situation (alike desirable and menacing) that lay before her. The element of 'jewel-case' was more than any other a product of condensation and displacement, and a compromise between contrary mental currents. The multiplicity of its origin - both from infantile and contemporary sources - is no doubt pointed to by its double appearance in the content of the dream.

The dream was a reaction to a fresh experience of an exciting nature; and this experience must inevitably have revived the memory of the only previous experience which was at all analogous to it. The latter was the scene of the kiss in Herr K.'s place of business, when she had been seized with disgust. But this same scene was associatively accessible from other directions too, namely, from the group of thoughts relating to the catarrh (p. 83), and from her present temptation. The scene therefore brought to the dream a contribution of its own, which had to be made to fit in with the dream situation that had already been laid down: 'There was a fire' . . . no doubt the kiss smelt of smoke; so she smelt smoke in the dream, and the smell persisted till after she was awake.

By inadvertence, I unfortunately left a gap in the analysis of the dream. Dora's father was made to say, 'I refuse to let my two children go to their destruction . . .' ('as a result of masturbation' should no doubt be added from the dream-thoughts). Such speeches in dreams are regularly constructed out of pieces of actual speeches which have either been made or heard. I ought to have made enquiries as to the actual source of this speech. The results of my enquiry would no doubt have shown that the structure of the dream was still more complicated, but would at the same time have made it easier to penetrate.

Are we to suppose that when this dream occurred at L-- it had precisely the same content as when it recurred during the treatment? It does not seem necessary to do so. Experience shows that people often assert that they have had the same dream, when as a matter of fact the separate appearances of the recurrent dream have differed from one another in numerous details and in other respects that were of no small importance. Thus one of my patients told me that she had had her favourite dream again the night before, and that it always recurred in the same form: she had dreamed of swimming in the blue sea, of joyfully cleaving her way through the waves, and so on. On closer investigation it turned out that upon a common background now one detail and now another was brought out; on one occasion, even, she was swimming in a frozen sea and was surrounded by icebergs. This patient had other dreams, which turned out to be closely connected with the recurrent one, though even she made no attempt to claim that they were identical with it. Once, for instance, she was looking at a view of Heligoland (based on a photograph, but life-size) which showed the upper and lower parts of the island simultaneously; on the sea was a ship, in which were two people whom she had known in her youth, and so on.

What is certain is that in Dora's case the dream which occurred during the treatment had gained a new significance connected with the present time, though perhaps its manifest content had not changed. The dream-thoughts behind it included a reference to my treatment, and it corresponded to a renewal of the old intention of withdrawing from a danger. If her memory was not deceiving her when she declared that even at L-- she had noticed the smoke after she woke up, it must be acknowledged that she had brought my proverb, 'There can be no smoke without fire', very ingeniously into the completed form of the dream, in which it seemed to serve as an overdetermination of the last element. It was undeniably a mere matter of chance that the most recent exciting cause - her mother's locking the dining-room door so that her brother was shut into his bedroom - had provided a connection with her persecution by Herr K. at L--, where her decision had been made when she found she could not lock her bedroom door. It is possible that her brother did not appear in the dream on the earlier occasions, so that the words 'my two children' did not form part of its content until after the occurrence of its latest exciting cause.

III

THE SECOND DREAM

A few weeks after the first dream the second occurred, and when it had been dealt with the analysis was broken off. It cannot be made as completely intelligible as the first, but it afforded a desirable confirmation of an assumption which had become necessary about the patient's mental state, it filled up a gap in her memory, and it made it possible to obtain a deep insight into the origin of another of her symptoms.

Dora described the dream as follows: *'I was walking about in a town which I did not know. I saw streets and squares which were strange to me.'*¹ *I then came into a house where I lived, went to my room, and found a letter from Mother lying there. She wrote saying that as I had left home without my parents' knowledge she had not wished to write to me to say that Father was ill. "Now he is dead, and if you like² you can come." I then went to the station ["Bahnhof"] and asked about a hundred times: "Where is the station?" I always got the answer: "Five minutes." I then saw a thick wood before me which I went into, and there I asked a man whom I met. He said to me: "Two and a half hours more."³ He offered to accompany me. But I refused and went alone. I saw the station in front of me and could not reach it. At the same time I had the usual feeling of anxiety that one has in dreams when one cannot move forward. Then I was at home. I must have been travelling in the meantime, but I know nothing about that. I walked into the porter's lodge, and enquired for our flat. The maidservant opened the door to me and replied that Mother and the others were already at the cemetery ["Friedhof"].'*⁴

¹ To this she subsequently made an important addendum: *'I saw a monument in one of the squares.'*

² To this came the addendum: *'There was a question-mark after this word, thus: "like?"'*

³ In repeating the dream she said: *'Two hours.'*

⁴ In the next session Dora brought me two addenda to this: *'I saw myself particularly distinctly going up the stairs,'* and *'After she had answered I went to my room, but not the least sadly, and began reading a big book that lay on my writing-table.'*

It was not without some difficulty that the interpretation of this dream proceeded. In consequence of the peculiar circumstances in which the analysis was broken off - circumstances connected with the content of the dream - the whole of it was not cleared up. And for this reason, too, I am not equally certain at every point of the order in which my conclusions were reached. I will begin by mentioning the subject-matter with which the current analysis was dealing at the time when the dream intervened. For some time Dora herself had been raising a number of questions about the connection between some of her actions and the motives which presumably underlay them. One of these questions was: 'Why did I say nothing about the scene by the lake for some days after it had happened?' Her second question was: 'Why did I then suddenly tell my parents about it?' Moreover, her having felt so deeply injured by Herr K.'s proposal seemed to me in general to need explanation, especially as I was beginning to realize that Herr K. himself had not regarded his proposal to Dora as a mere frivolous attempt at seduction. I looked upon her having told her parents of the episode as an action which she had taken when she was already under the influence of a morbid craving for revenge. A normal girl, I am inclined to think, will deal with a situation of this kind by herself.

I shall present the material produced during the analysis of this dream in the somewhat haphazard order in which it recurs to my mind.

She was wandering about alone in a strange town and saw streets and squares. Dora assured me that it was certainly not B--, which I had first hit upon, but a town in which she had never been. It was natural to suggest that she might have seen some pictures or photographs and have taken the dream-pictures from them. After this remark of mine came the addendum about the monument in one of the squares and immediately afterwards her recognition of its source. At Christmas she had been sent an album from a German health-resort, containing views of the town; and the very day before the dream she had looked this out to show it to some relatives who were stopping with them. It had been put in a box for keeping pictures in, and she could not lay her hands on it at once. She had therefore said to her mother: '*Where is the box?*'.¹ One of the pictures was of a square with a monument in it. The present had been sent to her by a young engineer, with whom she had once had a passing acquaintance in the manufacturing town. The young man had accepted a post in Germany, so as to become sooner self-supporting; and he took every opportunity of reminding Dora of his existence. It was easy to guess that he intended to come forward as a suitor one day, when his position had improved. But that would take time, and it meant waiting.

¹ In the dream she said: '*Where is the station?*' The resemblance between the two questions led me to make an inference which I shall go into presently.

The wandering about in a strange town was overdetermined. It led back to one of the exciting causes from the day before. A young cousin of Dora's had come to stay with them for the holidays, and Dora had had to show him round Vienna. This cause was, it is true, a matter of complete indifference to her. But her cousin's visit reminded her of her own first brief visit to Dresden. On that occasion she had been a stranger and had wandered about, not failing, of course, to visit the famous picture gallery. Another cousin of hers, who was with them and knew Dresden, had wanted to act as a guide and take her round the gallery. *But she declined and went alone*, and stopped in front of the pictures that appealed to her. She remained *two hours* in front of the Sistine Madonna, rapt in silent admiration. When I asked her what had pleased her so much about the picture she could find no clear answer to make. At last she said: 'The Madonna.'

There could be no doubt that these associations really belonged to the material concerned in forming the dream. They included portions which reappeared in the dream unchanged ('she declined and went alone' and 'two hours'). I may remark at once that 'pictures' was a nodal point in the network of her dream-thoughts (the pictures in the album, the pictures at Dresden). I should also like to single out, with a view to subsequent investigation, the theme of the 'Madonna', of the virgin mother. But what was most evident was that in this first part of the dream she was identifying herself with a young man. This young man was wandering about in a strange place, he was striving to reach a goal, but he was being kept back, he needed patience and must wait. If in all this she had been thinking of the engineer, it would have been appropriate for the goal to have been the possession of a woman, of herself. But instead of this it was - a station. Nevertheless, the relation of the question in the dream to the question which had been put in real life allows us to substitute 'box' for 'station'. A box and a woman: the notions begin to agree better.

She asked quite a hundred times. . . . This led to another exciting cause of the dream, and this time to one that was less indifferent. On the previous evening they had had company, and afterwards her father had asked her to fetch him the brandy: he could not get to sleep unless he had taken some brandy. She had asked her mother for the key of the sideboard; but the latter had been deep in conversation, and had not answered her, until Dora had exclaimed with the exaggeration of impatience: 'I've asked you *a hundred times* already where the key is.' As a matter of fact, she had of course only repeated the question about *five times*.¹

'Where is the *key*?' seems to me to be the masculine counterpart to the question 'Where is the *box*?'² They are therefore questions referring to - the genitals.

Dora went on to say that during this same family gathering some one had toasted her father and had expressed the hope that he might continue to enjoy the best of health for many years to come, etc. At this a strange quiver passed over her father's tired face, and she had understood what thoughts he was having to keep down. Poor sick man! who could tell what span of life was still to be his?

This brings us to the *contents of the letter* in the dream. Her father was dead, and she had left home by her own choice. In connection with this letter I at once reminded Dora of the farewell letter which she had written to her parents or had at least composed for their benefit. This letter had been intended to give her father a fright, so that he should give up Frau K.; or at any rate to take revenge on him if he could not be induced to do that. We are here concerned with the subject of her death and of her father's death. (Cf. 'cemetery' later on in the dream.) Shall we be going astray if we suppose that the situation which formed the façade of the dream was a phantasy of revenge directed against her father? The feelings of pity for him which she remembered from the day before would be quite in keeping with this. According to the phantasy she had left home and gone among strangers, and her father's heart had broken with grief and with longing for her. Thus she would be revenged. She understood very clearly what it was that her father needed when he could not get to sleep without a drink of brandy.³ We will make a note of Dora's *craving for revenge* as a new element to be taken into account in any subsequent synthesis of her dream-thoughts.

¹ In the dream the number five occurs in the mention of the period of 'five minutes'. In my book on the interpretation of dreams I have given several examples of the way in which numbers occurring in the dream-thoughts are treated by dreams. We frequently find them torn out of their true context and inserted into a new one.

² See the first dream, p. 1403.

³ There can be no doubt that sexual satisfaction is the best soporific, just as sleeplessness is almost always the consequence of lack of satisfaction. Her father could not sleep because he was debarred from sexual intercourse with the woman he loved. (Compare in this connection the phrase discussed just below: 'I get nothing out of my wife.')

But the contents of the letter must be capable of further determination. What was the source of the words 'if you like'? It was at this point that the addendum of there having been a question-mark after the word 'like' occurred to Dora, and she then recognized these words as a quotation out of the letter from Frau K. which had contained the invitation to L--, the place by the lake. In that letter there had been a question-mark placed, in a most unusual fashion, in the very middle of a sentence, after the intercalated words 'if you would like to come'.

So here we were back again at the scene by the lake and at the problems connected with it. I asked Dora to describe the scene to me in detail. At first she produced little that was new. Herr K.'s exordium had been somewhat serious; but she had not let him finish what he had to say. No sooner had she grasped the purport of his words than she had slapped him in the face and hurried away. I enquired what his actual words had been. Dora could only remember one of his pleas: 'You know I get nothing out of my wife.'¹ In order to avoid meeting him again she had wanted to get back to L-- on foot, by walking round the lake, and *she had asked a man whom she met how far it was*. On his replying that it was '*Two and a half hours*', she had given up her intention and had after all gone back to the boat, which left soon afterwards. Herr K. had been there too and had come up to her and begged her to forgive him and not to mention the incident. But she had made no reply. - Yes. The *wood* in the dream had been just like the wood by the shore of the lake, the wood in which the scene she had just described once more had taken place. But she had seen precisely the same thick wood the day before, in a picture at the Secessionist exhibition. In the background of the picture there were *nymphs*.²

¹ These words will enable us to solve one of our problems.

² Here for the third time we come upon 'picture' (views of towns, the Dresden gallery), but in a much more significant connection. Because of what appears in the picture (the wood, the nymphs), the '*Bild*' ['picture'] is turned into a '*Weibsbild*' [literally, 'picture of a woman' - a somewhat derogatory expression for 'woman'].

At this point a certain suspicion of mine became a certainty. The use of '*Bahnhof*' ['station'; literally, 'railway-court']¹ and '*Friedhof*' ['cemetery'; literally, 'peace-court'] to represent the female genitals was striking enough in itself, but it also served to direct my awakened curiosity to the similarly formed '*Vorhof*' ['vestibulum'; literally, 'fore-court'] - an anatomical term for a particular region of the female genitals. This might have been no more than mistaken ingenuity. But now, with the addition of 'nymphs' visible in the background of a 'thick wood', no further doubts could be entertained. Here was a symbolic geography of sex! 'Nymphae', as is known to physicians though not to laymen (and even by the former the term is not very commonly used), is the name given to the labia minora, which lie in the background of the 'thick wood' of the pubic hair. But any one who employed such technical names as 'vestibulum' and 'nymphae' must have derived his knowledge from books, and not from popular ones either, but from anatomical text-books or from an encyclopaedia - the common refuge of youth when it is devoured by sexual curiosity. If this interpretation were correct, therefore, there lay concealed behind the first situation in the dream a phantasy of defloration, the phantasy of a man seeking to force an entrance into the female genitals.²

¹ Moreover, a 'station' is used for purposes of '*Verkehr*' ['traffic', intercourse', 'sexual intercourse']: this fact determines the psychical coating in a number of cases of railway phobia.

² The phantasy of defloration formed the second component of the situation. The emphasis upon the difficulty of getting forward and the anxiety felt in the dream indicated the stress which the dreamer was so ready to lay upon her virginity - a point alluded to in another place by means of the Sistine Madonna. These sexual thoughts gave an unconscious ground-colouring to the wishes (which were perhaps merely kept secret) concerned with the suitor who was waiting for her in Germany. We have already recognized the phantasy of revenge as the first component of the same situation in the dream. The two components do not coincide completely, but only in part. We shall subsequently come upon the traces of a third and still more important train of thought.

I informed Dora of the conclusions I had reached. The impression made upon her must have been forcible, for there immediately appeared a piece of the dream which had been forgotten: *she went calmly to her room, and began reading a big book that lay on her writing table.*¹ The emphasis here was upon the two details 'calmly' and 'big' in connection with 'book'. I asked whether the book was in encyclopaedia *format*, and she said it was. Now children never read about forbidden subjects in an encyclopaedia *calmly*. They do it in fear and trembling, with an uneasy look over their shoulder to see if some one may not be coming. Parents are very much in the way while reading of this kind is going on. But this uncomfortable situation had been radically improved, thanks to the dream's power of fulfilling wishes. Dora's father was dead, and the others had already gone to the cemetery. She might calmly read whatever she chose. Did not this mean that one of her motives for revenge was a revolt against her parents' constraint? If her father was dead she could read or love as she pleased.

At first she would not remember ever having read anything in an encyclopaedia; but she then admitted that a recollection of an occasion of the kind did occur to her, though it was of an innocent enough nature. At the time when the aunt she was so fond of had been so seriously ill and it had already been settled that Dora was to go to Vienna, a *letter* had come from another uncle, to say that they could not go to Vienna, as a boy of his, a cousin of Dora's therefore, had fallen dangerously ill with appendicitis. Dora had thereupon looked up in the encyclopaedia to see what the symptoms of appendicitis were. From what she had then read she still recollected the characteristic localization of the abdominal pain.

¹ On another occasion, instead of 'calmly' she said 'not the least sadly' (p. 1430 *n.*) - I can quote this dream as fresh evidence for the correctness of an assertion made in my *Interpretation of Dreams* (Chapter VII, Section A; p. 953) to the effect that those pieces of a dream which are at first forgotten and are only subsequently remembered are invariably the most important from the point of view of understanding the dream. In the same place I went on to the conclusion that the forgetting of dreams must also be explained as an effect of endopsychic resistance.

I then remembered that shortly after her aunt's death Dora had had an attack of what had been alleged to be appendicitis. Up till then I had not ventured to count that illness among her hysterical productions. She told me that during the first few days she had had high fever and had felt the pain in her abdomen that she had read about in the encyclopaedia. She had been given cold fomentations but had not been able to bear them. On the second day her period had set in, accompanied by violent pains. (Since her health had been bad, the periods had been very irregular.) At that time she used to suffer continually from constipation.

It was not really possible to regard this state as a purely hysterical one. Although hysterical fever does undoubtedly occur, yet it seemed too arbitrary to put down the fever accompanying this questionable illness to hysteria instead of to some organic cause operative at the time. I was on the point of abandoning the track, when she herself helped me along it by producing her last addendum to the dream: *she saw herself particularly distinctly going up the stairs.*

I naturally required a special determinant for this. Dora objected that she would anyhow have had to go upstairs if she had wanted to get to her flat, which was on an upper floor. It was easy to brush aside this objection (which was probably not very seriously intended) by pointing out that if she had been able to travel in her dream from the unknown town to Vienna without making a railway journey she ought also to have been able to leave out a flight of stairs. She then proceeded to relate that after the appendicitis she had not been able to walk properly and had dragged her right foot. This state of things had continued for a long time, and on that account she had been particularly glad to avoid stairs. Even now her foot sometimes dragged. The doctors whom she had consulted at her father's desire had been very much astonished at this most unusual after-effect of an appendicitis, especially as the abdominal pains had not recurred and did not in any way accompany the dragging of the foot.¹

¹ We must assume the existence of some somatic connection between the painful abdominal sensations known as 'ovarian neuralgia' and locomotor disturbances in the leg on the same side; and we must suppose that in Dora's case the somatic connection had been given an interpretation of a particularly specialized sort, that is to say, that it had been overlaid with and brought into the service of a particular psychological meaning. The reader is referred to my analogous remarks in connection with the analysis of Dora's symptom of coughing and with the relation between catarrh and loss of appetite.

Here, then, we have a true hysterical symptom. The fever may have been organically determined - perhaps by one of those very frequent attacks of influenza that are not localized in any particular part of the body. Nevertheless it was now established that the neurosis had seized upon this chance event and made use of it for an utterance of its own. Dora had therefore given herself an illness which she had read up about in the encyclopaedia, and she had punished herself for dipping into its pages. But she was forced to recognize that the punishment could not possibly apply to her reading the innocent article in question. It must have been inflicted as the result of a process of displacement, after another occasion of more guilty reading had become associated with this one; and the guilty occasion must lie concealed in her memory behind the contemporaneous innocent one.¹ It might still be possible, perhaps, to discover the nature of the subjects she had read about on that other occasion.

What, then, was the meaning of this condition, of this attempted simulation of a perityphlitis? The remainder of the disorder, the dragging of one leg, was entirely out of keeping with perityphlitis. It must, no doubt, fit in better with the secret and possibly sexual meaning of the clinical picture; and if it were elucidated might in its turn throw light on the meaning which we were in search of. I looked about for a method of approaching the puzzle. Periods of time had been mentioned in the dream; and time is assuredly never a matter of indifference in any biological event. I therefore asked Dora when this attack of appendicitis had taken place; whether it had been before or after the scene by the lake. Every difficulty was resolved at a single blow by her prompt reply: 'Nine months later.' The period of time is sufficiently characteristic. Her supposed attack of appendicitis had thus enabled the patient with the modest means at her disposal (the pains and the menstrual flow) to realize a phantasy of *childbirth*.² Dora was naturally aware of the significance of this period of time, and could not dispute the probability of her having, on the occasion under discussion, read up in the encyclopaedia about pregnancy and childbirth. But what was all this about her dragging her leg? I could now hazard a guess. That is how people walk when they have twisted a foot. So she had made a 'false step': which was true indeed if she could give birth to a child nine months after the scene by the lake. But there was still another requirement upon the fulfilment of which I had to insist. I am convinced that a symptom of this kind can only arise where it has an *infantile* prototype. All my experience hitherto has led me to hold firmly to the view that recollections derived from the impressions of later years do not possess sufficient force to enable them to establish themselves as symptoms. I scarcely dared hope that Dora would provide me with the material that I wanted from her childhood, for the fact is that I am not yet in a position to assert the general validity of this rule, much as I should like to be able to do so. But in this case there came an immediate confirmation of it. Yes, said Dora, once when she was a child she had twisted the same foot; she had slipped on one of the steps as she was going *downstairs*. The foot - and it was actually the same one that she afterwards dragged - had swelled up and had to be bandaged and she had had to lie up for some weeks. This had been a short time before the attack of nervous asthma in her eighth year.

¹ This is quite a typical example of the way in which symptoms arise from exciting causes which appear to be entirely unconnected with sexuality.

² I have already indicated that the majority of hysterical symptoms, when they have attained their full pitch of development, represent an imagined situation of sexual life - such as a scene of sexual intercourse, pregnancy, childbirth, confinement, etc.

The next thing to do was to turn to account our knowledge of the existence of this phantasy: 'If it is true that you were delivered of a child nine months after the scene by the lake, and that you are going about to this very day carrying the consequences of your false step with you, then it follows that in your unconscious you must have regretted the upshot of the scene. In your unconscious thoughts, that is to say, you have made an emendation in it. The assumption that underlies your phantasy of childbirth is that on that occasion something took place,¹ that on that occasion you experienced and went through everything that you were in fact obliged to pick up later on from the encyclopaedia. So you see that your love for Herr K. did not come to an end with the scene, but that (as I maintained) it has persisted down to the present day - though it is true that you are unconscious of it.' - And Dora disputed the fact no longer.²

¹ The phantasy of defloration is thus found to have an application to Herr K., and we begin to see why this part of the dream contained material taken from the scene by the lake - the refusal, two and a half hours, the wood, the invitation to L--.

² I may here add a few supplementary interpretations to those that have already been given: The '*Madonna*' was obviously Dora herself; in the first place because of the 'adorer' who had sent her the pictures, in the second place because she had won Herr K.'s love chiefly by the motherliness she had shown towards his children, and lastly because she had had a child though she was still a girl (this being a direct allusion to the phantasy of childbirth). Moreover, the notion of the '*Madonna*' is a favourite counter-idea in the mind of girls who feel themselves oppressed by imputations of sexual guilt, - which was the case with Dora. A first suspicion of this connection came to me while I was working as a physician at the Psychiatric Clinic of the University. I there came across a case of confusional insanity with hallucinations, in which the attack, which ran a rapid course, turned out to be a reaction to a reproach made against the patient by her *fiancé*. - If the analysis had been continued, Dora's maternal longing for a child would probably have been revealed as an obscure though powerful motive in her behaviour. The numerous questions which she had been raising latterly seem to have been belated derivatives of questions inspired by the sexual curiosity which she had tried to gratify with the encyclopaedia. The subjects which she read up in it were presumably pregnancy, childbirth, virginity, and so on. - In reproducing the dream Dora had forgotten one of the questions which need to be inserted into the course of the second situation in the dream. This question could only be; 'Does Herr -- live here?' or 'Where does Herr - live?' There must have been some reason for her having forgotten this apparently innocent question, especially as she need not have brought it into the dream at all. This reason, it seems to me, lay in her surname itself, which also denoted an object and in fact more than one kind of object, and which could therefore be regarded as an 'ambiguous' word. Unluckily I cannot give the name and show how well designed it was to indicate something 'ambiguous' and 'improper'. This interpretation was supported by the discovery of a similar play upon words in another part of the dream, where the material was derived from Dora's recollections of her aunt's death ('they have already gone to the cemetery') and where there was similarly a play upon her aunt's *name*. These improper words seemed to point to a second and *oral* source of information, since the encyclopaedia would not cover them. I should not have been surprised to hear that this source had been Frau K. herself, Dora's calumniator. In that case she would have been the one person whom Dora generously spared, while she pursued the others with an almost malignant vindictiveness. Behind the almost limitless series of displacements which were thus brought to light, it was possible to divine the operation of a single simple factor - Dora's deep-rooted homosexual love for Frau K.

The labour of elucidating the second dream had so far occupied two hours. At the end of the second session, when I expressed my satisfaction at the result, Dora replied in a depreciatory tone: 'Why, has anything so very remarkable come out?' These words prepared me for the advent of fresh revelations.

She opened the third session with these words: 'Do you know that I am here for the last time to-day?' - 'How can I know, as you have said nothing to me about it?' - 'Yes. I made up my mind to put up with it till the New Year.¹ But I shall wait no longer than that to be cured.' - 'You know that you are free to stop the treatment at any time. But for to-day we will go on with our work. When did you come to this decision?' - 'A fortnight ago, I think.' - 'That sounds just like a maidservant or a governess - a fortnight's notice.' - 'There was a governess who gave notice with the K.'s, when I was on my visit to them that time at L--, by the lake.' - 'Really? You have never told me about her. Tell me.'

'Well, there was a young girl in the house, who was the children's governess; and she behaved in the most extraordinary way to Herr K. She never said good morning to him, never answered his remarks, never handed him anything at table when he asked for it, and in short treated him like thin air. For that matter he was hardly any politer to her. A day or two before the scene by the lake, the girl took me aside and said she had something to tell me. She then told me that Herr K. had made advances to her at a time when his wife was away for several weeks; he had made violent love to her and had implored her to yield to his entreaties, saying that he got nothing from his wife, and so on.' - 'Why, those are the very words he used afterwards, when he made his proposal to you and you gave him the slap in his face'. - 'Yes. She had given way to him, but after a little while he had ceased to care for her, and since then she hated him.' - 'And this governess had given notice?' - 'No. She meant to give notice. She told me that as soon as she felt she was thrown over she had told her parents what had happened. They were respectable people living in Germany somewhere. Her parents said that she must leave the house instantly; and, as she failed to do so, they wrote to her saying that they would have nothing more to do with her, and that she was never to come home again.' - 'And why had she not gone away?' - 'She said she meant to wait a little longer, to see if there might not be some change in Herr K. She could not bear living like that any more, she said, and if she saw no change she should give notice and go away.' - 'And what became of the girl?' - 'I only know that she went away.' - 'And she did not have a child as a result of the adventure?' - 'No.'

¹ It was December 31st.

Here, therefore (and quite in accordance with the rules), was a piece of material information coming to light in the middle of the analysis and helping to solve problems which had previously been raised. I was able to say to Dora: 'Now I know your motive for the slap in the face with which you answered Herr K.'s proposal. It was not that you were offended at his suggestions; you were actuated by jealousy and revenge. At the time when the governess was telling you her story you were still able to make use of your gift for putting on one side everything that is not agreeable to your feelings. But at the moment when Herr K. used the words "I get nothing out of my wife" - which were the same words he had used to the governess - fresh emotions were aroused in you and tipped the balance. "Does he dare", you said to yourself, "to treat me like a governess, like a servant?" Wounded pride added to jealousy and to the conscious motives of common sense - it was too much.¹ To prove to you how deeply impressed you were by the governess's story, let me draw your attention to the repeated occasions upon which you have identified yourself with her both in your dream and in your conduct. You told your parents what happened - a fact which we have hitherto been unable to account for - just as the governess wrote and told *her* parents. You give me a fortnight's notice, just like a governess. The letter in the dream which gave you leave to go home is the counterpart of the governess's letter from her parents forbidding her to do so.'

¹ It is not a matter of indifference, perhaps, that Dora may have heard her father make the same complaint about his wife, just as I myself did from his own lips. She was perfectly well aware of its meaning.

'Then why did I not tell my parents at once?'

'How much time did you allow to elapse?'

'The scene took place on the last day of June; I told my mother about it on July 14th.'

'Again a fortnight, then - the time characteristic for a person in service. Now I can answer your question. You understood the poor girl very well. She did not want to go away at once, because she still had hopes, because she expected that Herr K.'s affections would return to her again. So that must have been your motive too. You waited for that length of time so as to see whether he would repeat his proposals; if he had, you would have concluded that he was in earnest, and did not mean to play with you as he had done with the governess.'

'A few days after I had left he sent me a picture post-card.'¹

'Yes, but when after that nothing more came, you gave free rein to your feelings of revenge. I can even imagine that at that time you were still able to find room for a subsidiary intention, and thought that your accusation might be a means of inducing him to travel to the place where you were living. - 'As he actually offered to do at first,' Dora threw in. - 'In that way your longing for him would have been appeased' - here she nodded assent, a thing which I had not expected - 'and he might have made you the amends you desired.'

'What amends?'

'The fact is, I am beginning to suspect that you took the affair with Herr K. much more seriously than you have been willing to admit so far. Had not the K.'s often talked of getting a divorce?'

'Yes, certainly. At first she did not want to, on account of the children. And now she wants to, but he no longer does.'

¹ Here is the point of contact with the engineer, who was concealed behind the figure of Dora herself in the first situation in the dream.

'May you not have thought that he wanted to get divorced from his wife so as to marry you? And that now he no longer wants to because he has no one to replace her? It is true that two years ago you were very young. But you told me yourself that your mother was engaged at seventeen and then waited two years for her husband. A daughter usually takes her mother's love-story as her model. So you too wanted to wait for him, and you took it that he was only waiting till you were grown up enough to be his wife.¹ I imagine that this was a perfectly serious plan for the future in your eyes. You have not even got the right to assert that it was out of the question for Herr K. to have had any such intention; you have told me enough about him that points directly towards his having such an intention.² Nor does his behaviour at L-- contradict this view. After all, you did not let him finish his speech and do not know what he meant to say to you. Incidentally, the scheme would by no means have been so impracticable. Your father's relations with Frau K.- and it was probably only for this reason that you lent them your support for so long - made it certain that her consent to a divorce could be obtained; and you can get anything you like out of your father. Indeed, if your temptation at L-- had had a different upshot, this would have been the only possible solution for all the parties concerned. And I think that is why you regretted the actual event so deeply and emended it in the phantasy which made its appearance in the shape of the appendicitis. So it must have been a bitter piece of disillusionment for you when the effect of your charges against Herr K. was not that he renewed his proposals but that he replied instead with denials and slanders. You will agree that nothing makes you so angry as having it thought that you merely fancied the scene by the lake. I know now - and this is what you do not want to be reminded of - that you *did* fancy that Herr K.'s proposals were serious, and that he would not leave off until you had married him.'

¹ The theme of waiting till the goal is reached occurs in the content of the first situation in the dream. I recognize in this phantasy of waiting for a fiancée a portion of the third component of that situation. I have already alluded to the existence of this third component.

² In particular there was a speech which he had made in presenting Dora with a letter-case for Christmas in the last year in which they lived together at B.

Dora had listened to me without any of her usual contradictions. She seemed to be moved; she said good-bye to me very warmly, with the heartiest wishes for the New Year, and - came no more. Her father, who called on me two or three times afterwards, assured me that she would come back again, and said it was easy to see that she was eager for the treatment to continue. But it must be confessed that Dora's father was never entirely straightforward. He had given his support to the treatment so long as he could hope that I should 'talk' Dora out of her belief that there was something more than a friendship between him and Frau K. His interest faded when he observed that it was not my intention to bring about that result. I knew Dora would not come back again. Her breaking off so unexpectedly, just when my hopes of a successful termination of the treatment were at their highest, and her thus bringing those hopes to nothing - this was an unmistakable act of vengeance on her part. Her purpose of self-injury also profited by this action. No one who, like me, conjures up the most evil of those half-tamed demons that inhabit the human breast, and seeks to wrestle with them, can expect to come through the struggle unscathed. Might I perhaps have kept the girl under my treatment if I myself had acted a part, if I had exaggerated the importance to me of her staying on, and had shown a warm personal interest in her - a course which, even after allowing for my position as her physician, would have been tantamount to providing her with a substitute for the affection she longed for? I do not know. Since in every case a portion of the factors that are encountered under the form of resistance remains unknown, I have always avoided acting a part, and have contented myself with practising the humbler arts of psychology. In spite of every theoretical interest and of every endeavour to be of assistance as a physician, I keep the fact in mind that there must be some limits set to the extent to which psychological influence may be used, and I respect as one of these limits the patient's own will and understanding.

Nor do I know whether Herr K. would have done any better if it had been revealed to him that the slap Dora gave him by no means signified a final 'No' on her part, but that it expressed the jealousy which had lately been roused in her, while her strongest feelings were still on his side. If he had disregarded that first 'No', and had continued to press his suit with a passion which left room for no doubts, the result might very well have been a triumph of the girl's affection for him over all her internal difficulties. But I think she might just as well have been merely provoked into satisfying her craving for revenge upon him all the more thoroughly. It is never possible to calculate towards which side the decision will incline in such a conflict of motives: whether towards the removal of the repression or towards its reinforcement. Incapacity for meeting a *real* erotic demand is one of the most essential features of a neurosis. Neurotics are dominated by the opposition between reality and phantasy. If what they long for the most intensely in their phantasies is presented to them in reality, they none the less flee from it; and they abandon themselves to their phantasies the most readily where they need no longer fear to see them realized. Nevertheless, the barrier erected by repression can fall before the onslaught of a violent emotional excitement produced by a real cause; it is possible for a neurosis to be overcome by reality. But we have no general means of calculating through what person or what event such a cure can be effected.¹

¹ I will add a few remarks on the structure of this dream, though it is not possible to understand it thoroughly enough to allow of a synthesis being attempted. A prominent piece of the dream is to be seen in the phantasy of revenge against her father, which stands out like a façade in front of the rest. (She had gone away from home by her own choice; her father was ill, and then dead. . . Then she went home; all the others were already at the cemetery. She went to her room, not the least sadly, and calmly began reading the encyclopaedia.) This part of the material also contained two allusions to her other act of revenge, which she had actually carried out, when she let her parents discover a farewell letter from her. (The letter - from her mother, in the dream and the mention of the funeral of the aunt who had always been her model.) Behind this phantasy lie concealed her thoughts of revenge against Herr K., for which she found an outlet in her behaviour to me. (The maid-servant, the invitation, the wood, the two and a half hours - all these came from material connected with the events at L---.) Her recollection of the governess, and of the latter's exchange of letters with her parents, is related, no less than her farewell letter, to the letter in the dream allowing her to come home. Her refusal to let herself be accompanied and her decision to go alone may perhaps be translated into these words: 'Since you have treated me like a servant, I shall take no more notice of you, I shall go my own way by myself, and not marry.' - Screened by these thoughts of revenge, glimpses can be caught in other places of material derived from tender phantasies based upon the love for Herr K. which still persisted unconsciously in Dora. ('I would have waited for you till I could be your wife' - defloration - childbirth.) - Finally, we can see the action of the fourth and most deeply buried group of thoughts - those relating to her love for Frau K. - in the fact that the phantasy of defloration is represented from the man's point of view (her identification of herself with her admirer who lived abroad) and in the fact that in two places there are the clearest allusions to ambiguous speeches ('Does Herr -- live here?') and to that source of her sexual knowledge which had not been oral (the encyclopaedia). - Cruel and sadistic tendencies find satisfaction in this dream.

IV

POSTSCRIPT

It is true that I have introduced this paper as a fragment of an analysis; but the reader will have discovered that it is incomplete to a far greater degree than its title might have led him to expect. It is therefore only proper that I should attempt to give a reason for the omissions - which are by no means accidental.

A number of the results of the analysis have been omitted, because at the time when work was broken off they had either not been established with sufficient certainty or they required further study before any general statement could be made about them. At other points, where it seemed to be permissible, I have indicated the direction along which some particular solution would probably have been found to lie. I have in this paper left entirely out of account the technique, which does not at all follow as a matter of course, but by whose means alone the pure metal of valuable unconscious thoughts can be extracted from the raw material of the patient's associations. This brings with it the disadvantage of the reader being given no opportunity of testing the correctness of my procedure in the course of this exposition of the case. I found it quite impracticable, however, to deal simultaneously with the technique of analysis and with the internal structure of a case of hysteria: I could scarcely have accomplished such a task, and if I had, the result would have been almost unreadable. The technique of analysis demands an entirely separate exposition, which would have to be illustrated by numerous examples chosen from a very great variety of cases and which would not have to take the results obtained in each particular case into account. Nor have I attempted in this paper to substantiate the psychological postulates which will be seen to underlie my descriptions of mental phenomena. A cursory attempt to do so would have effected nothing; an exhaustive one would have been a volume in itself. I can only assure the reader that I approached the study of the phenomena revealed by observation of the psychoneuroses without being pledged to any particular psychological system, and that I then proceeded to adjust my views until they seemed adapted for giving an account of the collection of facts which had been observed. I take no pride in having avoided speculation; the material for my hypotheses was collected by the most extensive and laborious series of observations. The decidedness of my attitude on the subject of the unconscious is perhaps specially likely to cause offence, for I handle unconscious ideas, unconscious trains of thought, and unconscious impulses as though they were no less valid and unimpeachable psychological data than conscious ones. But of this I am certain - that any one who sets out to investigate the same region of phenomena and employs the same method will find himself compelled to take up the same position, however much philosophers may expostulate.

Some of my medical colleagues have looked upon my theory of hysteria as a purely psychological one, and have for that reason pronounced it *ipso facto* incapable of solving a pathological problem. They may perhaps discover from this paper that their objection was based upon their having unjustifiably transferred what is a characteristic of the technique on to the theory itself. It is the therapeutic technique alone that is purely psychological; the theory does not by any means fail to point out that neuroses have an organic basis - though it is true that it does not look for that basis in any pathological anatomical changes, and provisionally substitutes the conception of organic functions for the chemical changes which we should expect to find but which we are at present unable to apprehend. No one, probably, will be inclined to deny the sexual function the character of an organic factor, and it is the sexual function that I look upon as the foundation of hysteria and of the psychoneuroses in general. No theory of sexual life will, I suspect, be able to avoid assuming the existence of some definite sexual substances having an excitant action. Indeed, of all the clinical pictures which we meet with in clinical medicine, it is the phenomena of intoxication and abstinence in connection with the use of certain chronic poisons that most closely resemble the genuine psychoneuroses.

But, once again, in the present paper I have not gone fully into all that might be said to-day about 'somatic compliance', about the infantile germs of perversion, about the erotogenic zones, and about our predisposition towards bisexuality; I have merely drawn attention to the points at which the analysis comes into contact with these organic bases of the symptoms. More than this could not be done with a single case. And I had the same reasons that I have already mentioned for wishing to avoid a cursory discussion of these factors. There is a rich opportunity here for further works, based upon the study of a large number of analyses.

Nevertheless, in publishing this paper, incomplete though it is, I had two objects in view. In the first place, I wished to supplement my book on the interpretation of dreams by showing how an art, which would otherwise be useless, can be turned to account for the discovery of the hidden and repressed parts of mental life. (Incidentally, in the process of analysing the two dreams dealt with in the paper, the technique of dream-interpretation, which is similar to that of psycho-analysis, has come under consideration.) In the second place, I wished to stimulate interest in a whole group of phenomena of which science is still in complete ignorance to-day because they can only be brought to light by the use of this particular method. No one, I believe, can have had any true conception of the complexity of the psychological events in a case of hysteria - the juxtaposition of the most dissimilar tendencies, the mutual dependence of contrary ideas, the repressions and displacements, and so on. The emphasis laid by Janet upon the '*idée fixe*' which becomes transformed into a symptom amounts to no more than an extremely meagre attempt at schematization. Moreover, it is impossible to avoid the suspicion that, when the ideas attaching to certain excitations are incapable of becoming conscious, those excitations must act upon one another differently, run a different course, and manifest themselves differently from those other excitations which we describe as 'normal' and which have ideas attaching to them of which we become conscious. When once things have been made clear up to this point, no obstacle can remain in the way of an understanding of a therapeutic method which removes neurotic symptoms by transforming ideas of the former kind into normal ones.

I was further anxious to show that sexuality does not simply intervene, like a *deus ex machina*, on one single occasion, at some point in the working of the processes which characterize hysteria, but that it provides the motive power for every single symptom, and for every single manifestation of a symptom. The symptoms of the disease are nothing else than *the patient's sexual activity*. A single case can never be capable of proving a theorem so general as this one; but I can only repeat over and over again - for I never find it otherwise - that sexuality is the key to the problem of the psychoneuroses and of the neuroses in general. No one who disdains the key will ever be able to unlock the door. I still await news of the investigations which are to make it possible to contradict this theorem or to limit its scope. What I have hitherto heard against it have been expressions of personal dislike or disbelief. To these it is enough to reply in the words of Charcot: 'Ça n'empêche pas d'exister.'

Nor is the case of whose history and treatment I have published a fragment in these pages well calculated to put the value of psycho-analytic therapy in its true light. Not only the briefness of the treatment (which hardly lasted three months) but another factor inherent in the nature of the case prevented results being brought about such as are attainable in other instances, where the improvement will be admitted by the patient and his relatives and will approximate more or less closely to a complete recovery. Satisfactory results of this kind are reached when the symptoms are maintained solely by the internal conflict between the impulses concerned with sexuality. In such cases the patient's condition will be seen improving in proportion as he is helped towards a solution of his mental problems by the translation of pathogenic into normal material. The course of events is very different when the symptoms have become enlisted in the service of external motives, as had happened with Dora during the two preceding years. It is surprising, and might easily be misleading, to find that the patient's condition shows no noticeable alteration even though considerable progress has been made with the work of analysis. But in reality things are not as bad as they seem. It is true that the symptoms do not disappear while the work is proceeding; but they disappear a little while later, when the relations between patient and physician have been dissolved. The postponement of recovery or improvement is really only caused by the physician's own person.

I must go back a little, in order to make the matter intelligible. It may be safely said that during psycho-analytic treatment the formation of new symptoms is invariably stopped. But the productive powers of the neurosis are by no means extinguished; they are occupied in the creation of a special class of mental structures, for the most part unconscious, to which the name of '*transferences*' may be given.

What are transferences? They are new editions or facsimiles of the impulses and phantasies which are aroused and made conscious during the progress of the analysis; but they have this peculiarity, which is characteristic for their species, that they replace some earlier person by the person of the physician. To put it another way: a whole series of psychological experiences are revived, not as belonging to the past, but as applying to the person of the physician at the present moment. Some of these transferences have a content which differs from that of their model in no respect whatever except for the substitution. These then - to keep to the same metaphor - are merely new impressions or reprints. Others are more ingeniously constructed; their content has been subjected to a moderating influence - to *sublimation*, as I call it - and they may even become conscious, by cleverly taking advantage of some real peculiarity in the physician's person or circumstances and attaching themselves to that. These, then, will no longer be new impressions, but revised editions.

If the theory of analytic technique is gone into, it becomes evident that transference is an inevitable necessity. Practical experience, at all events, shows conclusively that there is no means of avoiding it, and that this latest creation of the disease must be combated like all the earlier ones. This happens, however, to be by far the hardest part of the whole task. It is easy to learn how to interpret dreams, to extract from the patient's associations his unconscious thoughts and memories, and to practise similar explanatory arts: for these the patient himself will always provide the text. Transference is the one thing the presence of which has to be detected almost without assistance and with only the slightest clues to go upon, while at the same time the risk of making arbitrary inferences has to be avoided. Nevertheless, transference cannot be evaded, since use is made of it in setting up all the obstacles that make the material inaccessible to treatment, and since it is only after the transference has been resolved that a patient arrives at a sense of conviction of the validity of the connections which have been constructed during the analysis.

Some people may feel inclined to look upon it as a serious objection to a method which is in any case troublesome enough that it itself should multiply the labours of the physician by creating a new species of pathological mental products. They may even be tempted to infer from the existence of transferences that the patient will be injured by analytic treatment. Both these suppositions would be mistaken. The physician's labours are not multiplied by transference; it need make no difference to him whether he has to overcome any particular impulse of the patient's in connection with himself or with some one else. Nor does the treatment force upon the patient, in the shape of transference, any new task which he would not otherwise have performed. It is true that neuroses may be cured in institutions from which psycho-analytic treatment is excluded, that hysteria may be said to be cured not by the method but by the physician, and that there is usually a sort of blind dependence and a permanent bond between a patient and the physician who has removed his symptoms by hypnotic suggestion; but the scientific explanation of all these facts is to be found in the existence of 'transferences' such as are regularly directed by patients on to their physicians. Psycho-analytic treatment does not *create* transferences, it merely brings them to light, like so many other hidden psychical factors. The only difference is this - that spontaneously a patient will only call up affectionate and friendly transferences to help towards his recovery; if they cannot be called up, he feels the physician is 'antipathetic' to him, and breaks away from him as fast as possible and without having been influenced by him. In psycho-analysis, on the other hand, since the play of motives is different, all the patient's tendencies, including hostile ones, are aroused; they are then turned to account for the purposes of the analysis by being made conscious, and in this way the transference is constantly being destroyed. Transference, which seems ordained to be the greatest obstacle to psycho-analysis, becomes its most powerful ally, if its presence can be detected each time and explained to the patient.¹

¹ [Footnote added 1923:] A continuation of these remarks upon transference is contained in my technical paper on 'transference-love' (Freud, 1915a).

I have been obliged to speak of transference, for it is only by means of this factor that I can elucidate the peculiarities of Dora's analysis. Its great merit, namely, the unusual clarity which makes it seem so suitable as a first introductory publication, is closely bound up with its great defect, which led to its being broken off prematurely. I did not succeed in mastering the transference in good time. Owing to the readiness with which Dora put one part of the pathogenic material at my disposal during the treatment, I neglected the precaution of looking out for the first signs of transference, which was being prepared in connection with another part of the same material a part of which I was in ignorance. At the beginning it was clear that I was replacing her father in her imagination, which was not unlikely, in view of the difference between our ages. She was even constantly comparing me with him consciously, and kept anxiously trying to make sure whether I was being quite straightforward with her, for her father 'always preferred secrecy and roundabout ways'. But when the first dream came, in which she gave herself the warning that she had better leave my treatment just as she had formerly left Herr K.'s house, I ought to have listened to the warning myself. 'Now,' I ought to have said to her, 'it is from Herr K. that you have made a transference on to me. Have you noticed anything that leads you to suspect me of evil intentions similar (whether openly or in some sublimated form) to Herr K.'s? Or have you been struck by anything about me or got to know anything about me which has caught your fancy, as happened previously with Herr K.' Her attention would then have been turned to some detail in our relations, or in my person or circumstances, behind which there lay concealed something analogous but immeasurably more important concerning Herr K. And when this transference had been cleared up, the analysis would have obtained access to new memories, dealing, probably, with actual events. But I was deaf to this first note of warning, thinking I had ample time before me, since no further stages of transference developed and the material for the analysis had not yet run dry. In this way the transference took me unawares, and, because of the unknown quantity in me which reminded Dora of Herr K., she took her revenge on me as she wanted to take her revenge on him, and deserted me as she believed herself to have been deceived and deserted by him. Thus she *acted out* an essential part of her recollections and phantasies instead of reproducing it in the treatment. What this unknown quantity was I naturally cannot tell. I suspect that it had to do with money, or with jealousy of another patient who had kept up relations with my family after her recovery. When it is possible to work transferences into the analysis at an early stage, the course of the analysis is retarded and obscured, but its existence is better guaranteed against sudden and overwhelming resistances.

In Dora's second dream there are several clear allusions to transference. At the time she was telling me the dream I was still unaware (and did not learn until two days later) that we had only *two hours* more work before us. This was the same length of time which she had spent in front of the Sistine Madonna, and which (by making a correction and putting 'two hours' instead of 'two and a half hours') she had taken as the length of the walk which she had not made round the lake. The striving and waiting in the dream, which related to the young man in Germany, and had their origin in her waiting till Herr K. could marry her, had been expressed in the transference a few days before. The treatment, she had thought, was too long for her; she would never have the patience to wait so long. And yet in the first few weeks she had had discernment enough to listen without making any such objections when I informed her that her complete recovery would require perhaps a year. Her refusing in the dream to be accompanied, and preferring to go alone, also originated from her visit to the gallery at Dresden, and I was myself to experience them on the appointed day. What they meant was, no doubt: 'Men are all so detestable that I would rather not marry. This is my revenge.'¹

¹ The longer the interval of time that separates me from the end of this analysis, the more probable it seems to me that the fault in my technique lay in this omission: I failed to discover in time and to inform the patient that her homosexual (gynaecophilic) love for Frau K. was the strongest unconscious current in her mental life. I ought to have guessed that the main source of her knowledge of sexual matters could have been no one but Frau K. - the very person who later on charged her with being interested in those same subjects. Her knowing all about such things and, at the same time, her always pretending not to know where her knowledge came from was really too remarkable. I ought to have attacked this riddle and looked for the motive of such an extraordinary piece of repression. If I had done this, the second dream would have given me my answer. The remorseless craving for revenge expressed in that dream was suited as nothing else was to conceal the current of feeling that ran contrary to it - the magnanimity with which she forgave the treachery of the friend she loved and concealed from every one the fact that it was this friend who had herself revealed to her the knowledge which had later been the ground of the accusations against her. Before I had learnt the importance of the homosexual current of feeling in psychoneurotics, I was often brought to a standstill in the treatment of my cases or found myself in complete perplexity.

If cruel impulses and revengeful motives, which have already been used in the patient's ordinary life for maintaining her symptoms, become transferred on to the physician during treatment, before he has had time to detach them from himself by tracing them back to their sources, then it is not to be wondered at if the patient's condition is unaffected by his therapeutic efforts. For how could the patient take a more effective revenge than by demonstrating upon her own person the helplessness and incapacity of the physician? Nevertheless, I am not inclined to put too low a value on the therapeutic results even of such a fragmentary treatment as Dora's.

It was not until fifteen months after the case was over and this paper composed that I had news of my patient's condition and the effects of my treatment. On a date which is not a matter of complete indifference, on the first of April (times and dates, as we know, were never without significance for her), Dora came to see me again: to finish her story and to ask for help once more. One glance at her face, however, was enough to tell me that she was not in earnest over her request. For four or five weeks after stopping the treatment she had been 'all in a muddle', as she said. A great improvement had then set in; her attacks had become less frequent and her spirits had risen. In the May of that year one of the K.'s two children (it had always been delicate) had died. She took the opportunity of their loss to pay them a visit of condolence, and they received her as though nothing had happened in the last three years. She made it up with them, she took her revenge on them and she brought her own business to a satisfactory conclusion. To the wife she said: 'I know you have an affair with my father'; and the other did not deny it. From the husband she drew an admission of the scene by the lake which he had disputed, and brought the news of her vindication home to her father. Since then she had not resumed her relations with the family.

After this she had gone on quite well till the middle of October, when she had had another attack of aphonia which had lasted for six weeks. I was surprised at this news, and, on my asking her whether there had been any exciting cause, she told me that the attack had followed upon a violent fright. She had seen some one run over by a carriage. Finally she came out with the fact that the accident had occurred to no less a person than Herr K. himself. She had come across him in the street one day; they had met in a place where there was a great deal of traffic; he had stopped in front of her as though in bewilderment, and in his abstraction he had allowed himself to be knocked down by a carriage.¹ She had been able to convince herself, however, that he escaped without serious injury. She still felt some slight emotion if she heard any one speak of her father's affair with Frau K., but otherwise she had no further concern with the matter. She was absorbed in her work, and had no thoughts of marrying.

She went on to tell me that she had come for help on account of a right-sided facial neuralgia, from which she was now suffering day and night. 'How long has it been going on?' 'Exactly a fortnight.'² I could not help smiling; for I was able to show her that exactly a fortnight earlier she had read a piece of news that concerned me in the newspaper. (This was in 1902.) And this she confirmed.

¹ We have here an interesting contribution to the problem of indirect attempts at suicide, which I have discussed in my *Psychopathology of Everyday Life*.

² For the significance of this period of time and its relation to the theme of revenge, see the analysis of the second dream.

Her alleged facial neuralgia was thus a self-punishment - remorse at having once given Herr K. a box on the ear, and at having transferred her feelings of revenge on to me. I do not know what kind of help she wanted from me, but I promised to forgive her for having deprived me of the satisfaction of affording her a far more radical cure for her troubles.

Years have again gone by since her visit. In the meantime the girl has married, and indeed - unless all the signs mislead me - she has married the young man who came into her associations at the beginning of the analysis of the second dream. Just as the first dream represented her turning away from the man she loved to her father - that is to say, her flight from life into disease - so the second dream announced that she was about to tear herself free from her father and had been reclaimed once more by the realities of life.

THREE ESSAYS ON THE THEORY OF SEXUALITY
(1905)

Intentionally left blank

PREFACE TO THE SECOND EDITION

The author is under no illusion as to the deficiencies and obscurities of this little work. Nevertheless he has resisted the temptation of introducing into it the results of the researches of the last five years, since this would have destroyed its unity and documentary character. He is, therefore, reprinting the original text with only slight alterations, and has contented himself with adding a few footnotes which are distinguished from the older ones by an asterisk.¹ It is, moreover, his earnest wish that the book may age rapidly - that what was once new in it may become generally accepted, and that what is imperfect in it may be replaced by something better.

VIENNA, *December* 1909

¹ [The distinction was dropped in all subsequent editions.]

PREFACE TO THE THIRD EDITION

I have now been watching for more than ten years the effects produced by this work and the reception accorded to it; and I take the opportunity offered by the publication of its third edition to preface it with a few remarks intended to prevent misunderstandings and expectations that cannot be fulfilled. It must above all be emphasized that the exposition to be found in the following pages is based entirely upon everyday medical observation, to which the findings of psycho-analytic research should lend additional depth and scientific significance. It is impossible that these *Three Essays on the Theory of Sexuality* should contain anything but what psycho-analysis makes it necessary to assume or possible to establish. It is, therefore, out of the question that they could ever be extended into a complete 'theory of sexuality', and it is natural that there should be a number of important problems of sexual life with which they do not deal at all. But the reader should not conclude from this that the branches of this large subject which have been thus passed over are unknown to the author or have been neglected by him as of small importance.

The fact that this book is based upon the psycho-analytic observations which led to its composition is shown, however, not only in the choice of the topics dealt with, but also in their arrangement. Throughout the entire work the various factors are placed in a particular order of precedence: preference is given to the accidental factors while disposition is left in the background, and more weight is attached to ontogenesis than to phylogenesis. For it is the accidental factors that play the principal part in analysis: they are almost entirely subject to its influence. The dispositional ones only come to light after them, as something stirred into activity by experience: adequate consideration of them would lead far beyond the sphere of psycho-analysis.

The relation between ontogenesis and phylogenesis is a similar one. Ontogenesis may be regarded as a recapitulation of phylogenesis, in so far as the latter has not been modified by more recent experience. The phylogenetic disposition can be seen at work behind the ontogenetic process. But disposition is ultimately the precipitate of earlier experience of the species to which the more recent experience of the individual, as the sum of the accidental factors, is super-added.

I must, however, emphasize that the present work is characterized not only by being completely based upon psycho-analytic research, but also by being deliberately independent of the findings of biology. I have carefully avoided introducing my preconceptions, whether derived from general sexual biology or from that of particular animal species, into this study - a study which is concerned with the sexual functions of human beings and which is made possible through the technique of psycho-analysis. Indeed, my aim has rather been to discover how far psychological investigation can throw light upon the biology of the sexual life of man. It was legitimate for me to indicate points of contact and agreement which came to light during my investigation, but there was no need for me to be diverted from my course if the psycho-analytic method led in a number of important respects to opinions and findings which differed largely from those based on biological considerations.

In this third edition I have introduced a considerable amount of fresh matter, but have not indicated it in any special way, as I did in the previous edition. Progress in our field of scientific work is at present less rapid; nevertheless it was essential to make a certain number of additions to this volume if it was to be kept in touch with recent psycho-analytic literature.

VIENNA, *October* 1914

PREFACE TO THE FOURTH EDITION

Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psycho-analytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psycho-analysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psycho-analysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

Nevertheless I cannot bring myself to accept the idea that this part of psycho-analytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation of this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psycho-analysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.

It must also be remembered, however, that some of what this book contains - its insistence on the importance of sexuality in all human achievements and the attempt that it makes at enlarging the concept of sexuality - has from the first provided the strongest motives for the resistance against psycho-analysis. People have gone so far in their search for high-sounding catch words as to talk of the 'pan-sexualism' of psycho-analysis and to raise the senseless charge against it of explaining 'everything' by sex. We might be astonished at this, if we ourselves could forget the way in which emotional factors make people confused and forgetful. For it is some time since Arthur Schopenhauer, the philosopher, showed mankind the extent to which their activities are determined by sexual impulses - in the ordinary sense of the word. It should surely have been impossible for a whole world of readers to banish such a startling piece of information so completely from their minds. And as for the 'stretching' of the concept of sexuality which has been necessitated by the analysis of children and what are called perverts, anyone who looks down with contempt upon psycho-analysis from a superior vantage-point should remember how closely the enlarged sexuality of psycho-analysis coincides with the Eros of the divine Plato. (Cf. Nachmansohn, 1915.)

VIENNA, *May* 1920

THREE ESSAYS ON THE THEORY OF SEXUALITY

I

THE SEXUAL ABERRATIONS¹

The fact of the existence of sexual needs in human beings and animals is expressed in biology by the assumption of a 'sexual instinct', on the analogy of the instinct of nutrition, that is of hunger. Everyday language possesses no counterpart to the word 'hunger', but science makes use of the word 'libido' for that purpose.²

Popular opinion has quite definite ideas about the nature and characteristics of this sexual instinct. It is generally understood to be absent in childhood, to set in at the time of puberty in connection with the process of coming to maturity and to be revealed in the manifestations of an irresistible attraction exercised by one sex upon the other; while its aim is presumed to be sexual union, or at all events actions leading in that direction. We have every reason to believe, however, that these views give a very false picture of the true situation. If we look into them more closely we shall find that they contain a number of errors, inaccuracies and hasty conclusions flaws.

I shall at this point introduce two technical terms. Let us call the person from whom sexual attraction proceeds the *sexual object* and the act towards which the instinct tends the *sexual aim*. Scientifically sifted observation, then, shows that numerous deviations occur in respect of both of these - the sexual object and the sexual aim. The relation between these deviations and what is assumed to be normal requires thorough investigation.

¹ The information contained in this first essay is derived from the well-known writings of Krafft-Ebing, Moll, Moebius, Havelock Ellis, Schrenck-Notzing, Löwenfeld, Eulenburg, Bloch and Hirschfeld, and from the *Jahrbuch für sexuelle Zwischenstufen*, published under the direction of the last-named author. Since full bibliographies of the remaining literature of the subject will be found in the works of these writers, I have been able to spare myself the necessity for giving detailed references. [Added 1910:] The data obtained from the psycho-analytic investigation of inverts are based upon material supplied to me by I Sadger and upon my own findings.

² [Footnote added 1910:] The only appropriate word in the German language, '*Lust*', is unfortunately ambiguous, and is used to denote the experience both of a need and of a gratification.

(1) DEVIATIONS IN RESPECT OF THE SEXUAL OBJECT

(A) INVERSION

The popular view of the sexual instinct is beautifully reflected in the poetic fable which tells how the original human beings were cut up into two halves - man and woman - and how these are always striving to unite again in love. It comes as a great surprise therefore to learn that there are men whose sexual object is a man and not a woman, and women whose sexual object is a woman and not a man. People of this kind are described as having 'contrary sexual feelings', or better, as being 'inverts', and the fact is described as 'inversion'. The number of such people is very considerable, though there are difficulties in establishing it precisely.¹

BEHAVIOUR OF INVERTS Such people vary greatly in their behaviour in several respects.

(a) They may be *absolute* inverts. In that case their sexual objects are exclusively of their own sex. Persons of the opposite sex are never the object of their sexual desire, but leave them cold, or even arouse sexual aversion in them. As a consequence of this aversion, they are incapable, if they are men, of carrying out the sexual act, or else they derive no enjoyment from it.

(b) They may be *amphigenic* inverts, that is psychosexual hermaphrodites. In that case their sexual objects may equally well be of their own or of the opposite sex. This kind of inversion thus lacks the characteristic of exclusiveness.

(c) They may be *contingent* inverts. In that case, under certain external conditions - of which inaccessibility of any normal sexual object and imitation are the chief - they are capable of taking as their sexual object someone of their own sex and of deriving satisfaction from sexual intercourse with him.

¹ On these difficulties and on the attempts which have been made to arrive at the proportional number of inverts, see Hirschfeld (1904).

Again, inverts vary in their views as to the peculiarity of their sexual instinct. Some of them accept their inversion as something in the natural course of things, just as a normal person accepts the direction of *his* libido, and insist energetically that inversion is as legitimate as the normal attitude; others rebel against their inversion and feel it as a pathological compulsion.¹

Other variations occur which relate to questions of time. The trait of inversion may either date back to the very beginning, as far back as the subject's memory reaches, or it may not have become noticeable till some particular time before or after puberty.² It may either persist throughout life, or it may go into temporary abeyance, or again it may constitute an episode on the way to a normal development. It may even make its first appearance late in life after a long period of normal sexual activity. A periodic oscillation between a normal and an inverted sexual object has also sometimes been observed. Those cases are of particular interest in which the libido changes over to an inverted sexual object after a distressing experience with a normal one.

As a rule these different kinds of variations are found side by side independently of one another. It is, however, safe to assume that the most extreme form of inversion will have been present from a very early age and that the person concerned will feel at one with his peculiarity.

Many authorities would be unwilling to class together all the various cases which I have enumerated and would prefer to lay stress upon their differences rather than their resemblances, in accordance with their own preferred view of inversion. Nevertheless, though the distinctions cannot be disputed, it is impossible to overlook the existence of numerous intermediate examples of every type, so that we are driven to conclude that we are dealing with a connected series.

¹ The fact of a person struggling in this way against a compulsion towards inversion may perhaps determine the possibility of his being influenced by suggestion [*Added* 1910:] or psycho-analysis.

² Many writers have insisted with justice that the dates assigned by inverts themselves for the appearance of their tendency to inversion are untrustworthy, since they may have repressed the evidence of their heterosexual feelings from their memory. [*Added* 1910:] These suspicions have been confirmed by psycho-analysis in those cases of inversion to which it has had access; it has produced decisive alterations in their anamnesis by filling in their infantile amnesia.

NATURE OF INVERSION The earliest assessments regarded inversion as an innate indication of nervous degeneracy. This corresponded to the fact that medical observers first came across it in persons suffering, or appearing to suffer, from nervous diseases. This characterization of inversion involves two suppositions, which must be considered separately: that it is innate and that it is degenerate.

DEGENERACY The attribution of degeneracy in this connection is open to the objections which can be raised against the indiscriminate use of the word in general. It has become the fashion to regard any symptom which is not obviously due to trauma or infection as a sign of degeneracy. Magnan's classification of degenerates is indeed of such a kind as not to exclude the possibility of the concept of degeneracy being applied to a nervous system whose general functioning is excellent. This being so, it may well be asked whether an attribution of 'degeneracy' is of any value or adds anything to our knowledge. It seems wiser only to speak of it where

- (1) several serious deviations from the normal are found together, and
- (2) the capacity for efficient functioning and survival seem to be severely impaired.¹

¹ Moebius (1900) confirms the view that we should be chary in making a diagnosis of degeneracy and that it has very little practical value: 'If we survey the wide field of degeneracy upon which some glimpses of revealing light have been thrown in these pages, it will at once be clear that there is small value in ever making a diagnosis of degeneracy.'

Several facts go to show that in this legitimate sense of the word inverts cannot be regarded as degenerate:

- (1) Inversion is found in people who exhibit no other serious deviations from the normal.
- (2) It is similarly found in people whose efficiency is unimpaired, and who are indeed distinguished by specially high intellectual development and ethical culture.¹
- (3) If we disregard the patients we come across in our medical practice, and cast our eyes round a wider horizon, we shall come in two directions upon facts which make it impossible to regard inversion as a sign of degeneracy:
 - (a) Account must be taken of the fact that inversion was a frequent phenomenon - one might almost say an institution charged with important functions - among the peoples of antiquity at the height of their civilization.
 - (b) It is remarkably widespread among many savage and primitive races, whereas the concept of degeneracy is usually restricted to states of high civilization (cf. Bloch); and, even amongst the civilized peoples of Europe, climate and race exercise the most powerful influence on the prevalence of inversion and upon the attitude adopted towards it.²

INNATE CHARACTER As may be supposed, innateness is only attributed to the first, most extreme, class of inverts, and the evidence for it rests upon assurances given by them that at no time in their lives has their sexual instinct shown any sign of taking another course. The very existence of the two other classes, and especially the third, is difficult to reconcile with the hypothesis of the innateness of inversion. This explains why those who support this view tend to separate out the group of absolute inverts from all the rest, thus abandoning any attempt at giving an account of inversion which shall have universal application. In the view of these authorities inversion is innate in one group of cases, while in others it may have come about in other ways.

¹ It must be allowed that the spokesmen of 'Uranism' are justified in asserting that some of the most prominent men in all recorded history were inverts and perhaps even absolute inverts.

² The pathological approach to the study of inversion has been displaced by the anthropological. The merit for bringing about this change is due to Bloch (1902-3), who has also laid stress on the occurrence of inversion among the civilizations of antiquity.

The reverse of this view is represented by the alternative one that inversion is an acquired character of the sexual instinct. This second view is based on the following considerations:

(1) In the case of many inverts, even absolute ones, it is possible to show that very early in their lives a sexual impression occurred which left a permanent after-effect in the shape of a tendency to homosexuality.

(2) In the case of many others, it is possible to point to external influences in their lives, whether of a favourable or inhibiting character, which have led sooner or later to a fixation of their inversion. (Such influences are exclusive relations with persons of their own sex, comradeship in war, detention in prison, the dangers of heterosexual intercourse, celibacy, sexual weakness, etc.)

(3) Inversion can be removed by hypnotic suggestion, which would be astonishing in an innate characteristic.

In view of these considerations it is even possible to doubt the very existence of such a thing as innate inversion. It can be argued (cf. Havelock Ellis) that, if the cases of allegedly innate inversion were more closely examined, some experience of their early childhood would probably come to light which had a determining effect upon the direction taken by their libido. This experience would simply have passed out of the subject's conscious recollection, but could be recalled to his memory under appropriate influence. In the opinion of these writers inversion can only be described as a frequent variation of the sexual instinct, which can be determined by a number of external circumstances in the subject's life.

The apparent certainty of this conclusion is, however, completely countered by the reflection that many people are subjected to the same sexual influences (e.g. to seduction or mutual masturbation, which may occur in early youth) without becoming inverted or without remaining so permanently. We are therefore forced to a suspicion that the choice between 'innate' and 'acquired' is not an exclusive one or that it does not cover all the issues involved in inversion.

EXPLANATION OF INVERSION The nature of inversion is explained neither by the hypothesis that it is innate nor by the alternative hypothesis that it is acquired. In the former case we must ask in what respect it is innate, unless we are to accept the crude explanation that everyone is born with his sexual instinct attached to a particular sexual object. In the latter case it may be questioned whether the various accidental influences would be sufficient to explain the acquisition of inversion without the co-operation of something in the subject himself. As we have already shown, the existence of this last factor is not to be denied.

BISEXUALITY A fresh contradiction of popular views is involved in the considerations put forward by Lydston, Kiernan and Chevalier in an endeavour to account for the possibility of sexual inversion. It is popularly believed that a human being is either a man or a woman. Science, however, knows of cases in which the sexual characters are obscured, and in which it is consequently difficult to determine the sex. This arises in the first instance in the field of anatomy. The genitals of the individuals concerned combine male and female characteristics. (This condition is known as hermaphroditism.) In rare cases both kinds of sexual apparatus are found side by side fully developed (true hermaphroditism); but far more frequently both sets of organs are found in an atrophied condition.¹

The importance of these abnormalities lies in the unexpected fact that they facilitate our understanding of normal development. For it appears that a certain degree of anatomical hermaphroditism occurs normally. In every normal male or female individual, traces are found of the apparatus of the opposite sex. These either persist without function as rudimentary organs or become modified and take on other functions.

These long-familiar facts of anatomy lead us to suppose that an originally bisexual physical disposition has, in the course of evolution, become modified into a unisexual one, leaving behind only a few traces of the sex that has become atrophied.

It was tempting to extend this hypothesis to the mental sphere and to explain inversion in all its varieties as the expression of a psychical hermaphroditism. All that was required further in order to settle the question was that inversion should be regularly accompanied by the mental and somatic signs of hermaphroditism.

¹ For the most recent descriptions of somatic hermaphroditism, see Taruffi (1903), and numerous papers by Neugebauer in various volumes of the *Jahrbuch für sexuelle Zwischenstufen*.

But this expectation was disappointed. It is impossible to demonstrate so close a connection between the hypothetical psychical hermaphroditism and the established anatomical one. A general lowering of the sexual instinct and a slight anatomical atrophy of the organs is found frequently in inverts (cf. Havelock Ellis, 1915). Frequently, but by no means regularly or even usually. The truth must therefore be recognized that inversion and somatic hermaphroditism are on the whole independent of each other.

A great deal of importance, too, has been attached to what are called the secondary and tertiary sexual characters and to the great frequency of the occurrence of those of the opposite sex in inverts (cf. Havelock Ellis, 1915). Much of this, again, is correct; but it should never be forgotten that in general the secondary and tertiary sexual characters of one sex occur very frequently in the opposite one. They are indications of hermaphroditism, but are not attended by any change of sexual object in the direction of inversion.

Psychical hermaphroditism would gain substance if the inversion of the sexual object were at least accompanied by a parallel change-over of the subject's other mental qualities, instincts and character traits into those marking the opposite sex. But it is only in inverted women that character-inversion of this kind can be looked for with any regularity. In men the most complete mental masculinity can be combined with inversion. If the belief in psychical hermaphroditism is to be persisted in, it will be necessary to add that its manifestations in various spheres show only slight signs of being mutually determined. Moreover the same is true of somatic hermaphroditism: according to Halban (1903),¹ occurrences of individual atrophied organs and of secondary sexual characters are to a considerable extent independent of one another.

¹ His paper includes a bibliography of the subject.

The theory of bisexuality has been expressed in its crudest form by a spokesman of the male inverts: 'a feminine brain in a masculine body'. But we are ignorant of what characterizes a feminine brain. There is neither need nor justification for replacing the psychological problem by the anatomical one. Krafft-Ebing's attempted explanation seems to be more exactly framed than that of Ulrichs but does not differ from it in essentials. According to Krafft-Ebing (1895, 5), every individual's bisexual disposition endows him with masculine and feminine brain centres as well as with somatic organs of sex: these centres develop only at puberty, for the most part under the influence of the sex-gland, which is independent of them in the original disposition. But what has just been said of masculine and feminine brains applies equally to masculine and feminine 'centres'; and incidentally we have not even any grounds for assuming that certain areas of the brain ('centres') are set aside for the functions of sex, as is the case, for instance with those of speech.¹

Nevertheless, two things emerge from these discussions. In the first place, a bisexual disposition is somehow concerned in inversion, though we do not know in what that disposition consists, beyond anatomical structure. And secondly, we have to deal with disturbances that affect the sexual instinct in the course of its development.

¹ It appears (from a bibliography given in the sixth volume of the *Jahrbuch für sexuelle Zwischenstufen*) that E. Gley was the first writer to suggest bisexuality as an explanation of inversion. As long ago as in January, 1884, he published a paper, 'Les aberrations de l'instinct sexuel', in the *Revue Philosophique*. It is, moreover, noteworthy that the majority of authors who derive inversion from bisexuality bring forward that factor not only in the case of inverts, but also for all those who have grown up to be normal, and that, as a logical consequence, they regard inversion as the result of a disturbance in development. Chevalier (1893) already writes in this sense. Krafft-Ebing (1895, 10) remarks that there are a great number of observations 'which prove at least the virtual persistence of this second centre (that of the subordinated sex).' A Dr. Arduin (1900) asserts that 'there are masculine and feminine elements in every human being (cf. Hirschfeld, 1899); but one set of these - according to the sex of the person in question - is incomparably more strongly developed than the other, so far as heterosexual individuals are concerned. . . .' Herman (1903) is convinced that 'masculine elements and characteristics are present in every woman and feminine ones in every man', etc. [Added 1910:] Fliess (1906) subsequently claimed the idea of bisexuality (in the sense of *duality of sex*) as his own. [Added 1924:] In lay circles the hypothesis of human bisexuality is regarded as being due to O. Weininger, the philosopher, who died at an early age, and who made the idea the basis of a somewhat unbalanced book (1903). The particulars which I have enumerated above will be sufficient to show how little justification there is for the claim.

SEXUAL OBJECT OF INVERTS The theory of psychical hermaphroditism presupposes that the sexual object of an invert is the opposite of that of a normal person. An inverted man, it holds, is like a woman in being subject to the charm that proceeds from masculine attributes both physical and mental: he feels he is a woman in search of a man.

But however well this applies to quite a number of inverts, it is, nevertheless, far from revealing a universal characteristic of inversion. There can be no doubt that a large proportion of male inverts retain the mental quality of masculinity, that they possess relatively few of the secondary characters of the opposite sex and that what they look for in their sexual object are in fact feminine mental traits. If this were not so, how would it be possible to explain the fact that male prostitutes who offer themselves to inverts - to-day just as they did in ancient times imitate women in all the externals of their clothing and behaviour? Such imitation would otherwise inevitably clash with the ideal of the inverts. It is clear that in Greece, where the most masculine men were numbered among the inverts, what excited a man's love was not the *masculine* character of a boy, but his physical resemblance to a woman as well as his feminine mental qualities - his shyness, his modesty and his need for instruction and assistance. As soon as the boy became a man he ceased to be a sexual object for men and himself, perhaps, became a lover of boys. In this instance, therefore, as in many others, the sexual object is not someone of the same sex but someone who combines the characters of both sexes; there is as, it were, a compromise between an impulse that seeks for a man and one that seeks for a woman, while it remains a paramount condition that the object's body (i.e. genitals) shall be masculine. Thus the sexual object is a kind of reflection of the subject's own bisexual nature.¹

The position in the case of women is less ambiguous; for among them the active inverts exhibit masculine characteristics, both physical and mental, with peculiar frequency and look for femininity in their sexual objects - though here again a closer knowledge of the facts might reveal greater variety.

¹ [Footnote added 1910:] It is true that psycho-analysis has not yet produced a complete explanation of the origin of inversion; nevertheless, it has discovered the psychical mechanism of its development, and has made essential contributions to the statement of the problems involved. In all the cases we have examined we have established the fact that the future inverts, in the earliest years of their childhood, pass through a phase of very intense but short lived fixation to a woman (usually their mother), and that, after leaving this behind, they identify themselves with a woman and take *themselves* as their sexual object. That is to say, they proceed from a narcissistic basis, and look for a young man who resembles themselves and whom *they* may love as their mother loved *them*. Moreover, we have frequently found that alleged inverts have been by no means insusceptible to the charms of women, but have continually transposed the excitation aroused by women on to a male object. They have thus repeated all through their lives the mechanism by which their inversion arose. Their compulsive longing for men has turned out to be determined by their ceaseless flight from women.

[Added 1915:] Psycho-analytic research is most decidedly opposed to any attempt at separating off homosexuals from the rest of mankind as a group of a special character. By studying sexual excitations other than those that are manifestly displayed, it has found that all human beings are capable of making a homosexual object-choice and have in fact made one in their unconscious. Indeed, libidinal attachments to persons of the same sex play no less a part as factors in normal mental life, and a greater part as a motive force for illness, than do similar attachments to the opposite sex. On the contrary, psycho-analysis considers that a choice of an object independently of its sex - freedom to range equally over male and female objects - as it is found in childhood, in primitive states of society and early periods of history, is the original basis from which, as a result of restriction in one direction or the other, both the normal and the inverted types develop. Thus from the point of view of psycho-analysis the exclusive sexual interest felt by men for women is also a problem that needs elucidating and is not a self-evident fact based upon an attraction that is ultimately of a chemical nature. A person's final sexual attitude is not decided until after puberty and is the result of a number of factors, not all of which are yet known; some are of a constitutional nature but others are accidental. No doubt a few of these factors may happen to carry so much weight that they influence the result in their sense. But in general the multiplicity of determining factors is reflected in the variety of manifest sexual attitudes in which they find their issue in mankind. In inverted types, a predominance of archaic constitutions and primitive psychical mechanisms is regularly to be found. Their most essential characteristics seem to be a coming into operation of narcissistic object-choice and a retention of the erotic significance of the anal zone. There is nothing to be gained, however, by separating the most extreme types of inversion from the rest on the basis of constitutional peculiarities of that kind. What we find as an apparently sufficient explanation of these types can be equally shown to be present, though less strongly, in the constitution of transitional types and of those whose manifest attitude is normal. The differences in the end-products may be of a qualitative nature, but analysis shows that the differences between their determinants are only quantitative. Among the accidental factors that influence object-choice we have found that frustration (in the form of an early deterrence, by fear, from sexual activity) deserves attention, and we have observed that the presence of both parents plays an important part. The absence of a strong father in childhood not infrequently favours the occurrence of inversion. Finally, it may be insisted that the concept of inversion in respect of the sexual object should be sharply distinguished from that of the occurrence in the subject of a mixture of sexual characters. In the relation between these two factors, too, a certain degree of reciprocal independence is unmistakably present.

Three Essays On The Theory Of Sexuality

[Added 1920:] Ferenczi (1914) has brought forward a number of interesting points on the subject of inversion. He rightly protests that, because they have in common the symptom of inversion, a large number of conditions, which are very different from one another and which are of unequal importance both in organic and psychical respects, have been thrown together under the name of 'homosexuality' (or, to follow him in giving it a better name, 'homo-erotism'). He insists that a sharp distinction should at least be made between two types: 'subject homo-erotics', who feel and behave like women, and 'object homo-erotics', who are completely masculine and who have merely exchanged a female for a male object. The first of these two types he recognizes as true 'sexual intermediates' in Hirschfeld's sense of the word; the second he describes, less happily, as obsessional neurotics. According to him, it is only in the case of object homo-erotics that there is any question of their struggling against their inclination to inversion or of the possibility of their being influenced psychologically. While granting the existence of these two types, we may add that there are many people in whom a certain quantity of subject homo-erotism is found in combination with a proportion of object homo-erotism.

During the last few years work carried out by biologists, notably by Steinach, has thrown a strong light on the organic determinants of homo-erotism and of sexual characters in general. By carrying out experimental castration and subsequently grafting the sex-glands of the opposite sex, it was possible in the case of various species of mammals to transform a male into a female and vice versa. The transformation affected more or less completely both the somatic sexual characters and the psychosexual attitude (that is, both subject and object erotism). It appeared that the vehicle of the force which thus acted as a sex-determinant was not the part of the sex-gland which forms the sex-cells but what is known as its interstitial tissue (the 'puberty-gland'). In one case this transformation of sex was actually effected in a man who had lost his testes owing to tuberculosis. In his sexual life he behaved in a feminine manner, as a passive homosexual, and exhibited very clearly marked feminine sexual characters of a secondary kind (e.g. in regard to growth of hair and beard and deposits of fat on the breasts and hips). After an undescended testis from another male patient had been grafted into him, he began to behave in a masculine manner and to direct his libido towards women in a normal way. Simultaneously his somatic feminine characters disappeared. (Lipschütz, 1919, 356-7.)

It would be unjustifiable to assert that these interesting experiments put the theory of inversion on a new basis, and it would be hasty to expect them to offer a universal means of 'curing' homosexuality. Fliess has rightly insisted that these experimental findings do not invalidate the theory of the general bisexual disposition of the higher animals. On the contrary, it seems to me probable that further research of a similar kind will produce a direct confirmation of this presumption of bisexuality.

SEXUAL AIM OF INVERTS The important fact to bear in mind is that no one single aim can be laid down as applying in cases of inversion. Among men, intercourse *per annum* by no means coincides with inversion; masturbation is quite as frequently their exclusive aim, and it is even true that restrictions of sexual aim - to the point of its being limited to simple outpourings of emotion - are commoner among them than among heterosexual lovers. Among women, too, the sexual aims of inverts are various: there seems to be a special preference for contact with the mucous membrane of the mouth.

CONCLUSION It will be seen that we are not in a position to base a satisfactory explanation of the origin of inversion upon the material at present before us. Nevertheless our investigation has put us in possession of a piece of knowledge which may turn out to be of greater importance to us than the solution of that problem. It has been brought to our notice that we have been in the habit of regarding the connection between the sexual instinct and the sexual object as more intimate than it in fact is. Experience of the cases that are considered abnormal has shown us that in them the sexual instinct and the sexual object are merely soldered together - a fact which we have been in danger of overlooking in consequence of the uniformity of the normal picture, where the object appears to form part and parcel of the instinct. We are thus warned to loosen the bond that exists in our thoughts between instinct and object. It seems probable that the sexual instinct is in the first instance independent of its object; nor is its origin likely to be due to its object's attractions.

(B) SEXUALLY IMMATURE PERSONS AND ANIMALS AS SEXUAL OBJECTS

People whose sexual objects belong to the normally inappropriate sex - that is, invert - strike the observer as a collection of individuals who may be quite sound in other respects. On the other hand, cases in which sexually immature persons (children) are chosen as sexual objects are instantly judged as sporadic aberrations. It is only exceptionally that children are the exclusive sexual objects in such a case. They usually come to play that part when someone who is cowardly or has become impotent adopts them as a substitute, or when an urgent instinct (one which will not allow of postponement) cannot at the moment get possession of any more appropriate object. Nevertheless, a light is thrown on the nature of the sexual instinct by the fact that it permits of so much variation in its objects and such a cheapening of them - which hunger, with its far more energetic retention of its objects, would only permit in the most extreme instances. A similar consideration applies to sexual intercourse with animals, which is by no means rare, especially among country people, and in which sexual attraction seems to override the barriers of species.

One would be glad on aesthetic grounds to be able to ascribe these and other severe aberrations of the sexual instinct to insanity; but that cannot be done. Experience shows that disturbances of the sexual instinct among the insane do not differ from those that occur among the healthy and in whole races or occupations. Thus the sexual abuse of children is found with uncanny frequency among school teachers and child attendants, simply because they have the best opportunity for it. The insane merely exhibit any such aberration to an intensified degree; or, what is particularly significant, it may become exclusive and replace normal sexual satisfaction entirely.

The very remarkable relation which thus holds between sexual variations and the descending scale from health to insanity gives us plenty of material for thought. I am inclined to believe that it may be explained by the fact that the impulses of sexual life are among those which, even normally, are the least controlled by the higher activities of the mind. In my experience anyone who is in any way, whether socially or ethically, abnormal mentally is invariably abnormal also in his sexual life. But many people are abnormal in their sexual life who in every other respect approximate to the average, and have, along with the rest, passed through the process of human cultural development, in which sexuality remains the weak spot.

The most general conclusion that follows from all these discussions seems, however, to be this. Under a great number of conditions and in surprisingly numerous individuals, the nature and importance of the sexual object recedes into the background. What is essential and constant in the sexual instinct is something else.¹

¹ [Footnote added 1910:] The most striking distinction between the erotic life of antiquity and our own no doubt lies in the fact that the ancients laid the stress upon the instinct itself, whereas we emphasize its object. The ancients glorified the instinct and were prepared on its account to honour even an inferior object; while we despise the instinctual activity in itself, and find excuses for it only in the merits of the object.

(2) DEVIATIONS IN RESPECT OF THE SEXUAL AIM

The normal sexual aim is regarded as being the union of the genitals in the act known as copulation, which leads to a release of the sexual tension and a temporary extinction of the sexual instinct - a satisfaction analogous to the sating of hunger. But even in the most normal sexual process we may detect rudiments which, if they had developed, would have led to the deviations described as 'perversions'. For there are certain intermediate relations to the sexual object, such as touching and looking at it, which lie on the road towards copulation and are recognized as being preliminary sexual aims. On the one hand these activities are themselves accompanied by pleasure, and on the other hand they intensify the excitation, which should persist until the final sexual aim is attained. Moreover, the kiss, one particular contact of this kind, between the mucous membrane of the lips of the two people concerned, is held in high sexual esteem among many nations (including the most highly civilized ones), in spite of the fact that the parts of the body involved do not form part of the sexual apparatus but constitute the entrance to the digestive tract. Here, then, are factors which provide a point of contact between the perversions and normal sexual life and which can also serve as a basis for their classification. Perversions are sexual activities which either (a) extend, in an anatomical sense, beyond the regions of the body that are designed for sexual union, or (b) linger over the intermediate relations to the sexual object which should normally be traversed rapidly on the path towards the final sexual aim.

(A) ANATOMICAL EXTENSIONS

OVERVALUATION OF THE SEXUAL OBJECT It is only in the rarest instances that the psychical valuation that is set on the sexual object, as being the goal of the sexual instinct, stops short at its genitals. The appreciation extends to the whole body of the sexual object and tends to involve every sensation derived from it. The same overvaluation spreads over into the psychological sphere: the subject becomes, as it were, intellectually infatuated (that is, his powers of judgement are weakened) by the mental achievements and perfections of the sexual object and he submits to the latter's judgements with credulity. Thus the credulity of love becomes in important, if not the most fundamental, source of *authority*.¹

This sexual overvaluation is something that cannot be easily reconciled with a restriction of the sexual aim to union of the actual genitals and it helps to turn activities connected with other parts of the body into sexual aims.²

The significance of the factor of sexual overvaluation can be best studied in men, for their erotic life alone has become accessible to research. That of women - partly owing to the stunting effect of civilized conditions and partly owing to their conventional secretiveness and insincerity - is still veiled in an impenetrable obscurity.³

¹ In this connection I cannot help recalling the credulous submissive less shown by a hypnotized subject towards his hypnotist. This leads one to suspect that the essence of hypnosis lies in an unconscious fixation of the subject's libido to the figure of the hypnotist, through the medium of the masochistic components of the sexual instinct. [*Added 1910:*] Ferenczi (1909) has brought this characteristic of suggestibility into relation with the 'parental complex'.

² It must be pointed out, however, that sexual overvaluation is not developed in the case of *every* mechanism of object-choice. We shall become acquainted later on with another and more direct explanation of the sexual role assumed by the other parts of the body. The factor of 'craving for stimulation' has been put forward by Noche and Bloch as an explanation of the extension of sexual interest to parts of the body other than the genitals; but it does not seem to me to deserve such an important place. The various channels along which the libido passes are related to each other from the very first like inter-communicating pipes, and we must take the phenomenon of collateral flow into account.

³ [*Footnote added 1920:*] In typical cases women fail to exhibit any sexual overvaluation towards men; but they scarcely ever fail to do so towards their own children.

SEXUAL USE OF THE MUCOUS MEMBRANE OF THE LIPS AND MOUTH The use of the mouth as a sexual organ is regarded as a perversion if the lips (or tongue) of one person are brought into contact with the genitals of another, but not if the mucous membranes of the lips of both of them come together. This exception is the point of contact with what is normal. Those who condemn the other practices (which have no doubt been common among mankind from *primaeval* times) as being perversions, are giving way to an unmistakable feeling of *disgust*, which protects them from accepting sexual aims of the kind. The limits of such disgust are, however, often purely conventional: a man who will kiss a pretty girl's lips passionately, may perhaps be disgusted at the idea of using her tooth-brush, though there are no grounds for supposing that his own oral cavity, for which he feels no disgust, is any cleaner than the girl's. Here, then, our attention is drawn to the factor of disgust, which interferes with the libidinal overvaluation of the sexual object but can in turn be overridden by libido. Disgust seems to be one of the forces which have led to a restriction of the sexual aim. These forces do not as a rule extend to the genitals themselves. But there is no doubt that the genitals of the opposite sex can in themselves be an object of disgust and that such an attitude is one of the characteristics of all hysterics, and especially of hysterical women. The sexual instinct in its strength enjoys overriding this disgust. (See below.)

SEXUAL USE OF THE ANAL ORIFICE Where the anus is concerned it becomes still clearer that it is disgust which stamps that sexual aim as a perversion. I hope, however, I shall not be accused of partisanship when I assert that people who try to account for this disgust by saying that the organ in question serves the function of excretion and comes in contact with excrement - a thing which is disgusting in itself - are not much more to the point than hysterical girls who account for their disgust at the male genital by saying that it serves to void urine.

The playing of a sexual part by the mucous membrane of the anus is by no means limited to intercourse between men: preference for it is in no way characteristic of inverted feeling. On the contrary, it seems that *paedecatio* with a male owes its origin to an analogy with a similar act performed with a woman; while mutual masturbation is the sexual aim most often found in intercourse between inverts.

SIGNIFICANCE OF OTHER REGIONS OF THE BODY The extension of sexual interest to other regions of the body, with all its variations, offers us nothing that is new in principle; it adds nothing to our knowledge of the sexual instinct, which merely proclaims its intention in this way of getting possession of the sexual object in every possible direction. But these anatomical extensions inform us that, besides sexual overvaluation, there is a second factor at work which is strange to popular knowledge. Certain regions of the body, such as the mucous membrane of the mouth and anus, which are constantly appearing in these practices, seem, as it were, to be claiming that they should themselves be regarded and treated as genitals. We shall learn later that this claim is justified by the history of the development of the sexual instinct and that it is fulfilled in the symptomatology of certain pathological states.

UNSUITABLE SUBSTITUTES FOR THE SEXUAL OBJECT - FETISHISM There are some cases which are quite specially remarkable - those in which the normal sexual object is replaced by another which bears some relation to it, but is entirely unsuited to serve the normal sexual aim. From the point of view of classification, we should no doubt have done better to have mentioned this highly interesting group of aberrations of the sexual instinct among the deviations in respect of the sexual *object*. But we have postponed their mention till we could become acquainted with the factor of sexual overvaluation, on which these phenomena, being connected with an abandonment of the sexual aim, are dependent.

What is substituted for the sexual object is some part of the body (such as the foot or hair) which is in general very inappropriate for sexual purposes, or some inanimate object which bears an assignable relation to the person whom it replaces and preferably to that person's sexuality (e.g. a piece of clothing or underlinen). Such substitutes are with some justice likened to the fetishes in which savages believe that their gods are embodied.

A transition to those cases of fetishism in which the sexual aim, whether normal or perverse, is entirely abandoned is afforded by other cases in which the sexual object is required to fulfil a fetishistic condition - such as the possession of some particular hair-colouring or clothing, or even some bodily defect if the sexual aim is to be attained. No other variation of the sexual instinct that borders on the pathological can lay so much claim to our interest as this one, such is the peculiarity of the phenomena to which it gives rise. Some degree of diminution in the urge towards the normal sexual aim (an executive weakness of the sexual apparatus) seems to be a necessary precondition in every case.¹ The point of contact with the normal is provided by the psychologically essential overvaluation of the sexual object, which inevitably extends to everything that is associated with it. A certain degree of fetishism is thus habitually present in normal love, especially in those stages of it in which the normal sexual aim seems unattainable or its fulfilment prevented:

Schaff' mir ein Halstuch von ihrer Brust,
Ein Strumpfband meiner Liebeslust!²

¹ [Footnote added 1915:] This weakness would represent the *constitutional* precondition. Psycho-analysis has found that the phenomenon can also be *accidentally* determined, by the occurrence of an early deterrence from sexual activity owing to fear, which may divert the subject from the normal sexual aim and encourage him to seek a substitute for it.

² [Get me a kerchief from her breast,
A garter that her knee has pressed.]

The situation only becomes pathological when the longing for the fetish passes beyond the point of being merely a necessary condition attached to the sexual object and actually *takes the place* of the normal aim, and, further, when the fetish becomes detached from a particular individual and becomes the *sole* sexual object. These are, indeed, the general conditions under which mere variations of the sexual instinct pass over into pathological aberrations.

Binet (1888) was the first to maintain (what has since been confirmed by a quantity of evidence) that the choice of a fetish is an after-effect of some sexual impression received as a rule in early childhood. (This may be brought into line with the proverbial durability of first loves: *on revient toujours à ses premiers amours*.) This derivation is particularly obvious in cases where there is merely a fetishistic condition attached to the sexual object. We shall come across the importance of early sexual impressions again in another connection.¹

¹ [Footnote added 1920:] Deeper-going psycho-analytic research has raised a just criticism of Binet's assertion. All the observations dealing with this point have recorded a first meeting with the fetish at which it already aroused sexual interest without there being anything in the accompanying circumstances to explain the fact. Moreover, all of these 'early' sexual impressions relate to a time after the age of five or six, whereas psycho-analysis makes it doubtful whether fresh pathological fixations can occur so late as this. The true explanation is that behind the first recollection of the fetish's appearance there lies a submerged and forgotten phase of sexual development. The fetish, like a 'screen memory', represents this phase and is thus a remnant and precipitate of it. The fact that this early infantile phase turns in the direction of fetishism, as well as the choice of the fetish itself, are constitutionally determined.

In other cases the replacement of the object by a fetish is determined by a symbolic connection of thought, of which the person concerned is usually not conscious. It is not always possible to trace the course of these connections with certainty (The foot, for instance, is an age-old sexual symbol which occurs even in mythology;¹ no doubt the part played by fur as a fetish owes its origin to an association with the hair of the *mons Veneris*.) None the less even symbolism such as this is not always unrelated to sexual experiences in childhood.²

¹ [*Footnote added 1910:*] The shoe or slipper is a corresponding symbol of the *female* genitals.

² Psycho-analysis has cleared up one of the remaining gaps in our understanding of fetishism. It has shown the importance, as regards the choice of a fetish, of a coprophilic pleasure in smelling which has disappeared owing to repression. Both the feet and the hair are objects with a strong smell which have been exalted into fetishes after the olfactory sensation has become unpleasurable and been abandoned. Accordingly, in the perversion that corresponds to foot fetishism, it is only dirty and evil-smelling feet that become sexual objects. Another factor that helps towards explaining the fetishistic preference for the foot is to be found among the sexual theories of children (see below p. 1514): the foot represents a woman's penis, the absence of which is deeply felt. [*Added 1915:*] In a number of cases of foot-fetishism it has been possible to show that the scopophilic instinct, seeking to reach its object (originally the genitals) from underneath, was brought to a halt in its pathway by prohibition and repression. For that reason it became attached to a fetish in the form of a foot or shoe, the female genitals (in accordance with the expectations of childhood/children) being imagined as male ones.

(B) FIXATIONS OF PRELIMINARY SEXUAL AIMS

APPEARANCE OF NEW AIMS Every external or internal factor that hinders or postpones the attainment of the normal sexual aim (such as impotence, the high price of the sexual object or the danger of the sexual act) will evidently lend support to the tendency to linger over the preparatory activities and to turn them into new sexual aims that can take the place of the normal one. Attentive examination always shows that even what seem to be the strangest of these new aims are already hinted at in the normal sexual process.

TOUCHING AND LOOKING A certain amount of touching is indispensable (at all events among human beings) before the normal sexual aim can be attained. And everyone knows what a source of pleasure on the one hand and what an influx of fresh excitation on the other is afforded by tactile sensations of the skin of the sexual object. So that lingering over the stage of touching can scarcely be counted a perversion, provided that in the long run the sexual act is carried further.

The same holds true of seeing - an activity that is ultimately derived from touching. Visual impressions remain the most frequent pathway along which libidinal excitation is aroused; indeed, natural selection counts upon the accessibility of this pathway - if such a teleological form of statement is permissible - when it encourages the development of beauty in the sexual object. The progressive concealment of the body which goes along with civilization keeps sexual curiosity awake. This curiosity seeks to complete the sexual object by revealing its hidden parts. It can, however, be diverted ('sublimated') in the direction of art, if its interest can be shifted away from the genitals on to the shape of the body as a whole.¹ It is usual for most normal people to linger to some extent over the intermediate sexual aim of a looking that has a sexual tinge to it; indeed, this offers them a possibility of directing some proportion of their libido on to higher artistic aims. On the other hand, this pleasure in looking becomes a perversion (a) if it is restricted exclusively to the genitals, or (b) if it is connected with the overriding of disgust (as in the case of *voyeurs* or people who look on at excretory functions), or (c) if, instead of being *preparatory* to the normal sexual aim, it supplants it. This last is markedly true of exhibitionists, who, if I may trust the findings of several analyses, exhibit their own genitals in order to obtain a reciprocal view of the genitals of the other person.²

In the perversions which are directed towards looking and being looked at, we come across a very remarkable characteristic with which we shall be still more intensely concerned in the aberration that we shall consider next: in these perversions the sexual aim occurs in two forms, an *active* and a *passive* one.

The force which opposes scopophilia, but which may be overridden by it (in a manner parallel to what we have previously seen in the case of disgust), is *shame*.

¹ [Footnote added 1915:] There is to my mind no doubt that the concept of 'beautiful' has its roots in sexual excitation and that its original meaning was 'sexually stimulating'. This is related to the fact that we never regard the genitals themselves, which produce the strongest sexual excitation, as really 'beautiful'.

² [Footnote added 1920:] Under analysis, these perversions - and indeed most others - reveal a surprising variety of motives and determinants. The compulsion to exhibit, for instance, is also closely dependent on the castration complex: it is a means of constantly insisting upon the integrity of the subject's own (male) genitals and it reiterates his infantile satisfaction at the absence of a penis in those of women.

SADISM AND MASOCHISM The most common and the most significant of all the perversions - the desire to inflict pain upon the sexual object, and its reverse - received from Krafft-Ebing the names of 'sadism' and 'masochism' for its active and passive forms respectively. Other writers have preferred the narrower term 'alogagnia'. This emphasizes the pleasure in *pain*, the cruelty; whereas the names chosen by Krafft-Ebing bring into prominence the pleasure in any form of humiliation or subjection.

As regards active alogagnia, sadism, the roots are easy to detect in the normal. The sexuality of most male human beings contains an element of *aggressiveness* - a desire to subjugate; the biological significance of it seems to lie in the need for overcoming the resistance of the sexual object by means other than the process of wooing. Thus sadism would correspond to an aggressive component of the sexual instinct which has become independent and exaggerated and, by displacement, has usurped the leading position.

In ordinary speech the connotation of sadism oscillates between, on the one hand, cases merely characterized by an active or violent attitude to the sexual object, and, on the other hand, cases in which satisfaction is entirely conditional on the humiliation and maltreatment of the object. Strictly speaking, it is only this last extreme instance which deserves to be described as a perversion.

Similarly, the term masochism comprises any passive attitude towards sexual life and the sexual object, the extreme instance of which appears to be that in which satisfaction is conditional upon suffering physical or mental pain at the hands of the sexual object. Masochism, in the form of a perversion, seems to be further removed from the normal sexual aim than its counterpart; it may be doubted at first whether it can ever occur as a primary phenomenon or whether, on the contrary, it may not invariably arise from a transformation of sadism.¹ It can often be shown that masochism is nothing more than an extension of sadism turned round upon the subject's own self, which thus, to begin with, takes the place of the sexual object. Clinical analysis of extreme cases of masochistic perversion show that a great number of factors (such as the castration complex and the sense of guilt) have combined to exaggerate and fixate the original passive sexual attitude.

¹ [Footnote added 1924:] My opinion of masochism has been to a large extent altered by later reflection, based upon certain hypotheses as to the structure of the apparatus of the mind and the classes of instincts operating in it. I have been led to distinguish a primary or *erotogenic* masochism, out of which two later forms, *feminine* and *moral* masochism, have developed. Sadism which cannot find employment in actual life is turned round upon the subject's own self and so produces a *secondary* masochism, which is superadded to the primary kind. (Cf. Freud, 1924c.)

Pain, which is overridden in such cases, thus falls into line with disgust and shame as a force that stands in opposition and resistance to the libido.

Sadism and masochism occupy a special position among the perversions, since the contrast between activity and passivity which lies behind them is among the universal characteristics of sexual life.

The history of human civilization shows beyond any doubt that there is an intimate connection between cruelty and the sexual instinct; but nothing has been done towards explaining the connection, apart from laying emphasis on the aggressive factor in the libido. According to some authorities this aggressive element of the sexual instinct is in reality a relic of cannibalistic desires - that is, it is a contribution derived from the apparatus for obtaining mastery, which is concerned with the satisfaction of the other and, ontogenetically, the older of the great instinctual needs.¹ It has also been maintained that every pain contains in itself the possibility of a feeling of pleasure. All that need be said is that no satisfactory explanation of this perversion has been put forward and that it seems possible that a number of mental impulses are combined in it to produce a single resultant.²

But the most remarkable feature of this perversion is that its active and passive forms are habitually found to occur together in the same individual. A person who feels pleasure in producing pain in someone else in a sexual relationship is also capable of enjoying as pleasure any pain which he may himself derive from sexual relations. A sadist is always at the same time a masochist, although the active or the passive aspect of the perversion may be the more strongly developed in him and may represent his predominant sexual activity.³

We find, then, that certain among the impulses to perversion occur regularly as pairs of opposites; and this, taken in conjunction with material which will be brought forward later, has a high theoretical significance.⁴ It is, moreover, a suggestive fact that the existence of the pair of opposites formed by sadism and masochism cannot be attributed merely to the element of aggressiveness. We should rather be inclined to connect the simultaneous presence of these opposites with the opposing masculinity and femininity which are combined in bisexuality - a contrast which often has to be replaced in psycho-analysis by that between activity and passivity.

¹ [Footnote added 1915:] Cf. my remarks below on the pregenital phases of sexual development, which confirm this view.

² [Footnote added 1924:] The enquiry mentioned above has led me to assign a peculiar position, based upon the origin of the instincts, to the pair of opposites constituted by sadism and masochism, and to place them outside the class of the remaining 'perversions'.

³ Instead of multiplying the evidence for this statement, I will quote a passage from Havelock Ellis (1913, 119): 'The investigation of histories of sadism and masochism, even those given by Krafft-Ebing (as indeed Colin Scott and Féré have already pointed out), constantly reveals traces of both groups of phenomena in the same individual.'

⁴ [Footnote added 1915:] Cf. my discussion of 'ambivalence' below.

(3) THE PERVERSIONS IN GENERAL

VARIATION AND DISEASE It is natural that medical men, who first studied perversions in outstanding examples and under special conditions, should have been inclined to regard them, like inversion, as indications of degeneracy or disease. Nevertheless, it is even easier to dispose of that view in this case than in that of inversion. Everyday experience has shown that most of these extensions, or at any rate the less severe of them, are constituents which are rarely absent from the sexual life of healthy people, and are judged by them no differently from other intimate events. If circumstances favour such an occurrence, normal people too can substitute a perversion of this kind for the normal sexual aim for quite a time, or can find place for the one alongside the other. No healthy person, it appears, can fail to make some addition that might be called perverse to the normal sexual aim; and the universality of this finding is in itself enough to show how inappropriate it is to use the word perversion as a term of reproach. In the sphere of sexual life we are brought up against peculiar and, indeed, insoluble difficulties as soon as we try to draw a sharp line to distinguish mere variations within the range of what is physiological from pathological symptoms.

Nevertheless, in some of these perversions the quality of the new sexual aim is of a kind to demand special examination. Certain of them are so far removed from the normal in their content that we cannot avoid pronouncing them 'pathological'. This is especially so where (as, for instance, in cases of licking excrement or of intercourse with dead bodies) the sexual instinct goes to astonishing lengths in successfully overriding the resistances of shame, disgust, horror or pain. But even in such cases we should not be too ready to assume that people who act in this way will necessarily turn out to be insane or subject to grave abnormalities of other kinds. Here again we cannot escape from the fact that people whose behaviour is in other respects normal can, under the domination of the most unruly of all the instincts, put themselves in the category of sick persons in the single sphere of sexual life. On the other hand, manifest abnormality in the other relations of life can invariably be shown to have a background of abnormal sexual conduct.

In the majority of instances the pathological character in a perversion is found to lie not in the *content* of the new sexual aim but in its relation to the normal. If a perversion, instead of appearing merely *alongside* the normal sexual aim and object, and only when circumstances are unfavourable to *them* and favourable to *it* - if, instead of this, it ousts them completely and takes their place in all circumstances - if, in short, a perversion has the characteristics of exclusiveness and fixation - then we shall usually be justified in regarding it as a pathological symptom.

THE MENTAL FACTOR IN THE PERVERSIONS It is perhaps in connection precisely with the most repulsive perversions that the mental factor must be regarded as playing its largest part in the transformation of the sexual instinct. It is impossible to deny that in their case a piece of mental work has been performed which, in spite of its horrifying result, is the equivalent of an idealization of the instinct. The omnipotence of love is perhaps never more strongly proved than in such of its aberrations as these. The highest and the lowest are always closest to each other in the sphere of sexuality: 'vom Himmel durch die Welt zur Hölle.'¹

TWO CONCLUSIONS Our study of the perversions has shown us that the sexual instinct has to struggle against certain mental forces which act as resistances, and of which shame and disgust are the most prominent. It is permissible to suppose that these forces play a part in restraining that instinct within the limits that are regarded as normal; and if they develop in the individual before the sexual instinct has reached its full strength, it is no doubt they that will determine the course of its development.²

In the second place we have found that some of the perversions which we have examined are only made intelligible if we assume the convergence of several motive forces. If such perversions admit of analysis, that is, if they can be taken to pieces, then they must be of a composite nature. This gives us a hint that perhaps the sexual instinct itself may be no simple thing, but put together from components which have come apart again in the perversions. If this is so, the clinical observation of these abnormalities will have drawn our attention to amalgamations which have been lost to view in the uniform behaviour of normal people.³

¹ ['From Heaven, across the world, to Hell.']

² [Footnote added 1915:] On the other hand, these forces which act like dams upon sexual development - disgust, shame and morality - must also be regarded as historical precipitates of the external inhibitions to which the sexual instinct has been subjected during the psychogenesis of the human race. We can observe the way in which, in the development of individuals, they arise at the appropriate moment, as though spontaneously, when upbringing and external influence give the signal.

³ [Footnote added 1920:] As regards the origin of the perversions, I will add a word in anticipation of what is to come. There is reason to suppose that, just as in the case of fetishism, abortive beginnings of normal sexual development occur before the perversions become fixated. Analytic investigation has already been able to show in a few cases that perversions are a residue of development towards the Oedipus complex and that after the repression of that complex the components of the sexual instinct which are strongest in the disposition of the individual concerned emerge once more.

(4) THE SEXUAL INSTINCT IN NEUROTICS

PSYCHO-ANALYSIS An important addition to our knowledge of the sexual instinct in certain people who at least approximate to the normal can be obtained from a source which can only be reached in one particular way. There is only one means of obtaining exhaustive information that will not be misleading about the sexual life of the persons known as 'psychoneurotics' - sufferers from hysteria, from obsessional neurosis, from what is wrongly described as neurasthenia, and, undoubtedly, from dementia praecox and paranoia was well. They must be subjected to psycho-analytic investigation, which is employed in the therapeutic procedure introduced by Josef Breuer and myself in 1893 and known at that time as 'catharsis'.

I must first explain - as I have already done in other writings - that all my experience shows that these psychoneuroses are based on sexual instinctual forces. By this I do not merely mean that the energy of the sexual instinct makes a contribution to the forces that maintain the pathological manifestations (the symptoms). I mean expressly to assert that that contribution is the most important and only constant source of energy of the neurosis and that in consequence the sexual life of the persons in question is expressed - whether exclusively or principally or only partly - in these symptoms. As I have put it elsewhere, the symptoms constitute the sexual activity of the patient. The evidence for this assertion is derived from the ever-increasing number of psycho-analyses of hysterical and other neurotics which I have carried out during the last 25 years and of whose findings I have given (and shall continue to give) a detailed account in other publications.¹

¹ [*Footnote added 1920:*] It implies no qualification of the above assertion, but rather an amplification of it, if I restate it as follows: neurotic symptoms are based on the one hand on the demands of the libidinal instincts and on the other hand on those made by the ego by way of reaction to them.

The removal of the symptoms of hysterical patients by psycho-analysis proceeds on the supposition that those symptoms are substitutes - transcriptions as it were - for a number of emotionally cathected mental processes, wishes and desires, which, by the operation of a special psychical procedure (repression), have been prevented from obtaining discharge in psychical activity that is admissible to consciousness. These mental processes, therefore, being held back in a state of unconsciousness, strive to obtain an expression that shall be appropriate to their emotional importance - to obtain discharge; and in the case of hysteria they find such an expression (by means of the process of 'conversion') in somatic phenomena, that is, in hysterical symptoms. By systematically turning these symptoms back (with the help of a special technique) into emotionally cathected ideas - ideas that will now have become conscious - it is possible to obtain the most accurate knowledge of the nature and origin of these formerly unconscious psychical structures.

FINDINGS OF PSYCHO-ANALYSIS In this manner the fact has emerged that symptoms represent a substitute for impulses the source of whose strength is derived from the sexual instinct. What we know about the nature of hysterics before they fall ill - and they may be regarded as typical of all psychoneurotics - and about the occasions which precipitate their falling ill, is in complete harmony with this view. The character of hysterics shows a degree of sexual repression in excess of the normal quantity, an intensification of resistance against the sexual instinct (which we have already met with in the form of shame, disgust and morality), and what seems like an instinctive aversion on their part to any intellectual consideration of sexual problems. As a result of this, in especially marked cases, the patients remain in complete ignorance of sexual matters right into the period of sexual maturity.¹

On a cursory view, this trait, which is so characteristic of hysteria, is not uncommonly screened by the existence of a second constitutional character present in hysteria, namely the predominant development of the sexual instinct. Psycho-analysis, however, can invariably bring the first of these factors to light and clear up the enigmatic contradiction which hysteria presents, by revealing the pair of opposites by which it is characterized - exaggerated sexual craving and excessive aversion to sexuality.

¹ Breuer writes of the patient in connection with whom he first adopted the cathartic method: 'The factor of sexuality was astonishingly undeveloped in her.'

In the case of anyone who is predisposed to hysteria, the onset of his illness is precipitated when, either as a result of his own progressive maturity or of the external circumstances of his life, he finds himself faced by the demands of a real sexual situation. Between the pressure of the instinct and his antagonism to sexuality, illness offers him a way of escape. It does not solve his conflict, but seeks to evade it by transforming his libidinal impulses into symptoms. The exception is only an *apparent* one when a hysteric - a male patient it may be - falls ill as a result of some trivial emotion, some conflict which does not centre around any sexual interest. In such cases psycho-analysis is regularly able to show that the illness has been made possible by the sexual component of the conflict, which has prevented the mental processes from reaching a normal issue.

NEUROSIS AND PERVERSION There is no doubt that a large part of the opposition to these views of mine is due to the fact that sexuality, to which I trace back psycho-neurotic symptoms, is regarded as though it coincided with the normal sexual instinct. But psycho-analytic teaching goes further than this. It shows that it is by no means only at the cost of the so-called *normal* sexual instinct that these symptoms originate - at any rate such is not exclusively or mainly the case; they also give expression (by conversion) to instincts which would be described as *perverse* in the widest sense of the word if they could be expressed directly in phantasy and action without being diverted from consciousness. Thus symptoms are formed in part at the cost of *abnormal* sexuality; *neuroses are, so to say, the negative of the perversions.*¹

¹ The contents of the clearly conscious phantasies of perverts (which in favourable circumstances can be transformed into manifest behaviour), of the delusional fears of paranoids (which are projected in a hostile sense on to other people) and of the unconscious phantasies of hysterics (which psycho-analysis reveals behind their symptoms) - all of these coincide with one another even down to their details.

The sexual instinct of psychoneurotics exhibits all the aberrations which we have studied as variations of normal, and as manifestations of abnormal, sexual life.

(a) The unconscious mental life of all neurotics (without exception) shows inverted impulses, fixation of their libido upon persons of their own sex. It would be impossible without deep discussion to give any adequate appreciation of the importance of this factor in determining the form taken by the symptoms of the illness. I can only insist that an unconscious tendency to inversion is never absent and is of particular value in throwing light upon hysteria in men.¹

(b) It is possible to trace in the unconscious of psychoneurotics tendencies to every kind of anatomical extension of sexual activity and to show that those tendencies are factors in the formation of symptoms. Among them we find occurring with particular frequency those in which the mucous membrane of the mouth and anus are assigned the role of genitals.

(c) An especially prominent part is played as factors in the formation of symptoms in psychoneuroses by the component instincts, which emerge for the most part as pairs of opposites and which we have met with as introducing new sexual aims - the scopophilic instinct and exhibitionism and the active and passive forms of the instinct for cruelty. The contribution made by the last of these is essential to the understanding of the fact that symptoms involve *suffering*, and it almost invariably dominates a part of the patient's social behaviour. It is also through the medium of this connection between libido and cruelty that the transformation of love into hate takes place, the transformation of affectionate into hostile impulses, which is characteristic of a great number of cases of neurosis, and indeed, it would seem, of paranoia in general.

The interest of these findings is still further increased by certain special facts.

(a) Whenever we find in the unconscious an instinct of this sort which is capable of being paired off with an opposite one, this second instinct will regularly be found in operation as well. Every active perversion is thus accompanied by its passive counterpart: anyone who is an exhibitionist in his unconscious is at the same time a *voyeur*; in anyone who suffers from the consequences of repressed sadistic impulses there is sure to be another determinant of his symptoms which has its source in masochistic inclinations. The complete agreement which is here shown with what we have found to exist in the corresponding 'positive' perversions is most remarkable, though in the actual symptoms one or other of the opposing tendencies plays the predominant part.

(β) In any fairly marked case of psychoneurosis it is unusual for only a single one of these perverse instincts to be developed. We usually find a considerable number and as a rule traces of them all. The degree of development of each particular instinct is, however, independent of that of the others. Here, too, the study of the 'positive' perversions provides an exact counterpart.

¹ Psychoneuroses are also very often associated with *manifest* inversion. In such cases the heterosexual current of feeling has undergone complete suppression. It is only fair to say that my attention was first drawn to the necessary universality of the tendency to inversion in psychoneurotics by Wilhelm Fliess of Berlin, after I had discussed its presence in individual cases. - [Added 1920:] This fact, which has not been sufficiently appreciated, cannot fail to have a decisive influence on any theory of homosexuality.

(5) COMPONENT INSTINCTS AND EROTOGENIC ZONES

If we put together what we have learned from our investigation of positive and negative perversions, it seems plausible to trace them back to a number of 'component instincts', which, however, are not of a primary nature, but are susceptible to further analysis. By an 'instinct' is provisionally to be understood the psychical representative of an endosomatic, continuously flowing source of stimulation, as contrasted with a 'stimulus', which is set up by *single* excitations coming from *without*. The concept of instinct is thus one of those lying on the frontier between the mental and the physical. The simplest and likeliest assumption as to the nature of instincts would seem to be that in itself an instinct is without quality, and, so far as mental life is concerned, is only to be regarded as a measure of the demand made upon the mind for work. What distinguishes the instincts from one another and endows them with specific qualities is their relation to their somatic sources and to their aims. The source of an instinct is a process of excitation occurring in an organ and the immediate aim of the instinct lies in the removal of this organic stimulus.¹

There is a further provisional assumption that we cannot escape in the theory of the instincts. It is to the effect that excitations of two kinds arise from the somatic organs, based upon differences of a chemical nature. One of these kinds of excitation we describe as being specifically sexual, and we speak of the organ concerned as the 'erotogenic zone' of the sexual component instinct arising from it.²

¹ [Footnote added 1924:] The theory of the instincts is the most important but at the same time the least complete portion of psycho-analytic theory. I have made further contributions to it in my later works *Beyond the Pleasure Principle* (1920g) and *The Ego and the Id* (1923b).

² [Footnote added 1915:] It is not easy in the present place to justify these assumptions, derived as they are from the study of a particular class of neurotic illness. But on the other hand, if I omitted all mention of them, it would be impossible to say anything of substance about the instincts.

The part played by the erotogenic zones is immediately obvious in the case of those perversions which assign a sexual significance to the oral and anal orifices. These behave in every respect like a portion of the sexual apparatus. In hysteria these parts of the body and the neighbouring tracts of mucous membrane become the seat of new sensations and of changes in innervation - indeed, of processes that can be compared to erection - in just the same way as do the actual genitalia under the excitations of the normal sexual processes.

The significance of the erotogenic zones as apparatuses subordinate to the genitals and as substitutes for them is, among all the psychoneuroses, most clearly to be seen in hysteria; but this does not imply that that significance is any the less in the other forms of illness. It is only that in them it is less recognizable, because in their case (obsessional neurosis and paranoia) the formation of the symptoms takes place in regions of the mental apparatus which are more remote from the particular centres concerned with somatic control. In obsessional neurosis what is more striking is the significance of those impulses which create new sexual aims and seem independent of erotogenic zones. Nevertheless, in scopophilia and exhibitionism the eye corresponds to an erotogenic zone; while in the case of those components of the sexual instinct which involve pain and cruelty the same role is assumed by the skin - the skin, which in particular parts of the body has become differentiated into sense organs or modified into mucous membrane, and is thus the erotogenic zone *par excellence*.¹

¹ We are reminded at this point of Moll's analysis of the sexual instinct into an instinct of 'contractation' and an instinct of 'detumescence'. Contractation represents a need for contact with the skin.

(6) REASONS FOR THE APPARENT PREPONDERANCE OF PERVERSE SEXUALITY IN THE PSYCHONEUROSES

The preceding discussion may perhaps have placed the sexuality of psychoneurotics in a false light. It may have given the impression that, owing to their disposition, psychoneurotics approximate closely to pervers in their sexual behaviour and are proportionately remote from normal people. It may indeed very well be that the constitutional disposition of these patients (apart from their exaggerated degree of sexual repression and the excessive intensity of their sexual instinct) includes an unusual tendency to perversion, using that word in its widest sense. Nevertheless, investigation of comparatively slight cases shows that this last assumption is not absolutely necessary, or at least that in forming a judgement on these pathological developments there is a factor to be considered which weighs in the other direction. Most psychoneurotics only fall ill after the age of puberty as a result of the demands made upon them by normal sexual life. (It is most particularly against the latter that repression is directed.) Or else illnesses of this kind set in later, when the libido fails to obtain satisfaction along normal lines. In both these cases the libido behaves like a stream whose main bed has become blocked. It proceeds to fill up collateral channels which may hitherto have been empty. Thus, in the same way, what appears to be the strong tendency (though, it is true, a negative one) of psychoneurotics to perversion may be collaterally determined, and must, in any case, be collaterally intensified. The fact is that we must put sexual repression as an internal factor alongside such external factors as limitation of freedom, inaccessibility of a normal sexual object, the dangers of the normal sexual act, etc., which bring about perversions in persons who might perhaps otherwise have remained normal.

In this respect different cases of neurosis may behave differently: in one case the preponderating factor may be the innate strength of the tendency to perversion, in another it may be the collateral increase of that tendency owing to the libido being forced away from a normal sexual aim and sexual object. It would be wrong to represent as opposition what is in fact a co-operative relation. Neurosis will always produce its greatest effects when constitution and experience work together in the same direction. Where the constitution is a marked one it will perhaps not require the support of actual experiences; while a great shock in real life will perhaps bring about a neurosis even in an average constitution. (Incidentally, this view of the relative aetiological importance of what is innate and what is accidentally experienced applies equally in other fields.)

If we prefer to suppose, nevertheless, that a particularly strongly developed tendency to perversion is among the characteristics of psychoneurotic constitutions, we have before us the prospect of being able to distinguish a number of such constitutions according to the innate preponderance of one or the other of the erotogenic zones or of one or the other of the component instincts. The question whether a special relation holds between the perverse disposition and the particular form of illness adopted, has, like so much else in this field, not yet been investigated.

(7) INTIMATION OF THE INFANTILE CHARACTER OF SEXUALITY

By demonstrating the part played by perverse impulses in the formation of symptoms in the psychoneuroses, we have quite remarkably increased the number of people who might be regarded as perverts. It is not only that neurotics in themselves constitute a very numerous class, but it must also be considered that an unbroken chain bridges the gap between the neuroses in all their manifestations and normality. After all, Moebius could say with justice that we are all to some extent hysterics. Thus the extraordinarily wide dissemination of the perversions forces us to suppose that the disposition to perversions is itself of no great rarity but must form a part of what passes as the normal constitution.

It is, as we have seen, debatable whether the perversions go back to innate determinants or arise, as Binet assumed was the case with fetishism, owing to chance experiences. The conclusion now presents itself to us that there is indeed something innate lying behind the perversions but that it is something innate in *everyone*, though as a disposition it may vary in its intensity and may be increased by the influences of actual life. What is in question are the innate constitutional roots of the sexual instinct. In one class of cases (the perversions) these roots may grow into the actual vehicles of sexual activity; in others they may be submitted to an insufficient suppression (repression) and thus be able in a roundabout way to attract a considerable proportion of sexual energy to themselves as symptoms; while in the most favourable cases, which lie between these two extremes, they may by means of effective restriction and other kinds of modification bring about what is known as normal sexual life.

We have, however, a further reflection to make. This postulated constitution, containing the germs of all the perversions, will only be demonstrable in *children*, even though in them it is only with modest degrees of intensity that any of the instincts can emerge. A formula begins to take shape which lays it down that the sexuality of neurotics has remained in, or been brought back to, an infantile state. Thus our interest turns to the sexual life of children, and we will now proceed to trace the play of influences which govern the evolution of infantile sexuality till its outcome in perversion, neurosis or normal sexual life.

II

INFANTILE SEXUALITY

NEGLECT OF THE INFANTILE FACTOR One feature of the popular view of the sexual instinct is that it is absent in childhood and only awakens in the period of life described as puberty. This, however, is not merely a simple error but one that has had grave consequences, for it is mainly to this idea that we owe our present ignorance of the fundamental conditions of sexual life. A thorough study of the sexual manifestations of childhood would probably reveal the essential characters of the sexual instinct and would show us the course of its development and the way in which it is put together from various sources.

It is noticeable that writers who concern themselves with explaining the characteristics and reactions of the adult have devoted much more attention to the *primaeval* period which is comprised in the life of the individual's ancestors - have, that is, ascribed much more influence to heredity - than to the other *primaeval* period, which falls within the lifetime of the individual himself - that is, to childhood. One would surely have supposed that the influence of this latter period would be easier to understand and could claim to be considered before that of heredity.¹ It is true that in the literature of the subject one occasionally comes across remarks upon precocious sexual activity in small children - upon erections, masturbation and even activities resembling coitus. But these are always quoted only as exceptional events, as oddities or as horrifying instances of precocious depravity. So far as I know, not a single author has clearly recognized the regular existence of a sexual instinct in childhood; and in the writings that have become so numerous on the development of children, the chapter on 'Sexual Development' is as a rule omitted.²

¹ [Footnote added 1915:] Nor is it possible to estimate correctly the part played by heredity until the part played by childhood has been assessed.

² The assertion made in the text has since struck me myself as being so bold that I have undertaken the task of testing its validity by looking through the literature once more. The outcome of this is that I have allowed my statement to stand unaltered. The scientific examination of both the physical and mental phenomena of sexuality in childhood is still in its earliest beginnings. One writer, Bell (1902, 327), remarks: 'I know of no scientist who has given a careful analysis of the emotion as it is seen in the adolescent.' Somatic sexual manifestations from the period before puberty have only attracted attention in connection with phenomena of degeneracy and as indications of degeneracy. In none of the accounts which I have read of the psychology of this period of life is a chapter to be found on the erotic life of children; and this applies to the well-known works of Preyer, Baldwin (1898), Perez (1886), Strümpell (1899), Groos (1904), Heller (1904), Sully (1895) and others. We can obtain the clearest impression of the state of things in this field to-day from the periodical *Die Kinderfehler* from 1896 onwards. Nevertheless the conviction is borne in upon us that the existence of love in childhood stands in no need of discovery. Perez (1886, 272 ff.) argues in favour of its existence. Groos (1899, 326) mentions as a generally recognized fact that 'some children are already accessible to sexual impulses at a very early age and feel an urge to have contact with the opposite sex'. The earliest instance of the appearance of 'sex-love' recorded by Bell (1902, 330) concerns a child in the middle of his third year. On this point compare further Havelock Ellis (1913, Appendix B).

[Added 1910:] This judgement upon the literature of infantile sexuality need no longer be maintained since the appearance of Stanley Hall's exhaustive work (1904). No such modification is necessitated by Moll's recent book (1909). See, on the other hand, Bleuler (1908). [Added 1915:] Since this was written, a book by Hug-Hellmuth (1913) has taken the neglected sexual factor fully into account.

INFANTILE AMNESIA The reason for this strange neglect is to be sought, I think, partly in considerations of propriety, which the authors obey as a result of their own upbringing, and partly in a psychological phenomenon which has itself hitherto eluded explanation. What I have in mind is the peculiar amnesia which, in the case of most people, though by no means all, hides the earliest beginnings of their childhood up to their sixth or eighth year. Hitherto it has not occurred to us to feel any astonishment at the fact of this amnesia, though we might have had good grounds for doing so. For we learn from other people that during these years, of which at a later date we retain nothing in our memory but a few unintelligible and fragmentary recollections, we reacted in a lively manner to impressions, that we were capable of expressing pain and joy in a human fashion, that we gave evidence of love, jealousy and other passionate feelings by which we were strongly moved at the time, and even that we gave utterance to remarks which were regarded by adults as good evidence of our possessing insight and the beginnings of a capacity for judgement. And of all this we, when we are grown up, have no knowledge of our own! Why should our memory lag so far behind the other activities of our minds? We have, on the contrary, good reason to believe that there is no period at which the capacity for receiving and reproducing impressions is greater than precisely during the years of childhood.¹

¹ I have attempted to solve one of the problems connected with the earliest memories of childhood in a paper on 'Screen Memories' (1899a). [Added 1924:] See also Chapter IV of my *Psychopathology of Everyday Life* (1901b).

On the other hand we must assume, or we can convince ourselves by a psychological examination of other people, that the very same impressions that we have forgotten have none the less left the deepest traces on our minds and have had a determining effect upon the whole of our later development. There can, therefore, be no question of any real abolition of the impressions of childhood, but rather of an amnesia similar to that which neurotics exhibit for later events, and of which the essence consists in a simple withholding of these impressions from consciousness, viz., in their repression. But what are the forces which bring about this repression of the impressions of childhood? Whoever could solve this riddle would, I think, have explained *hysterical* amnesia as well.

Meanwhile we must not fail to observe that the existence of infantile amnesia provides a new point of comparison between the mental states of children and psychoneurotics. We have already come across another such point in the formula to which we were led, to the effect that the sexuality of psychoneurotics has remained at, or been carried back to, an infantile stage. Can it be, after all, that infantile amnesia, too, is to be brought into relation with the sexual impulses of childhood?

Moreover, the connection between infantile and hysterical amnesia is more than a mere play upon words. Hysterical amnesia, which occurs at the bidding of repression, is only explicable by the fact that the subject is already in possession of a store of memory-traces which have been withdrawn from conscious disposal, and which are now, by an associative link, attracting to themselves the material which the forces of repression are engaged in repelling from consciousness.¹ It may be said that without infantile amnesia there would be no hysterical amnesia.

I believe, then, that infantile amnesia, which turns everyone's childhood into something like a prehistoric epoch and conceals from him the beginnings of his own sexual life, is responsible for the fact that in general no importance is attached to childhood in the development of sexual life. The gaps in our knowledge which have arisen in this way cannot be bridged by a single observer. As long ago as in the year 1896 I insisted on the significance of the years of childhood in the origin of certain important phenomena connected with sexual life, and since then I have never ceased to emphasize the part played in sexuality, by the infantile factor.

¹ [Footnote added 1915:] The mechanism of repression cannot be understood unless account is taken of *both* of these two concurrent processes. They may be compared with the manner in which tourists are conducted to the top of the Great Pyramid of Giza by being pushed from one direction and pulled from the other.

THE PERIOD OF SEXUAL LATENCY IN CHILDHOOD AND ITS INTERRUPTIONS

The remarkably frequent reports of what are described as irregular and exceptional sexual impulses in childhood, as well as the uncovering in neurotics of what have hitherto been unconscious memories of childhood, allow us to sketch out the sexual occurrences of that period in some such way as this.¹

There seems no doubt that germs of sexual impulses are already present in the new-born child and that these continue to develop for a time, but are then overtaken by a progressive process of suppression; this in turn is itself interrupted by periodical advances in sexual development or may be held up by individual peculiarities. Nothing is known for certain concerning the regularity and periodicity of this oscillating course of development. It seems, however, that the sexual life of children usually emerges in a form accessible to observation round about the third or fourth year of life.²

¹ We are able to make use of the second of these two sources material since we are justified in expecting that the early years of children who are later to become neurotic are not likely in this respect to differ *essentially* from those of children who are to grow up into normal adults, [added 1915:] but only in the intensity and clarity of the phenomena involved.

² There is a possible anatomical analogy to what I believe to be the course of development of the infantile sexual function in Bayer's discovery (1902) that the internal sexual organs (i.e. the uterus) are as a rule larger in new-born children than in older ones. It is not certain, however, what view we should take of this involution that occurs after birth (which has been shown by Halban to apply also to other portions of the genital apparatus). According to Halban (1904) the process of involution comes to an end after a few weeks of extra-uterine life. [Added 1920:] Those authorities who regard the interstitial portion of the sex-gland as the organ that determines sex have on their side been led by anatomical researches to speak of infantile sexuality and a period of sexual latency. I quote a passage from Lipschütz's book (1919, 168), which I mentioned on p. 1473 *n.*: 'We shall be doing more justice to the facts if we say that the maturation of the sexual characters which is accomplished at puberty is only due to a great acceleration which occurs at that time of processes which began much earlier - in my view as early as during intra-uterine life.' 'What has hitherto been described in a summary way as puberty is probably only a second major phase of puberty which sets in about the middle of the second decade of life . . . Childhood, from birth until the beginning of this second major phase, might be described as "the intermediate phase of puberty"' (ibid., 170). Attention was drawn to this coincidence between anatomical findings and psychological observation in a review by Ferenczi (1920). The agreement is marred only by the fact that the 'first peak' in the development of the sexual organ occurs during the early intra-uterine period, whereas the early efflorescence of infantile sexual life must be ascribed to the third and fourth years of life. There is, of course, no need to expect that anatomical growth and psychical development must be exactly simultaneous. The researches in question were made on the sex-glands of human beings. Since a period of latency in the psychological sense does not occur in animals, it would be very interesting to know whether the anatomical findings which have led these writers to assume the occurrence of two peaks in sexual development are also demonstrable in the higher animals.

SEXUAL INHIBITIONS It is during this period of total or only partial latency that are built up the mental forces which are later to impede the course of the sexual instinct and, like dams, restrict its flow - disgust, feelings of shame and the claims of aesthetic and moral ideals. One gets an impression from civilized children that the construction of these dams is a product of education, and no doubt education has much to do with it. But in reality this development is organically determined and fixed by heredity, and it can occasionally occur without any help at all from education. Education will not be trespassing beyond its appropriate domain if it limits itself to following the lines which have already been laid down organically and to impressing them somewhat more clearly and deeply.

REACTION-FORMATION AND SUBLIMATION What is it that goes to the making of these constructions which are so important for the growth of a civilized and normal individual? They probably emerge at the cost of the infantile sexual impulses themselves. Thus the activity of those impulses does not cease even during this period of latency, though their energy is diverted, wholly or in great part, from their sexual use and directed to other ends. Historians of civilization appear to be at one in assuming that powerful components are acquired for every kind of cultural achievement by this diversion of sexual instinctual forces from sexual aims and their direction to new ones - a process which deserves the name of 'sublimation'. To this we would add, accordingly, that the same process plays a part in the development of the individual and we would place its beginning in the period of sexual latency of childhood.¹

It is possible further to form some idea of the mechanism of this process of sublimation. On the one hand, it would seem, the sexual impulses cannot be utilized during these years of childhood, since the reproductive functions have been deferred - a fact which constitutes the main feature of the period of latency. On the other hand, these impulses would seem in themselves to be perverse - that is, to arise from erotogenic zones and to derive their activity from instincts which, in view of the direction of the subject's development, can only arouse unpleasurable feelings. They consequently evoke opposing mental forces (reacting impulses) which, in order to suppress this unpleasure effectively, build up the mental dams that have already mentioned - disgust, shame and morality.²

¹ Once again, it is from Fliess that I have borrowed the term 'period of sexual latency'.

² [*Footnote added 1915:*] In the case which I am here discussing, the sublimation of sexual instinctual forces takes place along the path of reaction-formation. But in general it is possible to distinguish the concepts of sublimation and reaction-formation from each other as two different processes. Sublimation can also take place by other and simpler mechanisms.

INTERRUPTIONS OF THE LATENCY PERIOD We must not deceive ourselves as to the hypothetical nature and insufficient clarity of our knowledge concerning the processes of the infantile period of latency or deferment; but we shall be on firmer ground in pointing out that such an application of infantile sexuality represents an educational ideal from which individual development usually diverges at some point and often to a considerable degree. From time to time a fragmentary manifestation of sexuality which has evaded sublimation may break through; or some sexual activity may persist through the whole duration of the latency period until the sexual instinct emerges with greater intensity at puberty. In so far as educators pay any attention at all to infantile sexuality, they behave exactly as though they shared our views as to the construction of the moral defensive forces at the cost of sexuality, and as though they knew that sexual activity makes a child ineducable: for they stigmatize every sexual manifestation by children as a 'vice', without being able to do much against it. We, on the other hand, have every reason for turning our attention to these phenomena which are so much dreaded by education, for we may expect them to help us to discover the original configuration of the sexual instincts.

THE MANIFESTATIONS OF INFANTILE SEXUALITY

THUMB-SUCKING For reasons which will appear later, I shall take thumb-sucking (or sensual sucking) as a sample of the sexual manifestations of childhood. (An excellent study of this subject has been made by the Hungarian paediatrician, Lindner, 1879.)

Thumb-sucking appears already in early infancy and may continue into maturity, or even persist all through life. It consists in the rhythmic repetition of a sucking contact by the mouth (or lips). There is no question of the purpose of this procedure being the taking of nourishment. A portion of the lip itself, the tongue, or any other part of the skin within reach - even the big toe - may be taken as the object upon which this sucking is carried out. In this connection a grasping-instinct may appear and may manifest itself as a simultaneous rhythmic tugging at the lobes of the ears or a catching hold of some part of another person (as a rule the ear) for the same purpose. Sensual sucking involves a complete absorption of the attention and leads either to sleep or even to a motor reaction in the nature of an orgasm.¹ It is not infrequently combined with rubbing some sensitive part of the body such as the breast or the external genitalia. Many children proceed by this path from sucking to masturbation.

¹ Thus we find at this early stage, what holds good all through life, that sexual satisfaction is the best soporific. Most cases of nervous insomnia can be traced back to lack of sexual satisfaction. It is well known that unscrupulous nurses put crying children to sleep by stroking their genitals.

Lindner himself clearly recognized the sexual nature of this activity and emphasized it without qualification. In the nursery, sucking is often classed along with the other kinds of sexual 'naughtiness' of children. This view has been most energetically repudiated by numbers of paediatricians and nerve-specialists, though this is no doubt partly due to a confusion between 'sexual' and 'genital'. Their objection raises a difficult question and one which cannot be evaded: what is the general characteristic which enables us to recognize the sexual manifestations of children? The concatenation of phenomena into which we have been given an insight by psycho-analytic investigation justifies us, in my opinion, in regarding thumb-sucking as a sexual manifestation and in choosing it for our study of the essential features of infantile sexual activity.¹

¹ [*Footnote added 1920:*] In 1919, a Dr. Galant published, under the title of 'Das Lutscherli', the confession of a grown-up girl who had never given up this infantile sexual activity and who represents the satisfaction to be gained from sucking as something completely analogous to sexual satisfaction, particularly when this is obtained from a lover's kiss: 'Not every kiss is equal to a "*Lutscherli*" - no, no, not by any means! It is impossible to describe what a lovely feeling goes through your whole body when you suck; you are right away from this world. You are absolutely satisfied, and happy beyond desire. It is a wonderful feeling; you long for nothing but peace - uninterrupted peace. It is just unspeakably lovely: you feel no pain and no sorrow, and ah! you are carried into another world.'

AUTO-EROTISM We are in duty bound to make a thorough examination of this example. It must be insisted that the most striking feature of this sexual activity is that the instinct is not directed towards other people, but obtains satisfaction from the subject's own body. It is 'auto-erotic', to call it by a happily chosen term introduced by Havelock Ellis (1910).¹

Furthermore, it is clear that the behaviour of a child who indulges in thumb-sucking is determined by a search for some pleasure which has already been experienced and is now remembered. In the simplest case he proceeds to find this satisfaction by sucking rhythmically at some part of the skin or mucous membrane. It is also easy to guess the occasions on which the child had his first experiences of the pleasure which he is now striving to renew. It was the child's first and most vital activity, his sucking at his mother's breast, or at substitutes for it, that must have familiarized him with this pleasure. The child's lips, in our view, behave like an erotogenic zone, and no doubt stimulation by the warm flow of milk is the cause of the pleasurable sensation. The satisfaction of the erotogenic zone is associated, in the first instance, with the satisfaction of the need for nourishment. To begin with, sexual activity attaches itself to functions serving the purpose of self-preservation and does not become independent of them until later. No one who has seen a baby sinking back satiated from the breast and falling asleep with flushed cheeks and a blissful smile can escape the reflection that this picture persists as a prototype of the expression of sexual satisfaction in later life. The need for repeating the sexual satisfaction now becomes detached from the need for taking nourishment - a separation which becomes inevitable when the teeth appear and food is no longer taken in only by sucking, but is also chewed up. The child does not make use of an extraneous body for his sucking, but prefers a part of his own skin because it is more convenient, because it makes him independent of the external world, which he is not yet able to control, and because in that way he provides himself, as it were, with a second erotogenic zone, though one of an inferior kind. The inferiority of this second region is among the reasons why at a later date he seeks the corresponding part - the lips - of another person. ('It's a pity I can't kiss myself', he seems to be saying.)

It is not every child who sucks in this way. It may be assumed that those children do so in whom there is a constitutional intensification of the erotogenic significance of the labial region. If that significance persists, these same children when they are grown up will become epicures in kissing, will be inclined to perverse kissing, or, if males, will have a powerful motive for drinking and smoking. If, however, repression ensues, they will feel disgust at food and will produce hysterical vomiting. The repression extends to the nutritional instinct owing to the dual purpose served by the labial zone. Many of my women patients who suffer from disturbances of eating, *globus hystericus*, constriction of the throat and vomiting, have indulged energetically in sucking during their childhood.

Our study of thumb-sucking or sensual sucking has already given us the three essential characteristics of an infantile sexual manifestation. At its origin it attaches itself to one of the vital somatic functions; it has as yet no sexual object, and is thus auto-erotic; and its sexual aim is dominated by an erotogenic zone. It is to be anticipated that these characteristics will be found to apply equally to most of the other activities of the infantile sexual instincts.

¹ [Footnote added 1920:] Havelock Ellis, it is true, uses the word 'auto-erotic' in a somewhat different sense, to describe an excitation which is not provoked from outside but arises internally. What psycho-analysis regards as the essential point is not the genesis of the excitation, but the question of its relation to an object.

THE SEXUAL AIM OF INFANTILE SEXUALITY

CHARACTERISTICS OF EROTOGENIC ZONES The example of thumb-sucking shows us still more about what constitutes an erotogenic zone. It is a part of the skin or mucous membrane in which stimuli of a certain sort evoke a feeling of pleasure possessing a particular quality. There can be no doubt that the stimuli which produce the pleasure are governed by special conditions, though we do not know what those are. A rhythmic character must play a part among them and the analogy of tickling is forced upon our notice. It seems less certain whether the character of the pleasurable feeling evoked by the stimulus should be described as a 'specific' one - a 'specific' quality in which the sexual factor would precisely lie. Psychology is still so much in the dark in questions of pleasure and unpleasure that the most cautious assumption is the one most to be recommended. We may later come upon reasons which seem to support the idea that the pleasurable feeling does in fact possess a specific quality.

The character of erotogenicity can be attached to some parts of the body in a particularly marked way. There are predestined erotogenic zones, as is shown by the example of sucking. The same example, however, also shows us that any other part of the skin or mucous membrane can take over the functions of an erotogenic zone, and must therefore have some aptitude in that direction. Thus the quality of the stimulus has more to do with producing the pleasurable feeling than has the nature of the part of the body concerned. A child who is indulging in sensual sucking searches about his body and chooses some part of it to suck - a part which is afterwards preferred by him from force of habit; if he happens to hit upon one of the predestined regions (such as the nipples or genitals) no doubt it retains the preference. A precisely analogous tendency to displacement is also found in the symptomatology of hysteria. In that neurosis repression affects most of all the actual genital zones and these transmit their susceptibility to stimulation to other erotogenic zones (normally neglected in adult life), which then behave exactly like genitals. But besides this, precisely as in the case of sucking, any other part of the body can acquire the same susceptibility to stimulation as is possessed by the genitals and can become an erotogenic zone. Erotogenic and hysterogenic zones show the same characteristics.¹

¹ [*Footnote added 1915:*] After further reflection and after taking other observations into account, I have been led to ascribe the quality of erotogenicity to all parts of the body and to all the internal organs. Cf. also in this connection what is said below on narcissism.

THE INFANTILE SEXUAL AIM The sexual aim of the infantile instinct consists in obtaining satisfaction by means of an appropriate stimulation of the erotogenic zone which has been selected in one way or another. This satisfaction must have been previously experienced in order to have left behind a need for its repetition; and we may expect that Nature will have made safe provisions so that this experience of satisfaction shall not be left to chance.¹ We have already learnt what the contrivance is that fulfils this purpose in the case of the labial zone: it is the simultaneous connection which links this part of the body with the taking in of food. We shall come across other, similar contrivances as sources of sexuality. The state of being in need of a repetition of the satisfaction reveals itself in two ways: by a peculiar feeling of tension, possessing, rather, the character of unpleasure, and by a sensation of itching or stimulation which is centrally conditioned and projected on to the peripheral erotogenic zone. We can therefore formulate a sexual aim in another way: it consists in replacing the projected sensation of stimulation in the erotogenic zone by an external stimulus which removes that sensation by producing a feeling of satisfaction. This external stimulus will usually consist in some kind of manipulation that is analogous to the sucking.

The fact that the need can also be evoked peripherally, by a real modification of the erotogenic zone, is in complete harmony with our physiological knowledge. This strikes us as somewhat strange only because, in order to remove one stimulus, it seems necessary to adduce a second one at the same spot.

¹ [*Footnote added 1920:*] In biological discussions it is scarcely possible to avoid a teleological way of thinking, even though one is aware that in any particular instance one is not secure against error.

MASTURBATORY SEXUAL MANIFESTATIONS¹

It must come as a great relief to find that, when once we have understood the nature of the instinct arising from a single one of the erotogenic zones, we shall have very little more to learn of the sexual activity of children. The clearest distinctions as between one zone and another concern the nature of the contrivance necessary for satisfying the instinct; in the case of the labial zone it consisted of sucking, and this has to be replaced by other muscular actions according to the position and nature of the other zones.

ACTIVITY OF THE ANAL ZONE Like the labial zone, the anal zone is well suited by its position to act as a medium through which sexuality may attach itself to other somatic functions. It is to be presumed that the erotogenic significance of this part of the body is very great from the first. We learn with some astonishment from psycho-analysis of the transmutations normally undergone by the sexual excitations arising from this zone and of the frequency with which it retains a considerable amount of susceptibility to genital stimulation throughout life.² The intestinal disturbances which are so common in childhood see to it that the zone shall not lack intense excitations. Intestinal catarrhs at the tenderest age make children 'nervy', as people say, and in cases of later neurotic illness they have a determining influence on the symptoms in which the neurosis is expressed, and they put at its disposal the whole range of intestinal disturbances. If we bear in mind the erotogenic significance of the outlet of the intestinal canal, which persists, at all events in a modified form, we shall not be inclined to scoff at the influence of haemorrhoids, to which old-fashioned medicine used to attach so much importance in explaining neurotic conditions.

¹ Cf. the very copious literature on the subject of masturbation, which for the most part, however, is at sea upon the main issues, e.g. Rohleder (1899). [Added 1915:] See also the report of the discussion on the subject in the Vienna Psycho-Analytical Society (*Diskussionen*, 1912).

² [Footnote added 1910:] Cf. my papers on 'Character and Anal Erotism' (1908*b*) [added 1920:] and 'On Transformations of Instinct as Exemplified in Anal Erotism' (1917*c*).

Children who are making use of the susceptibility to erotogenic stimulation of the anal zone betray themselves by holding back their stool till its accumulation brings about violent muscular contractions and, as it passes through the anus, is able to produce powerful stimulation of the mucous membrane. In so doing it must no doubt cause not only painful but also highly pleasurable sensations. One of the clearest signs of subsequent eccentricity or nervousness is to be seen when a baby obstinately refuses to empty his bowels when he is put on the pot - that is, when his nurse wants him to - and holds back that function till he himself chooses to exercise it. He is naturally not concerned with dirtying the bed, he is only anxious not to miss the subsidiary pleasure attached to defaecating. Educators are once more right when they describe children who keep the process back as 'naughty'.

The contents of the bowels, which act as a stimulating mass upon a sexually sensitive portion of mucous membrane, behave like forerunners of another organ, which is destined to come into action after the phase of childhood. But they have other important meanings for the infant. They are clearly treated as a part of the infant's own body and represent his first 'gift': by producing them he can express his active compliance with his environment and, by withholding them, his disobedience. From being a 'gift' they later come to acquire the meaning of 'baby' - for babies, according to one of the sexual theories of children, are acquired by eating and are born through the bowels.

The retention of the faecal mass, which is thus carried out intentionally by the child to begin with, in order to serve, as it were, as a masturbatory stimulus upon the anal zone or to be employed in his relation to the people looking after him, is also one of the roots of the constipation which is so common among neuropaths. Further, the whole significance of the anal zone is reflected in the fact that few neurotics are to be found without their special scatological practices, ceremonies, and so on, which they carefully keep secret.¹

Actual masturbatory stimulation of the anal zone by means of the finger, provoked by a centrally determined or peripherally maintained sensation of itching, is by no means rare among older children.

¹ [Footnote added 1920:] Lou Andreas-Salomé (1916), in a paper which has given us a very much deeper understanding of the significance of anal erotism, has shown how the history of the first prohibition which a child comes across - the prohibition against getting pleasure from anal activity and its products - has a decisive effect on his whole development. This must be the first occasion on which the infant has a glimpse of an environment hostile to his instinctual impulses, on which he learns to separate his own entity from this alien one and on which he carries out the first 'repression' of his possibilities for pleasure. From that time on, what is 'anal' remains the symbol of everything that is to be repudiated and excluded from life. The clear-cut distinction between anal and genital processes which is later insisted upon is contradicted by the close anatomical and functional analogies and relations which hold between them. The genital apparatus remains the neighbour of the cloaca, and actually 'in the case of women is only taken from it on lease'.

ACTIVITY OF THE GENITAL ZONES Among the erotogenic zones that form part of the child's body there is one which certainly does not play the opening part, and which cannot be the vehicle of the oldest sexual impulses, but which is destined to great things in the future. In both male and female children it is brought into connection with micturition (in the glans and clitoris) and in the former is enclosed in a pouch of mucous membrane, so that there can be no lack of stimulation of it by secretions which may give an early start to sexual excitation. The sexual activities of this erotogenic zone, which forms part of the sexual organs proper, are the beginning of what is later to become 'normal' sexual life. The anatomical situation of this region, the secretions in which it is bathed, the washing and rubbing to which it is subjected in the course of a child's toilet, as well as accidental stimulation (such as the movement of intestinal worms in the case of girls), make it inevitable that the pleasurable feeling which this part of the body is capable of producing should be noticed by children even during their earliest infancy, and should give rise to a need for its repetition. If we consider this whole range of contrivances and bear in mind that both making a mess and measures for keeping clean are bound to operate in much the same way, it is scarcely possible to avoid the conclusion that the foundations for the future primacy over sexual activity exercised by this erotogenic zone are established by early infantile masturbation, which scarcely a single individual escapes. The action which disposes of the stimulus and brings about satisfaction consists in a rubbing movement with the hand or in the application of pressure (no doubt on the lines of a pre-existing reflex) either from the hand or by bringing the thighs together. This last method is by far the more common in the case of girls. The preference for the hand which is shown by boys is already evidence of the important contribution which the instinct for mastery is destined to make to masculine sexual activity.¹

It will be in the interests of clarity if I say at once that three phases of infantile masturbation are to be distinguished. The first of these belongs to early infancy, and the second to the brief efflorescence of sexual activity about the fourth year of life; only the third phase corresponds to pubertal masturbation, which is often the only kind taken into account.

¹ [*Footnote added 1915:*] Unusual techniques in carrying out masturbation in later years seem to point to the influence of a prohibition against masturbation which has been overcome.

SECOND PHASE OF INFANTILE MASTURBATION The masturbation of early infancy seems to disappear after a short time; but it may persist uninterruptedly until puberty, and this would constitute the first great deviation from the course of development laid down for civilized men. At some point of childhood after early infancy, as a rule before the fourth year, the sexual instinct belonging to the genital zone usually revives and persists again for a time until it is once more suppressed, or it may continue without interruption. This second phase of infantile sexual activity may assume a variety of different forms which can only be determined by a precise analysis of individual cases. But all its details leave behind the deepest (unconscious) impressions in the subject's memory, determine the development of his character, if he is to remain healthy, and the symptomatology of his neurosis, if he is to fall ill after puberty.¹ In the latter case we find that this sexual period has been forgotten and that the conscious memories that bear witness to it have been displaced. (I have already mentioned that I am also inclined to relate normal infantile amnesia to this infantile sexual activity.) Psycho-analytic investigation enables us to make what has been forgotten conscious and thus do away with a compulsion that arises from the unconscious psychical material.

¹ [*Footnote added 1915:*] The problem of why the sense of guilt of neurotics is, as Bleuler recently recognized, regularly attached to the memory of some masturbatory activity, usually at puberty, still awaits an exhaustive analytic explanation. [*Added 1920:*] The most general and most important factor concerned must no doubt be that masturbation represents the executive agency of the whole of infantile sexuality and is, therefore, able to take over the sense of guilt attaching to it.

RETURN OF EARLY INFANTILE MASTURBATION During the years of childhood with which I am now dealing, the sexual excitation of early infancy returns, either as a centrally determined tickling stimulus which seeks satisfaction in masturbation, or as a process in the nature of a nocturnal emission which, like the nocturnal emissions of adult years, achieves satisfaction without the help of any action by the subject. The latter case is the more frequent with girls and in the second half of childhood; its determinants are not entirely intelligible and often, though not invariably, it seems to be conditioned by a period of earlier *active* masturbation. The symptoms of these sexual manifestations are scanty; they are mostly displayed on behalf of the still undeveloped sexual apparatus by the *urinary* apparatus, which thus acts, as it were, as the former's trustee. Most of the so-called bladder disorders of this period are sexual disturbances: nocturnal enuresis, unless it represents an epileptic fit, corresponds to a nocturnal emission.

The reappearance of sexual activity is determined by internal causes and external contingencies, both of which can be guessed in cases of neurotic illness from the form taken by their symptoms and can be discovered with certainty by psycho-analytic investigation. I shall have to speak presently of the internal causes; great and lasting importance attaches at this period to the accidental *external* contingencies. In the foreground we find the effects of seduction, which treats a child as a sexual object prematurely and teaches him, in highly emotional circumstances, how to obtain satisfaction from his genital zones, a satisfaction which he is then usually obliged to repeat again and again by masturbation. An influence of this kind may originate either from adults or from other children. I cannot admit that in my paper on 'The Aetiology of Hysteria' (1896c) I exaggerated the frequency or importance of that influence, though I did not then know that persons who remain normal may have had the same experiences in their childhood, and though I consequently overrated the importance of seduction in comparison with the factors of sexual constitution and development.¹ Obviously seduction is not required in order to arouse a child's sexual life; that can also come about spontaneously from internal causes.

POLYMORPHOUSLY PERVERSE DISPOSITION It is an instructive fact that under the influence of seduction children can become polymorphously perverse, and can be led into all possible kinds of sexual irregularities. This shows that an aptitude for them is innately present in their disposition. There is consequently little resistance towards carrying them out, since the mental dams against sexual excesses - shame, disgust and morality - have either not yet been constructed at all or are only in course of construction, according to the age of the child. In this respect children behave in the same kind of way as an average uncultivated woman in whom the same polymorphously perverse disposition persists. Under ordinary conditions she may remain normal sexually, but if she is led on by a clever seducer she will find every sort of perversion to her taste, and will retain them as part of her own sexual activities. Prostitutes exploit the same polymorphous, that is, infantile, disposition for the purposes of their profession; and, considering the immense number of women who are prostitutes or who must be supposed to have an aptitude for prostitution without becoming engaged in it, it becomes impossible not to recognize that this same disposition to perversions of every kind is a general and fundamental human characteristic.

¹ Havelock Ellis has published a number of autobiographical narratives written by people who remained predominantly normal in later life and describing the first sexual impulses of their childhood and the occasions which gave rise to them. These reports naturally suffer from the fact that they omit the prehistoric period of the writers' sexual lives, which is veiled by infantile amnesia and which can only be filled in by psycho-analysis in the case of an individual who has developed a neurosis. In more than one respect, nevertheless, the statements are valuable, and similar narratives were what led me to make the modification in my aetiological hypotheses which I have mentioned in the text.

COMPONENT INSTINCTS Moreover, the effects of seduction do not help to reveal the early history of the sexual instinct; they rather confuse our view of it by presenting children prematurely with a sexual object for which the infantile sexual instinct at first shows no need. It must, however, be admitted that infantile sexual life, in spite of the preponderating dominance of erotogenic zones, exhibits components which from the very first involve other people as sexual objects. Such are the instincts of scopophilia, exhibitionism and cruelty, which appear in a sense independently of erotogenic zones; these instincts do not enter into intimate relations with genital life until later, but are already to be observed in childhood as independent impulses, distinct in the first instance from erotogenic sexual activity. Small children are essentially without shame, and at some periods of their earliest years show an unmistakable satisfaction in exposing their bodies, with especial emphasis on the sexual parts. The counterpart of this supposedly perverse inclination, curiosity to see other people's genitals, probably, does not become manifest until somewhat later in childhood, when the obstacle set up by a sense of shame has already reached a certain degree of development. Under the influence of seduction the scopophilic perversion can attain great importance in the sexual life of a child. But my researches into the early years of normal people, as well as of neurotic patients, force me to the conclusion that scopophilia can also appear in children as a spontaneous manifestation. Small children whose attention has once been drawn - as a rule by masturbation - to their own genitals usually take the further step without help from outside and develop a lively interest in the genitals of their playmates. Since opportunities for satisfying curiosity of this kind usually occur only in the course of satisfying the two kinds of need for excretion, children of this kind turn into *voyeurs*, eager spectators of the processes of micturition and defaecation. When repression of these inclinations sets in, the desire to see other people's genitals (whether of their own or the opposite sex) persists as a tormenting compulsion, which in some cases of neurosis later affords the strongest motive force for the formation of symptoms.

The cruel component of the sexual instinct develops in childhood even more independently of the sexual activities that are attached to erotogenic zones. Cruelty in general comes easily to the childish nature, since the obstacle that brings the instinct for mastery to a halt at another person's pain - namely a capacity for pity - is developed relatively late. The fundamental psychological analysis of this instinct has, as we know, not yet been satisfactorily achieved. It may be assumed that the impulse of cruelty arises from the instinct for mastery and appears at a period of sexual life at which the genitals have not yet taken over their later role. It then dominates a phase of sexual life which we shall later describe as a pregenital organization. Children who distinguish themselves by special cruelty towards animals and playmates usually give rise to a just suspicion of an intense and precocious sexual activity arising from erotogenic zones; and, though all the sexual instincts may display simultaneous precocity, *erotogenic* sexual activity seems, nevertheless, to be the primary one. The absence of the barrier of pity brings with it a danger that the connection between the cruel and the erotogenic instincts, thus established in childhood, may prove unbreakable in later life. Ever since Jean Jacques Rousseau's *Confessions*, it has been well known to all educationalists that the painful stimulation of the skin of the buttocks is one of the erotogenic roots of the *passive* instinct of cruelty (masochism). The conclusion has rightly been drawn by them that corporal punishment, which is usually applied to this part of the body, should not be inflicted upon any children whose libido is liable to be forced into collateral channels by the later demands of cultural education.¹

¹ [Footnote added 1910:] When the account which I have given above of infantile sexuality was first published in 1905, it was founded for the most part on the results of psycho-analytic research upon adults. At that time it was impossible to make full use of direct observation on children: only isolated hints and some valuable pieces of confirmation came from that source. Since then it has become possible to gain direct insight into infantile psycho-sexuality by the analysis of some cases of neurotic illness during the early years of childhood. It is gratifying to be able to report that direct observation has fully confirmed the conclusions arrived at by psycho-analysis - which is incidentally good evidence of the trustworthiness of that method of research. In addition to this, the 'Analysis of a Phobia in a Five-Year-Old Boy' (1909b) has taught us much that is new for which we have not been prepared by psycho-analysis: for instance, the fact that sexual symbolism - the representation of what is sexual by non-sexual objects and relations - extends back into the first years of possession of the power of speech.

I was further made aware of a defect in the account I have given in the text, which, in the interests of lucidity, describes the conceptual distinction between the two phases of auto-erotism and object-love as though it were also a separation in time. But the analyses that I have just mentioned, as well as the findings of Bell quoted on p. 1496 *n.*, above, show that children between the ages of three and five are capable of very clear object-choice, accompanied by strong affects.

THE SEXUAL RESEARCHES OF CHILDHOOD

THE INSTINCT FOR KNOWLEDGE At about the same time as the sexual life of children reaches its first peak, between the ages of three and five, they also begin to show signs of the activity which may be ascribed to the instinct for knowledge or research. This instinct cannot be counted among the elementary instinctual components, nor can it be classed as exclusively belonging to sexuality. Its activity corresponds on the one hand to a sublimated manner of obtaining mastery, while on the other hand it makes use of the energy of scopophilia. Its relations to sexual life, however, are of particular importance, since we have learnt from psycho-analysis that the instinct for knowledge in children is attracted unexpectedly early and intensively to sexual problems and is in fact possibly first aroused by them.

THE RIDDLE OF THE SPHINX It is not by theoretical interests but by practical ones that activities of research are set going in children. The threat to the bases of a child's existence offered by the discovery or the suspicion of the arrival of a new baby and the fear that he may, as a result of it, cease to be cared for and loved, make him thoughtful and clear-sighted. And this history of the instinct's origin is in line with the fact that the first problem with which it deals is not the question of the distinction between the sexes but the riddle of where babies come from. (This, in a distorted form which can easily be rectified, is the same riddle that was propounded by the Theban Sphinx.) On the contrary, the existence of two sexes does not to begin with arouse any difficulties or doubts in children. It is self-evident to a male child that a genital like his own is to be attributed to everyone he knows, and he cannot make its absence tally with his picture of these other people.

CASTRATION COMPLEX AND PENIS ENVY This conviction is energetically maintained by boys, is obstinately defended against the contradictions which soon result from observation, and is only abandoned after severe internal struggles (the castration complex). The substitutes for this penis which they feel is missing in women play a great part in determining the form taken by many perversions.¹

The assumption that all human beings have the same (male) form of genital is the first of the many remarkable and momentous sexual theories of children. It is of little use to a child that the science of biology justifies his prejudice and has been obliged to recognize the female clitoris as a true substitute for the penis.

Little girls do not resort to denial of this kind when they see that boys' genitals are formed differently from their own. They are ready to recognize them immediately and are overcome by envy for the penis - an envy culminating in the wish, which is so important in its consequences, to be boys themselves.

¹ [*Footnote added 1920:*] We are justified in speaking of a castration complex in women as well. Both male and female children form a theory that women no less than men originally had a penis, but that they have lost it by castration. The conviction which is finally reached by males that women have no penis often leads them to an enduringly low opinion of the other sex.

THEORIES OF BIRTH Many people can remember clearly what an intense interest they took during the prepubertal period in the question of where babies come from. The anatomical answers to the question were at the time very various: babies come out of the breast, or are cut out of the body, or the navel opens to let them through.¹ Outside analysis, there are very seldom memories of any similar researches having been carried out in the early years of childhood. These earlier researches fell a victim to repression long since, but all their findings were of a uniform nature: people get babies by eating some particular thing (as they do in fairy tales) and babies are born through the bowel like a discharge of faeces. These infantile theories remind us of conditions that exist in the animal kingdom - and especially of the cloaca in types of animals lower than mammals.

SADISTIC VIEW OF SEXUAL INTERCOURSE If children at this early age witness sexual intercourse between adults - for which an opportunity is provided by the conviction of grown-up people that small children cannot understand anything sexual - they inevitably regard the sexual act as a sort of ill-treatment or act of subjugation: they view it, that is, in a sadistic sense. Psycho-analysis also shows us that an impression of this kind in early childhood contributes a great deal towards a predisposition to a subsequent sadistic displacement of the sexual aim. Furthermore, children are much concerned with the problem of what sexual intercourse - or, as they put it, being married - consists in: and they usually seek a solution of the mystery in some common activity concerned with the function of micturition or defaecation.

TYPICAL FAILURE OF INFANTILE SEXUAL RESEARCHES We can say in general of the sexual theories of children that they are reflections of their own sexual constitution, and that in spite of their grotesque errors the theories show more understanding of sexual processes than one would have given their creators credit for. Children also perceive the alterations that take place in their mother owing to pregnancy and are able to interpret them correctly. The fable of the stork is often told to an audience that receives it with deep, though mostly silent, mistrust. There are, however, two elements that remain undiscovered by the sexual researches of children: the fertilizing role of semen and the existence of the female sexual orifice - the same elements, incidentally, in which the infantile organization is itself undeveloped. It therefore follows that the efforts of the childish investigator are habitually fruitless, and end in a renunciation which not infrequently leaves behind it a permanent injury to the instinct for knowledge. The sexual researches of these early years of childhood are always carried out in solitude. They constitute a first step towards taking an independent attitude in the world, and imply a high degree of alienation of the child from the people in his environment who formerly enjoyed his complete confidence.

¹ [Footnote added 1924:] In these later years of childhood there is a great wealth of sexual theories, of which only a few examples are given in the text.

THE PHASES OF DEVELOPMENT OF THE SEXUAL ORGANIZATION

The characteristics of infantile sexual life which we have hitherto emphasized are the facts that it is essentially auto-erotic (i.e. that it finds its object in the infant's own body) and that its individual component instincts are upon the whole disconnected and independent of one another in their search for pleasure. The final outcome of sexual development lies in what is known as the normal sexual life of the adult, in which the pursuit of pleasure comes under the sway of the reproductive function and in which the component instincts, under the primacy of a single erotogenic zone, form a firm organization directed towards a sexual aim attached to some extraneous sexual object.

PREGENITAL ORGANIZATIONS The study, with the help of psycho-analysis, of the inhibitions and disturbances of this process of development enables us to recognize abortive beginnings and preliminary stages of a firm organization of the component instincts such as this - preliminary stages which themselves constitute a sexual regime of a sort. These phases of sexual organization are normally passed through smoothly, without giving more than a hint of their existence. It is only in pathological cases that they become active and recognizable to superficial observation.

We shall give the name of 'pregenital' to organizations of sexual life in which the genital zones have not yet taken over their predominant part. We have hitherto identified two such organizations, which almost seem as though they were harking back to early animal forms of life.

The first of these is the oral or, as it might be called, cannibalistic pregenital sexual organization. Here sexual activity has not yet been separated from the ingestion of food; nor are opposite currents within the activity differentiated. The *object* of both activities is the same; the sexual *aim* consists in the incorporation of the object - the prototype of a process which, in the form of identification, is later to play such an important psychological part. A relic of this constructed phase of organization, which is forced upon our notice by pathology, may be seen in thumb-sucking, in which the sexual activity, detached from the nutritive activity, has substituted for the extraneous object one situated in the subject's own body.¹

A second pregenital phase is that of the sadistic-anal organization. Here the opposition between two currents, which runs through all sexual life, is already developed: they cannot yet, however, be described as 'masculine' and 'feminine', but only as 'active' and 'passive'. The *activity* is put into operation by the instinct for mastery through the agency of the somatic musculature; the organ which, more than any other, represents the *passive* sexual aim is the erotogenic mucous membrane of the anus. Both of these currents have objects, which, however, are not identical. Alongside these, other component instincts operate in an auto-erotic manner. In this phase, therefore, sexual polarity and an extraneous object are already observable. But organization and subordination to the reproductive function are still absent.²

¹ [Footnote added 1920:] For remnants of this phase in adult neurotics, cf. Abraham (1916). [Added 1924:] In another, later work (1924) the same writer has divided both this oral phase, and also the later sadistic anal one, into two subdivisions, which are characterized by differing attitudes towards the object.

² [Footnote added 1924:] Abraham, in the paper last quoted (1924), points out that the anus is developed from the embryonic blastopore - a fact which seems like a biological prototype of psychosexual development.

AMBIVALENCE This form of sexual organization can persist throughout life and can permanently attract a large portion of sexual activity to itself. The predominance in it of sadism and the cloacal part played by the anal zone give it a quite peculiarly archaic colouring. It is further characterized by the fact that in it the opposing pairs of instincts are developed to an approximately equal extent, a state of affairs described by Bleuler's happily chosen term 'ambivalence'.

The assumption of the existence of pregenital organizations of sexual life is based on the analysis of the neuroses, and without a knowledge of them can scarcely be appreciated. Further analytic investigation may be expected to provide us with far more information on the structure and development of the normal sexual function.

In order to complete our picture of infantile sexual life, we must also suppose that the choice of an object, such as we have shown to be characteristic of the pubertal phase of development, has already frequently or habitually been effected during the years of childhood: that is to say, the whole of the sexual currents have become directed towards a single person in relation to whom they seek to achieve their aims. This then is the closest approximation possible in childhood to the final form taken by sexual life after puberty. The only difference lies in the fact that in childhood the combination of the component instincts and their subordination under the primacy of the genitals have been effected only very incompletely or not at all. Thus the establishment of that primacy in the service of reproduction is the last phase through which the organization of sexuality passes.¹

¹ [Footnote added 1924:] At a later date (1923), I myself modified this account by inserting a third phase in the development of childhood, subsequent to the two pregenital organizations. This phase, which already deserves to be described as genital, presents a sexual object and some degree of convergence of the sexual impulses upon that object; but it is differentiated from the final organization of sexual maturity in one essential respect. For it knows only one kind of genital: the male one. For that reason I have named it the 'phallic' stage of organization. (Freud, 1923e.) According to Abraham, it has a biological prototype in the embryo's undifferentiated genital disposition, which is the same for both sexes.

DIPHASIC CHOICE OF OBJECT It may be regarded as typical of the choice of an object that the process is diphasic, that is, that it occurs in two waves. The first of these begins between the ages of two and five, and is brought to a halt or to a retreat by the latency period; it is characterized by the infantile nature of the sexual aims. The second wave sets in with puberty and determines the final outcome of sexual life.

Although the diphasic nature of object-choice comes down in essentials to no more than the operation of the latency period, it is of the highest importance in regard to disturbances of that final outcome. The resultants of infantile object-choice are carried over into the later period. They either persist as such or are revived at the actual time of puberty. But as a consequence of the repression which has developed between the two phases they prove unutilizable. Their sexual aims have become mitigated and they now represent what may be described as the 'affectionate current' of sexual life. Only psycho-analytic investigation can show that behind this affection, admiration and respect there lie concealed the old sexual longings of the infantile component instincts which have now become unserviceable. The object-choice of the pubertal period is obliged to dispense with the objects of childhood and to start afresh as a 'sensual current'. Should these two currents fail to converge, the result is often that one of the ideals of sexual life, the focusing of all desires upon a single object, will be unattainable.

THE SOURCES OF INFANTILE SEXUALITY

Our efforts to trace the origins of the sexual instinct have shown us so far that sexual excitation arises (*a*) as a reproduction of a satisfaction experienced in connection with other organic processes, (*b*) through appropriate peripheral stimulation of erotogenic zones and (*c*) as an expression of certain 'instincts' (such as the scopophilic instinct and the instinct of cruelty) of which the origin is not yet completely intelligible. Psycho-analytic investigation, reaching back into childhood from a later time, and contemporary observation of children combine to indicate to us still other regularly active sources of sexual excitation. The direct observation of children has the disadvantage of working upon data which are easily misunderstandable; psycho-analysis is made difficult by the fact that it can only reach its data, as well as its conclusions, after long detours. But by co-operation the two methods can attain a satisfactory degree of certainty in their findings.

We have already discovered in examining the erotogenic zones that these regions of the skin merely show a special intensification of a kind of susceptibility to stimulus which is possessed in a certain degree by the whole cutaneous surface. We shall therefore not be surprised to find that very definite erotogenic effects are to be ascribed to certain kinds of general stimulation of the skin. Among these we may especially mention thermal stimuli, whose importance may help us to understand the therapeutic effects of warm baths.

MECHANICAL EXCITATIONS At this point we must also mention the production of sexual excitation by rhythmic mechanical agitation of the body. Stimuli of this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of these pleasurable sensations - and it is worth emphasizing the fact that in this connection the concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction, a circumstance which we must later endeavour to explain - the existence, then, of these pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by the fact that children are so fond of games of passive movement, such as swinging and being thrown up into the air, and insist on such games being incessantly repeated.¹ It is well known that rocking is habitually used to induce sleep in restless children. The shaking produced by driving in carriages and later by railway-travel exercises such a fascinating effect upon older children that every boy, at any rate, has at one time or other in his life wanted to be an engine driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest in things connected with railways, and, at the age at which the production of phantasies is most active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly sexual. A compulsive link of this kind between railway-travel and sexuality is clearly derived from the pleasurable character of the sensations of movement. In the event of repression, which turns so many childish preferences into their opposite, these same individuals, when they are adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will protect themselves against a repetition of the painful experience by a dread of railway-travel.

Here again we must mention the fact, which is not yet understood, that the combination of fright and mechanical agitation produces the severe, hysteriform, traumatic neurosis. It may at least be assumed that these influences, which, when they are of small intensity, become sources of sexual excitation, lead to a profound disorder in the sexual mechanism or chemistry if they operate with exaggerated force.

¹ Some people can remember that in swinging they felt the impact of moving air upon their genitals as an immediate sexual pleasure.

MUSCULAR ACTIVITY We are all familiar with the fact that children feel a need for a large amount of active muscular exercise and derive extraordinary pleasure from satisfying it. Whether this pleasure has any connection with sexuality, whether it itself comprises sexual satisfaction or whether it can become the occasion of sexual excitation - all of this is open to critical questioning, which may indeed also be directed against the view maintained in the previous paragraphs that the pleasure derived from sensations of *passive* movement is of a sexual nature or may produce sexual excitation. It is, however, a fact that a number of people report that they experienced the first signs of excitement in their genitals while they were romping or wrestling with playmates - a situation in which, apart from general muscular exertion, there is a large amount of contact with the skin of the opponent. An inclination to physical struggles with some one particular person, just as in later years an inclination to *verbal* disputes,¹ is a convincing sign that object-choice has fallen on him. One of the roots of the sadistic instinct would seem to lie in the encouragement of sexual excitation by muscular activity. In many people the infantile connection between romping and sexual excitation is among the determinants of the direction subsequently taken by their sexual instinct.²

AFFECTIVE PROCESSES The further sources of sexual excitation in children are open to less doubt. It is easy to establish, whether by contemporary observation or by subsequent research, that all comparatively intense affective processes, including even terrifying ones, trench upon sexuality - a fact which may incidentally help to explain the pathogenic effect of emotions of that kind. In schoolchildren dread of going in for an examination or tension over a difficult piece of work can be important not only in affecting the child's relations at school but also in bringing about an irruption of sexual manifestations. For quite often in such circumstances a stimulus may be felt which urges the child to touch his genitals, or something may take place akin to a nocturnal emission with all its bewildering consequences. The behaviour of children at school, which confronts a teacher with plenty of puzzles, deserves in general to be brought into relation with their budding sexuality. The sexually exciting effect of many emotions which are in themselves unpleasurable, such as feelings of apprehension, fright or horror, persists in a great number of people throughout their adult life. There is no doubt that this is the explanation of why so many people seek opportunities for sensations of this kind, subject to the proviso that the seriousness of the unpleasurable feeling is damped down by certain qualifying facts, such as its occurring in an imaginary world, in a book or in a play.

If we assume that a similar erotogenic effect attaches even to intensely painful feelings, especially when the pain is toned down or kept at a distance by some accompanying condition, we should here have one of the main roots of the masochistic-sadistic instinct, into whose numerous complexities we are very gradually gaining some insight.³

INTELLECTUAL WORK Finally, it is an unmistakable fact that concentration of the attention upon an intellectual task and intellectual strain in general produce a concomitant sexual excitation in many young people as well as adults. This is no doubt the only justifiable basis for what is in other respects the questionable practice of ascribing nervous disorders to intellectual 'overwork'.

¹ 'Was sich liebt, das neckt sich.' [Lovers' quarrels are proverbial.]

² [Footnote added 1910:] The analysis of cases of neurotic abasia and agoraphobia removes all doubt as to the sexual nature of pleasure in movement. Modern education, as we know, makes great use of games in order to divert young people from sexual activity. It would be more correct to say that in these young people it replaces sexual enjoyment by pleasure in movement - and forces sexual activity back to one of its auto-erotic components.

³ [Footnote added 1924:] I am here referring to what is known as 'erotogenic' masochism.

If we now cast our eyes over the tentative suggestions which I have made as to the sources of infantile sexual excitation, though I have not described them completely nor enumerated them fully, the following conclusions emerge with more or less certainty. It seems that the fullest provisions are made for setting in motion the process of sexual excitation - a process the nature of which has, it must be confessed, become highly obscure to us. The setting in motion of this process is first and foremost provided for in a more or less direct fashion by the excitations of the sensory surfaces - the skin and the sense organs - and, most directly of all, by the operation of stimuli on certain areas known as erotogenic zones. The decisive element in these sources of sexual excitation is no doubt the *quality* of the stimuli, though the factor of intensity, in the case of pain, is not a matter of complete indifference. But apart from these sources there are present in the organism contrivances which bring it about that in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits. What we have called the component instincts of sexuality are either derived directly from these internal sources or are composed of elements both from those sources and from the erotogenic zones. It may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual instinct.

It does not seem to me possible at present to state these general conclusions with any greater clarity or certainty. For this I think two factors are responsible: first, the novelty of the whole method of approach to the subject, and secondly, the fact that the whole nature of sexual excitation is completely unknown to us. Nevertheless I am tempted to make two observations which promise to open out wide future prospects:

VARIETIES OF SEXUAL CONSTITUTION (a) Just as we saw previously that it was possible to derive a multiplicity of innate sexual constitutions from variety in the development of the erotogenic zones, so we can now make a similar attempt by including the *indirect* sources of sexual excitation. It may be assumed that, although contributions are made from these sources in the case of everyone, they are not in all cases of equal strength, and that further help towards the differentiation of sexual constitutions may be found in the varying development of the individual sources of sexual excitation.¹

PATHWAYS OF MUTUAL INFLUENCE (b) If we now drop the figurative expression that we have so long adopted in speaking of the 'sources' of sexual excitation, we are led to the suspicion that all the connecting pathways that lead from other functions to sexuality must also be traversable in the reverse direction. If, for instance, the common possession of the labial zone by the two functions is the reason why sexual satisfaction arises during the taking of nourishment, then the same factor also enables us to understand why there should be disorders of nutrition if the erotogenic functions of the common zone are disturbed. Or again, if we know that concentration of attention may give rise to sexual excitation, it seems plausible to assume that by making use of the same path, but in a contrary direction, the condition of sexual excitation may influence the possibility of directing the attention. A good portion of the symptomatology of the neuroses, which I have traced to disturbances of the sexual processes, is expressed in disturbances of other, non-sexual, somatic functions; and this circumstance, which has hitherto been unintelligible, becomes less puzzling if it is only the counterpart of the influences which bring about the production of sexual excitation.

The same pathways, however, along which sexual disturbances trench upon the other somatic functions must also perform another important function in normal health. They must serve as paths for the attraction of sexual instinctual forces to aims that are other than sexual, that is to say, for the sublimation of sexuality. But we must end with a confession that very little is as yet known with certainty of these pathways, though they certainly exist and can probably be traversed in both directions.

¹ [Footnote added 1920:] An inevitable consequence of these considerations is that we must regard each individual as possessing an oral erotism, an anal erotism, a urethral erotism, etc., and that the existence of mental complexes corresponding to these implies no judgement of abnormality or neurosis. The differences separating the normal from the abnormal can lie only in the relative strength of the individual components of the sexual instinct and in the use to which they are put in the course of development.

III

THE TRANSFORMATIONS OF PUBERTY

With the arrival of puberty, changes set in which are destined to give infantile sexual life its final, normal shape. The sexual instinct has hitherto been predominantly auto-erotic; it now finds a sexual object. Its activity has hitherto been derived from a number of separate instincts and erotogenic zones, which, independently of one another, have pursued a certain sort of pleasure as their sole sexual aim. Now, however, a new sexual aim appears, and all the component instincts combine to attain it, while the erotogenic zones become subordinated to the primacy of the genital zone.¹ Since the new sexual aim assigns very different functions to the two sexes, their sexual development now diverges greatly. That of males is the more straightforward and the more understandable, while that of females actually enters upon a kind of involution. A normal sexual life is only assured by an exact convergence of the two currents directed towards the sexual object and sexual aim, the affectionate current and the sensual one. (The former, the affectionate current, comprises what remains over of the infantile efflorescence of sexuality.) It is like the completion of a tunnel which has been driven through a hill from both directions.

The new sexual aim in men consists in the discharge of the sexual products. The earlier one, the attainment of pleasure, is by no means alien to it; on the contrary, the highest degree of pleasure is attached to this final act of the sexual process. The sexual instinct is now subordinated to the reproductive function; it becomes, so to say, altruistic. If this transformation is to succeed, the original dispositions and all the other characteristics of the instincts must be taken into account in the process. Just as on any other occasion on which the organism should by rights make new combinations and adjustments leading to complicated mechanisms, here too there are possibilities of pathological disorders if these new arrangements are not carried out. Every pathological disorder of sexual life is rightly to be regarded as an inhibition in development.

¹ [*Footnote added 1915:*] The schematic picture which I have given in the text aims at emphasizing differences. I have already shown on p. 1517 the extent to which infantile sexuality, owing to its choice of object [*added 1924:*] and to the development of the phallic phase, approximates to the final sexual organization.

THE PRIMACY OF THE GENITAL ZONES AND FORE-PLEASURE

The starting-point and the final aim of the process which I have described are clearly visible. The intermediate steps are still in many ways obscure to us. We shall have to leave more than one of them as an unsolved riddle.

The most striking of the processes at puberty has been picked upon as constituting its essence: the manifest growth of the external genitalia. (The latency period of childhood is, on the other hand, characterized by a relative cessation of their growth.) In the meantime the development of the internal genitalia has advanced far enough for them to be able to discharge the sexual products or, as the case may be, to bring about the formation of a new living organism. Thus a highly complicated apparatus has been made ready and awaits the moment of being put into operation.

This apparatus is to be set in motion by stimuli, and observation shows us that stimuli can impinge on it from three directions: from the external world by means of the excitation of the erotogenic zones with which we are already familiar, from the organic interior by ways which we have still to explore, and from mental life, which is itself a storehouse for external impressions and a receiving-post for internal excitations. All three kinds of stimuli produce the same effect, namely a condition described as 'sexual excitement', which shows itself by two sorts of indication, mental and somatic. The mental indications consist in a peculiar feeling of tension of an extremely compelling character; and among the numerous somatic ones are first and foremost a number of changes in the genitals, which have the obvious sense of being preparations for the sexual act - the erection of the male organ and the lubrication of the vagina.

SEXUAL TENSION The fact that sexual excitement possesses the character of tension raises a problem the solution of which is no less difficult than it would be important in helping us to understand the sexual processes. In spite of all the differences of opinion that reign on the subject among psychologists, I must insist that a feeling of tension necessarily involve unpleasure. What seems to me decisive is the fact that a feeling of this kind is accompanied by an impulsion to make a change in the psychological situation, that it operates in an urgent way which is wholly alien to the nature of the feeling of pleasure. If, however, the tension of sexual excitement is counted as an unpleasurable feeling, we are at once brought up against the fact that it is also undoubtedly felt as pleasurable. In every case in which tension is produced by sexual processes it is accompanied by pleasure; even in the preparatory changes in the genitals a feeling of satisfaction of some kind is plainly to be observed. How, then, are this unpleasurable tension and this feeling of pleasure to be reconciled?

Everything relating to the problem of pleasure and unpleasure touches upon one of the sorest spots of present-day psychology. It will be my aim to learn as much as possible from the circumstances of the instance with which we are at present dealing, but I shall avoid any approach to the problem as a whole.¹

Let us begin by casting a glance at the way in which the erotogenic zones fit themselves into the new arrangement. They have to play an important part in introducing sexual excitation. The eye is perhaps the zone most remote from the sexual object, but it is the one which, in the situation of wooing an object, is liable to be the most frequently stimulated by the particular quality of excitation whose cause, when it occurs in a sexual object, we describe as beauty. (For the same reason the merits of a sexual object are described as 'attractions'.) This stimulation is on the one hand already accompanied by pleasure, while on the other hand it leads to an increase of sexual excitement or produces it if it is not yet present. If the excitation now spreads to another erotogenic zone - to the hand, for instance, through tactile sensations - the effect is the same: a feeling of pleasure on the one side, which is quickly intensified by pleasure arising from the preparatory changes, and on the other side an increase of sexual tension, which soon passes over into the most obvious unpleasure if it cannot be met by a further accession of pleasure. Another instance will perhaps make this even clearer. If an erotogenic zone in a person who is not sexually excited (e.g. the skin of a woman's breast) is stimulated by touch, the contact produces a pleasurable feeling; but it is at the same time better calculated than anything to arouse a sexual excitation that demands an increase of pleasure. The problem is how it can come about that an experience of pleasure can give rise to a need for greater pleasure.

¹ [Footnote added 1924:] I have made an attempt at solving this problem in the first part of my paper on 'The Economic Problem of Masochism' (1924c).

THE MECHANISM OF FORE-PLEASURE The part played in this by the erotogenic zones, however, is clear. What is true of one of them is true of all. They are all used to provide a certain amount of pleasure by being stimulated in the way appropriate to them. This pleasure then leads to an increase in tension which in its turn is responsible for producing the necessary motor energy for the conclusion of the sexual act. The penultimate stage of that act is once again the appropriate stimulation of an erotogenic zone (the genital zone itself, in the glans penis) by the appropriate object (the mucous membrane of the vagina); and from the pleasure yielded by this excitation the motor energy is obtained, this time by a reflex path, which brings about the discharge of the sexual substances. This last pleasure is the highest in intensity, and its mechanism differs from that of the earlier pleasure. It is brought about entirely by discharge: it is wholly a pleasure of satisfaction and with it the tension of the libido is for the time being extinguished.

This distinction between the one kind of pleasure due to the excitation of erotogenic zones and the other kind due to the discharge of the sexual substances deserves, I think, to be made more concrete by a difference in nomenclature. The former may be suitably described as 'fore-pleasure' in contrast to the 'end-pleasure' or pleasure of satisfaction derived from the sexual act. Fore-pleasure is thus the same pleasure that has already been produced, although on a smaller scale, by the infantile sexual instinct; end-pleasure is something new and is thus probably conditioned by circumstances that do not arise till puberty. The formula for the new function of the erotogenic zones runs therefore: they are used to make possible, through the medium of the fore-pleasure which can be derived from them (as it was during infantile life), the production of the greater pleasure of satisfaction.

I was able recently to throw light upon another instance, in a quite different department of mental life, of a slight feeling of pleasure similarly making possible the attainment of a greater resultant pleasure, and thus operating as an 'incentive bonus'. In the same connection I was also able to go more deeply into the nature of pleasure.¹

¹ See my volume on *Jokes and their Relation to the Unconscious* which appeared in 1905. The 'fore-pleasure' attained by the technique of joking is used in order to liberate a greater pleasure derived from the removal of internal inhibitions.

DANGERS OF FORE-PLEASURE The connection between fore-pleasure and infantile sexual life is, however, made clearer by the pathogenic part which it can come to play. The attainment of the normal sexual aim can clearly be endangered by the mechanism in which fore-pleasure is involved. This danger arises if at any point in the preparatory sexual processes the fore-pleasure turns out to be too great and the element of tension too small. The motive for proceeding further with the sexual process then disappears, the whole path is cut short, and the preparatory act in question takes the place of the normal sexual aim. Experience has shown that the precondition for this damaging event is that the erotogenic zone concerned or the corresponding component instinct shall already during childhood have contributed an unusual amount of pleasure. If further factors then come into play, tending to bring about a fixation, a compulsion may easily arise in later life which resists the incorporation of this particular fore-pleasure into a new context. Such is in fact the mechanism of many perversions, which consist in a lingering over the preparatory acts of the sexual process.

This failure of the function of the sexual mechanism owing to fore-pleasure is best avoided if the primacy of the genitals too is adumbrated in childhood; and indeed things seem actually arranged to bring this about in the second half of childhood (from the age of eight to puberty). During these years the genital zones already behave in much the same way as in maturity; they become the seat of sensations of excitation and of preparatory changes whenever any pleasure is felt from the satisfaction of other erotogenic zones, though this result is still without a purpose - that is to say, contributes nothing to a continuation of the sexual process. Already in childhood, therefore, alongside of the pleasure of satisfaction there is a certain amount of sexual tension, although it is less constant and less in quantity. We can now understand why, in discussing the sources of sexuality, we were equally justified in saying of a given process that it was sexually satisfying or sexually exciting. It will be noticed that in the course of our enquiry we began by exaggerating the distinction between infantile and mature sexual life, and that we are now setting this right. Not only the deviations from normal sexual life but its normal form as well are determined by the infantile manifestations of sexuality.

THE PROBLEM OF SEXUAL EXCITATION

We remain in complete ignorance both of the origin and of the nature of the sexual tension which arises simultaneously with the pleasure when erotogenic zones are satisfied.¹ The most obvious explanation, that this tension arises in some way out of the pleasure itself, is not only extremely improbable in itself but becomes untenable when we consider that in connection with the greatest pleasure of all, that which accompanies the discharge of the sexual products, no tension is produced, but on the contrary all tension is removed. Thus pleasure and sexual tension can only be connected in an indirect manner.

PART PLAYED BY THE SEXUAL SUBSTANCES Apart from the fact that normally it is only the discharge of the sexual substances that brings sexual excitation to an end, there are other points of contact between sexual tension and the sexual products. In the case of a man living a continent life, the sexual apparatus, at varying intervals, which, however, are not ungoverned by rules, discharges the sexual substances during the night, to the accompaniment of a pleasurable feeling and in the course of a dream which hallucinates a sexual act. And in regard to this process (nocturnal emission) it is difficult to avoid the conclusion that the sexual tension, which succeeds in making use of the short cut of hallucination as a substitute for the act itself, is a function of the accumulation of semen in the vesicles containing the sexual products. Our experience in connection with the exhaustibility of the sexual mechanism argues in the same sense. If the store of semen is exhausted, not only is it impossible to carry out the sexual act, but the susceptibility of the erotogenic zones to stimulus ceases, and their appropriate excitation no longer gives rise to any pleasure. We thus learn incidentally that a certain degree of sexual tension is required even for the excitability of the erotogenic zones.

This would seem to lead to what is, if I am not mistaken, the fairly wide-spread hypothesis that the accumulation of the sexual substances creates and maintains sexual tension; the pressure of these products upon the walls of the vesicles containing them might be supposed to act as a stimulus upon a spinal centre, the condition of which would be perceived by higher centres and would then give rise in consciousness to the familiar sensation of tension. If the excitation of the erotogenic zones increases sexual tension, this could only come about on the supposition that the zones in question are in an anatomical connection that has already been laid down with these centres, that they increase the tonus of the excitation in them, and, if the sexual tension is sufficient, set the sexual act in motion or, if it is insufficient, stimulate the production of the sexual substances.

The weakness of this theory, which we find accepted, for instance, in Krafft-Ebing's account of the sexual processes, lies in the fact that, having been designed to account for the sexual activity of adult males, it takes too little account of three sets of conditions which it should also be able to explain. These are the conditions in children, in females and in castrated males. In none of these three cases can there be any question of an accumulation of sexual products in the same sense as in males, and this makes a smooth application of the theory difficult. Nevertheless it may at once be admitted that it is possible to find means by which the theory may be made to cover these cases as well. In any case we are warned not to lay more weight on the factor of the accumulation of the sexual products than it is able to bear.

¹ It is a highly instructive fact that the German language in its use of the word '*Lust*' takes into account the part played by the preparatory sexual excitations which, as has been explained above, simultaneously produce an element of satisfaction and a contribution to sexual tension. '*Lust*' has two meanings, and is used to describe the sensation of sexual tension ('*Ich habe Lust*' = 'I should like to', 'I feel an impulse to') as well as the feeling of satisfaction.

IMPORTANCE OF THE INTERNAL SEXUAL ORGANS Observations on castrated males seem to show that sexual excitation can occur to a considerable degree independently of the production of the sexual substances. The operation of castration occasionally fails to bring about a limitation of libido, although such limitation, which provides the motive for the operation, is the usual outcome. Moreover, it has long been known that diseases which abolish the production of the masculine sex-cells leave the patient, though he is now sterile, with his libido and potency undamaged. It is therefore by no means as astonishing as Rieger represents it to be that the loss of the masculine sex-glands in an adult may have no further effect upon his mental behaviour. It is true that if castration is performed at a tender age, before puberty, it approximates in its effect to the aim of obliterating the sexual characters; but here too it is possible that what is in question is, besides the actual loss of the sex-glands, an inhibition (connected with that loss) in the development of other factors.

CHEMICAL THEORY Experiments in the removal of the sex-glands (testes and ovaries) of animals, and in the grafting into vertebrates of sex-glands from other individuals of the opposite sex,¹ have at last thrown a partial light on the origin of sexual excitation, and have at the same time still further reduced the significance of a possible accumulation of cellular sexual products. It has become experimentally possible (E. Steinach) to transform a male into a female, and conversely a female into a male. In this process the psychosexual behaviour of the animal alters in accordance with the somatic sexual characters and simultaneously with them. It seems, however, that this sex-determining influence is not an attribute of that part of the sex-glands which gives rise to the specific sex-cells (spermatozoa and ovum) but of their interstitial tissue, upon which special emphasis is laid by being described in the literature as the 'puberty-gland'. It is quite possible that further investigation will show that this puberty-gland has normally a hermaphrodite disposition. If this were so, the theory of the bisexuality of the higher animals would be given anatomical foundation. It is already probable that the puberty-gland is not the only organ concerned with the production of sexual excitation and sexual characters. In any case, what we already know of the part played by the thyroid gland in sexuality fits in with this new biological discovery. It seems probable, then, that special chemical substances are produced in the interstitial portion of the sex-glands; these are then taken up in the blood stream and cause particular parts of the central nervous system to be charged with sexual tension. (We are already familiar with the fact that other toxic substances, introduced into the body from outside, can bring about a similar transformation of a toxic condition into a stimulus acting on a particular organ.) The question of how sexual excitation arises from the stimulation of erotogenic zones, when the central apparatus has been previously charged, and the question of what interplay arises in the course of these sexual processes between the effects of purely toxic stimuli and of physiological ones - none of this can be treated, even hypothetically, in the present state of our knowledge. It must suffice us to hold firmly to what is essential in this view of the sexual processes: the assumption that substances of a peculiar kind arise from the sexual metabolism. For this apparently arbitrary supposition is supported by a fact which has received little attention but deserves the closest consideration. The neuroses, which can be derived only from disturbances of sexual life, show the greatest clinical similarity to the phenomena of intoxication and abstinence that arise from the habitual use of toxic, pleasure-producing substances (alkaloids).

¹ Cf. Lipschütz's work (1919), referred to on p. 1474 *n*.

THE LIBIDO THEORY

The conceptual scaffolding which we have set up to help us in dealing with the psychical manifestations of sexual life tallies well with these hypotheses as to the chemical basis of sexual excitation. We have defined the concept of libido as a quantitatively variable force which could serve as a measure of processes and transformations occurring in the field of sexual excitation. We distinguish this libido in respect of its special origin from the energy which must be supposed to underlie mental processes in general, and we thus also attribute a *qualitative* character to it. In thus distinguishing between libidinal and other forms of psychical energy we are giving expression to the presumption that the sexual processes occurring in the organism are distinguished from the nutritive processes by a special chemistry. The analysis of the perversions and psychoneuroses has shown us that this sexual excitation is derived not from the so-called sexual parts alone, but from all the bodily organs. We thus reach the idea of a quantity of libido, to the mental representation of which we give the name of 'ego-libido', and whose production, increase or diminution, distribution and displacement should afford us possibilities for explaining the psychosexual phenomena observed.

This ego-libido is, however, only conveniently accessible to analytic study when it has been put to the use of cathecting sexual objects, that is, when it has become object-libido. We can then perceive it concentrating upon objects, becoming fixed upon them or abandoning them, moving from one object to another and, from these situations, directing the subject's sexual activity, which leads to the satisfaction, that is, to the partial and temporary extinction, of the libido. The psycho-analysis of what are termed transference neuroses (hysteria and obsessional neurosis) affords us a clear insight at this point.

We can follow the object-libido through still further vicissitudes. When it is withdrawn from objects, it is held in suspense in peculiar conditions of tension and is finally drawn back into the ego, so that it becomes ego-libido once again. In contrast to object-libido, we also describe ego-libido as 'narcissistic' libido. From the vantage-point of psycho-analysis we can look across a frontier, which we may not pass, at the activities of narcissistic libido, and may form some idea of the relation between it and object-libido.¹ Narcissistic or ego-libido seems to be the great reservoir from which the object-cathexes are sent out and into which they are withdrawn once more; the narcissistic libidinal cathexis of the ego is the original state of things, realized in earliest childhood, and is merely covered by the later extrusions of libido, but in essentials persists behind them.

It should be the task of a libido theory of neurotic and psychotic disorders to express all the observed phenomena and inferred processes in terms of the economics of the libido. It is easy to guess that the vicissitudes of the ego-libido will have the major part to play in this connection, especially when it is a question of explaining the deeper psychotic disturbances. We are then faced by the difficulty that our method of research, psycho-analysis, for the moment affords us assured information only on the transformations that take place in the object-libido,² but is unable to make any immediate distinction between the ego-libido and the other forms of energy operating in the ego.³

For the present, therefore, no further development of the libido theory is possible, except upon speculative lines. It would, however, be sacrificing all that we have gained hitherto from psycho-analytic observation, if we were to follow the example of C. G. Jung and water down the meaning of the concept of libido itself by equating it with psychical instinctual force in general. The distinguishing of the sexual instinctual impulses from the rest and the consequent restriction of the concept of libido to the former receives strong support from the assumption which I have already discussed that there is a special chemistry of the sexual function.

¹ [Footnote added 1924:] Since neuroses other than the transference neuroses have become to a greater extent accessible to psycho-analysis, this limitation has lost its earlier validity.

² [Footnote added 1924:] See the previous footnote.

³ [Footnote added 1915:] Cf. my paper on narcissism (1914c). [Added 1920:] The term 'narcissism' was not introduced, as I erroneously stated in that paper, by Näcke, but by Havelock Ellis.

THE DIFFERENTIATION BETWEEN MEN AND WOMEN

As we all know, it is not until puberty that the sharp distinction is established between the masculine and feminine characters. From that time on, this contrast has a more decisive influence than any other upon the shaping of human life. It is true that the masculine and feminine dispositions are already easily recognizable in childhood. The development of the inhibitions of sexuality (shame, disgust, pity, etc.) takes place in little girls earlier and in the face of less resistance than in boys; the tendency to sexual repression seems in general to be greater; and, where the component instincts of sexuality appear, they prefer the passive form. The auto-erotic activity of the erotogenic zones is, however, the same in both sexes, and owing to this uniformity there is no possibility of a distinction between the two sexes such as arises after puberty. So far as the auto-erotic and masturbatory manifestations of sexuality are concerned, we might lay it down that the sexuality of little girls is of a wholly masculine character. Indeed, if we were able to give a more definite connotation to the concepts of 'masculine' and 'feminine', it would even be possible to maintain that libido is invariably and necessarily of a masculine nature, whether it occurs in men or in women and irrespective of whether its object is a man or a woman.¹

Since I have become acquainted with the notion of bisexuality I have regarded it as the decisive factor, and without taking bisexuality into account I think it would scarcely be possible to arrive at an understanding of the sexual manifestations that are actually to be observed in men and women.

¹ [*Footnote added 1915:*] It is essential to understand clearly that the concepts of 'masculine' and 'feminine', whose meaning seems so unambiguous to ordinary people, are among the most confused that occur in science. It is possible to distinguish at least three uses. 'Masculine' and 'feminine' are used sometimes in the sense of activity and passivity, sometimes in a biological, and sometimes, again, in a sociological sense. The first of these three meanings is the essential one and the most serviceable in psycho-analysis. When, for instance, libido was described in the text above as being 'masculine', the word was being used in this sense, for an instinct is always active even when it has a passive aim in view. The second, or biological, meaning of 'masculine' and 'feminine' is the one whose applicability can be determined most easily. Here 'masculine' and 'feminine' are characterized by the presence of spermatozoa or ova respectively and by the functions proceeding from them. Activity and its concomitant phenomena (more powerful muscular development, aggressiveness, greater intensity of libido) are as a rule linked with biological masculinity; but they are not necessarily so, for there are animal species in which these qualities are on the contrary assigned to the female. The third, or sociological, meaning receives its connotation from the observation of actually existing masculine and feminine individuals. Such observation shows that in human beings pure masculinity or femininity is not to be found either in a psychological or a biological sense. Every individual on the contrary displays a mixture of the character-traits belonging to his own and to the opposite sex; and he shows a combination of activity and passivity whether or not these last character-traits tally with his biological ones.

LEADING ZONES IN MEN AND WOMEN Apart from this I have only the following to add. The leading erotogenic zone in female children is located at the clitoris, and is thus homologous to the masculine genital zone of the glans penis. All my experience concerning masturbation in little girls has related to the clitoris and not to the regions of the external genitalia that are important in later sexual functioning. I am even doubtful whether a female child can be led by the influence of seduction to anything other than clitoridal masturbation. If such a thing occurs, it is quite exceptional. The spontaneous discharges of sexual excitement which occur so often precisely in little girls are expressed in spasms of the clitoris. Frequent erections of that organ make it possible for girls to form a correct judgement, even without any instruction, of the sexual manifestations of the other sex: they merely transfer on to boys the sensations derived from their own sexual processes.

If we are to understand how a little girl turns into a woman, we must follow the further vicissitudes of this excitability of the clitoris. Puberty, which brings about so great an accession of libido in boys, is marked in girls by a fresh wave of *repression*, in which it is precisely clitoridal sexuality that is affected. What is thus overtaken by repression is a piece of masculine sexuality. The intensification of the brake upon sexuality brought about by pubertal repression in women serves as a stimulus to the libido in men and causes an increase of its activity. Along with this heightening of libido there is also an increase of sexual overvaluation which only emerges in full force in relation to a woman who holds herself back and who denies her sexuality. When at last the sexual act is permitted and the clitoris itself becomes excited, it still retains a function: the task, namely, of transmitting the excitation to the adjacent female sexual parts, just as - to use a simile - pine shavings can be kindled in order to set a log of harder wood on fire. Before this transference can be effected, a certain interval of time must often elapse, during which the young woman is anaesthetic. This anaesthesia may become permanent if the clitoridal zone refuses to abandon its excitability, an event for which the way is prepared precisely by an extensive activity of that zone in childhood. Anaesthesia in women, as is well known, is often only apparent and local. They are anaesthetic at the vaginal orifice but are by no means incapable of excitement originating in the clitoris or even in other zones. Alongside these erotogenic determinants of anaesthesia must also be set the psychical determinants, which equally, arise from repression.

When erotogenic susceptibility to stimulation has been successfully transferred by a woman from the clitoris to the vaginal orifice, it implies that she has adopted a new leading zone for the purposes of her later sexual activity. A man, on the other hand, retains his leading zone unchanged from childhood. The fact that women change their leading erotogenic zone in this way, together with the wave of repression at puberty, which, as it were, puts aside their childish masculinity, are the chief determinants of the greater proneness of woman to neurosis and especially to hysteria. These determinants, therefore, are intimately related to the essence of femininity.

THE FINDING OF AN OBJECT

The processes at puberty thus establish the primacy of the genital zones; and, in a man, the penis, which has now become capable of erection, presses forward insistently towards the new sexual aim - penetration into a cavity in the body which excites his genital zone. Simultaneously on the psychical side the process of finding an object, for which preparations have been made from earliest childhood, is completed. At a time at which the first beginnings of sexual satisfaction are still linked with the taking of nourishment, the sexual instinct has a sexual object outside the infant's own body in the shape of his mother's breast. It is only later that the instinct loses that object, just at the time, perhaps, when the child is able to form a total idea of the person to whom the organ that is giving him satisfaction belongs. As a rule the sexual instinct then becomes auto-erotic, and not until the period of latency has been passed through is the original relation restored. There are thus good reasons why a child sucking at his mother's breast has become the prototype of every relation of love. The finding of an object is in fact a refinding of it.¹

¹ [*Footnote added 1915:*] Psycho-analysis informs us that there are two methods of finding an object. The first, described in the text, is the 'anaclitic' or 'attachment' one, based on attachment to early infantile prototypes. The second is the narcissistic one, which seeks for the subject's own ego and finds it again in other people. This latter method is of particularly great importance in cases where the outcome is a pathological one, but it is not relevant to the present context.

THE SEXUAL OBJECT DURING EARLY INFANCY But even after sexual activity has become detached from the taking of nourishment, an important part of this first and most significant of all sexual relations is left over, which helps to prepare for the choice of an object and thus to restore the happiness that has been lost. All through the period of latency children learn to feel for other people who help them in their helplessness and satisfy their needs a love which is on the model of, and a continuation of, their relation as sucklings to their nursing mother. There may perhaps be an inclination to dispute the possibility of identifying a child's affection and esteem for those who look after him with sexual love. I think, however, that a closer psychological examination may make it possible to establish this identity beyond any doubt. A child's intercourse with anyone responsible for his care affords him an unending source of sexual excitation and satisfaction from his erotogenic zones. This is especially so since the person in charge of him, who, after all, is as a rule his mother, herself regards him with feelings that are derived from her own sexual life: she strokes him, kisses him, rocks him and quite clearly treats him as a substitute for a complete sexual object.¹ A mother would probably be horrified if she were made aware that all her marks of affection were rousing her child's sexual instinct and preparing for its later intensity. She regards what she does as asexual, 'pure' love, since, after all, she carefully avoids applying more excitations to the child's genitals than are unavoidable in nursery care. As we know, however, the sexual instinct is not aroused only by direct excitation of the genital zone. What we call affection will unfailingly show its effects one day on the genital zones as well. Moreover, if the mother understood more of the high importance of the part played by instincts in mental life as a whole - in all its ethical and psychical achievements - she would spare herself any self-reproaches even after her enlightenment. She is only fulfilling her task in teaching the child to love. After all, he is meant to grow up into a strong and capable person with vigorous sexual needs and to accomplish during his life all the things that human beings are urged to do by their instincts. It is true that an excess of parental affection does harm by causing precocious sexual maturity and also because, by spoiling the child, it makes him incapable in later life of temporarily doing without love or of being content with a smaller amount of it. One of the clearest indications that a child will later become neurotic is to be seen in an insatiable demand for his parents' affection. And on the other hand neuropathic parents, who are inclined as a rule to display excessive affection, are precisely those who are most likely by their caresses to arouse the child's disposition to neurotic illness. Incidentally, this example shows that there are ways more direct than inheritance by which neurotic parents can hand their disorder on to their children.

¹ Anyone who considers this 'sacrilegious' may be recommended to read Havelock Ellis's views on the relation between mother and child, which agree almost completely with mine.

INFANTILE ANXIETY Children themselves behave from an early age as though their dependence on the people looking after them were in the nature of sexual love. Anxiety in children is originally nothing other than an expression of the fact that they are feeling the loss of the person they love. It is for this reason that they are frightened of every stranger. They are afraid in the dark because in the dark they cannot see the person they love; and their fear is soothed if they can take hold of that person's hand in the dark. To attribute to bogeys and blood-curdling stories told by nurses the responsibility for making children timid is to over-estimate their efficacy. The truth is merely that children who are inclined to be timid are affected by stories which would make no impression what ever upon others, and it is only children with a sexual instinct that is excessive or has developed prematurely or has become vociferous owing to too much petting who are inclined to be timid. In this respect a child, by turning his libido into anxiety when he cannot satisfy it, behaves like an adult. On the other hand an adult who has become neurotic owing to his libido being unsatisfied behaves in his anxiety like a child: he begins to be frightened when he is alone, that is to say when he is away from someone of whose love he had felt secure, and he seeks to assuage this fear by the most childish measures.¹

¹ For this explanation of the origin of infantile anxiety I have to thank a three-year-old boy whom I once heard calling out of a dark room: 'Auntie, speak to me! I'm frightened because it's so dark.' His aunt answered him: 'What good would that do? You can't see me.' 'That doesn't matter,' replied the child, 'if anyone speaks, it gets light.' Thus what he was afraid of was not the dark, but the absence of someone he loved; and he could feel sure of being soothed as soon as he had evidence of that person's presence. [Added 1920:] One of the most important results of psycho-analytic research is this discovery that neurotic anxiety arises out of libido, that it is the product of a transformation of it, and that it is thus related to it in the same kind of way as vinegar is to wine. A further discussion of this problem will be found in my *Introductory Lectures* (1916-17), Lecture XXV, though even there it must be confessed, the question is not finally cleared up.

THE BARRIER AGAINST INCEST We see, therefore, that the parents' affection for their child may awaken his sexual instinct prematurely (i.e. before the somatic conditions of puberty are present) to such a degree that the mental excitation breaks through in an unmistakable fashion to the genital system. If, on the other hand, they are fortunate enough to avoid this, then their affection can perform its task of directing the child in his choice of a sexual object when he reaches maturity. No doubt the simplest course for the child would be to choose as his sexual objects the same persons whom, since his childhood, he has loved with what may be described as damped-down libido.¹ But, by the postponing of sexual maturation, time has been gained in which the child can erect, among other restraints on sexuality, the barrier against incest, and can thus take up into himself the moral precepts which expressly exclude from his object-choice, as being blood relations, the persons whom he has loved in his childhood. Respect for this barrier is essentially a cultural demand made by society. Society must defend itself against the danger that the interests which it needs for the establishment of higher social units may be swallowed up by the family; and for this reason, in the case of every individual, but in particular of adolescent boys, it seeks by all possible means to loosen their connection with their family - a connection which, in their childhood, is the only important one.²

¹ [Footnote added 1915:] Cf. what has been said on [p. 1518](#) about children's object-choice and the 'affectionate current'.

² [Footnote added 1915:] The barrier against incest is probably among the historical acquisitions of mankind, and, like other moral taboos, has no doubt already become established in many persons by organic inheritance. (Cf. my *Totem and Taboo*, 1912-13.) Psycho-analytic investigation shows, however, how intensely the individual struggles with the temptation to incest during his period of growth and how frequently the barrier is transgressed in phantasies and even in reality.

It is in the world of ideas, however, that the choice of an object is accomplished at first; and the sexual life of maturing youth is almost entirely restricted to indulging in phantasies, that is, in ideas that are not destined to be carried into effect.¹ In these phantasies the infantile tendencies invariably emerge once more, but this time with intensified pressure from somatic sources. Among these tendencies the first place is taken with uniform frequency by the child's sexual impulses towards his parents, which are as a rule already differentiated owing to the attraction of the opposite sex - the son being drawn towards his mother and the daughter towards her father.² At the same time as these plainly incestuous phantasies are overcome and repudiated, one of the most significant, but also one of the most painful, psychical achievements of the pubertal period is completed: detachment from parental authority, a process that alone makes possible the opposition, which is so important for the progress of civilization, between the new generation and the old. At every stage in the course of development through which all human beings ought by rights to pass, a certain number are held back; so there are some who have never got over their parents' authority and have withdrawn their affection from them either very incompletely or not at all. They are mostly girls, who, to the delight of their parents, have persisted in all their childish love far beyond puberty. It is most instructive to find that it is precisely these girls who in their later marriage lack the capacity to give their husbands what is due to them; they make cold wives and remain sexually anaesthetic. We learn from this that sexual love and what appears to be non-sexual love for parents are fed from the same sources; the latter, that is to say, merely corresponds to an infantile fixation of the libido.

The closer one comes to the deeper disturbances of psychosexual development, the more unmistakably the importance of incestuous object-choice emerges. In psychoneurotics a large portion or the whole of their psychosexual activity in finding an object remains in the unconscious as a result of their repudiation of sexuality. Girls with an exaggerated need for affection and an equally exaggerated horror of the real demands made by sexual life have an irresistible temptation on the one hand to realize the ideal of asexual love in their lives and on the other hand to conceal their libido behind an affection which they can express without self-reproaches, by holding fast throughout their lives to their infantile fondness, revived at puberty, for their parents or brothers and sisters. Psycho-analysis has no difficulty in showing persons of this kind that they are *in love*, in the everyday sense of the word, with these blood-relations of theirs; for, with the help of their symptoms and other manifestations of their illness, it traces their unconscious thoughts and translates them into conscious ones. In cases in which someone who has previously been healthy falls ill after an unhappy experience in love it is also possible to show with certainty that the mechanism of his illness consists in a turning-back of his libido on to those whom he preferred in his infancy.

¹ [Footnote added 1920:] The phantasies of the pubertal period have as their starting-point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'Family Romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909).

It has justly been said that the Oedipus complex is the nuclear complex of the neuroses, and constitutes the essential part of their content. It represents the peak of infantile sexuality, which, through its after-effects, exercises a decisive influence on the sexuality of adults. Every new arrival on this planet is faced by the task of mastering the Oedipus complex; anyone who fails to do so falls a victim to neurosis. With the progress of psycho-analytic studies the importance of the Oedipus complex has become more and more clearly evident; its recognition has become the shibboleth that distinguishes the adherents of psycho-analysis from its opponents.

[Added 1924:] In another work (1924), Rank has traced attachment to the mother back to the prehistoric intra-uterine period and has thus indicated the biological foundation of the Oedipus complex. He differs from what has been said above, by deriving the barrier against incest from the traumatic effect of anxiety at birth.

² Cf. my remarks in *The Interpretation of Dreams* (1900a), on the inevitability of Fate in the fable of Oedipus.

AFTER-EFFECTS OF INFANTILE OBJECT-CHOICE Even a person who has been fortunate enough to avoid an incestuous fixation of his libido does not entirely escape its influence. It often happens that a young man falls in love seriously for the first time with a mature woman, or a girl with an elderly man in a position of authority; this is clearly an echo of the phase of development that we have been discussing, since these figures are able to re-animate pictures of their mother or father.¹ There can be no doubt that every object-choice whatever is based, though less closely, on these prototypes. A man, especially, looks for someone who can represent his picture of his mother, as it has dominated his mind from his earliest childhood; and accordingly, if his mother is still alive, she may well resent this new version of herself and meet her with hostility. In view of the importance of a child's relations to his parents in determining his later choice of a sexual object, it can easily be understood that any disturbance of those relations will produce the gravest effects upon his adult sexual life. Jealousy in a lover is never without an infantile root or at least an infantile reinforcement. If there are quarrels between the parents or if their marriage is unhappy, the ground will be prepared in their children for the severest predisposition to a disturbance of sexual development or to a neurotic illness.

A child's affection for his parents is no doubt the most important infantile trace which, after being revived at puberty, points the way to his choice of an object; but it is not the only one. Other starting-points with the same early origin enable a man to develop more than one sexual line, based no less upon his childhood, and to lay down very various conditions for his object-choice.²

¹ [Footnote added 1920:] Cf. my paper 'A Special Type of Choice of Object made by Men' (1910*h*).

² [Footnote added 1915:] The innumerable peculiarities of the erotic life of human beings as well as the compulsive character of the process of falling in love itself are quite unintelligible except by reference back to childhood and as being residual effects of childhood.

PREVENTION OF INVERSION One of the tasks implicit in object-choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.¹ This factor is not in itself, however, sufficient to exclude inversion; there are to doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women; on the other hand their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object-choice decisively in what is regarded as the normal direction. The education of boys by male persons (by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion.

¹ [Footnote added 1924:] This is the place at which to draw attention to Ferenczi's *Versuch einer Genitaltheorie* (1924), a work which, though somewhat fanciful, is nevertheless of the greatest interest, and in which the sexual life of the higher animals is traced back to their biological evolution.

SUMMARY

The time has arrived for me to attempt to summarize what I have said. We started out from the aberrations of the sexual instinct in respect of its object and of its aim and we were faced by the question of whether these arise from an innate disposition or are acquired as a result of experiences in life. We arrived at an answer to this question from an understanding, derived from psycho-analytic investigation, of the workings of the sexual instinct in psychoneurotics, a numerous class of people and one not far removed from the healthy. We found that in them tendencies to every kind of perversion can be shown to exist as unconscious forces and betray their presence as factors leading to the formation of symptoms. It was thus possible to say that neurosis is, as it were, the negative of perversion. In view of what was now seen to be the wide dissemination of tendencies to perversion we were driven to the conclusion that a disposition to perversions is an original and universal disposition of the human sexual instinct and that normal sexual behaviour is developed out of it as a result of organic changes and psychical inhibitions occurring in the course of maturation; we hoped to be able to show the presence of this original disposition in childhood. Among the forces restricting the direction taken by the sexual instinct we laid emphasis upon shame, disgust, pity and the structures of morality and authority erected by society. We were thus led to regard any established aberration from normal sexuality as an instance of developmental inhibition and infantilism. Though it was necessary to place in the foreground the importance of the variations in the original disposition, a co-operative and not an opposing relation was to be assumed as existing between them and the influences of actual life. It appeared, on the other hand, that since the original disposition is necessarily a complex one, the sexual instinct itself must be something put together from various factors, and that in the perversions it falls apart, as it were, into its components. The perversions were thus seen to be on the one hand inhibitions, and on the other hand dissociations, of normal development. Both these aspects were brought together in the supposition that the sexual instinct of adults arises from a combination of a number of impulses of childhood into a unity, an impulsion with a single aim.

After having explained the preponderance of perverse tendencies in psychoneurotics by recognizing it as a collateral filling of subsidiary channels when the main current of the instinctual stream has been blocked by 'repression',¹ we proceeded to a consideration of sexual life in childhood. We found it a regrettable thing that the existence of the sexual instinct in childhood has been denied and that the sexual manifestations not infrequently to be observed in children have been described as irregularities. It seemed to us on the contrary that children bring germs of sexual activity with them into the world, that they already enjoy sexual satisfaction when they begin to take nourishment and that they persistently seek to repeat the experience in the familiar activity of 'thumb-sucking'. The sexual activity of children, however, does not, it appeared, develop *pari passu* with their other functions, but, after a short period of efflorescence from the ages of two to five, enters upon the so-called period of latency. During that period the production of sexual excitation is not by any means stopped but continues and produces a store of energy which is employed to a great extent for purposes other than sexual - namely, on the one hand in contributing the sexual components to social feelings and on the other hand (through repression and reaction-forming) in building up the subsequently developed barriers against sexuality. On this view, the forces destined to retain the sexual instinct upon certain lines are built up in childhood chiefly at the cost of perverse sexual impulses and with the assistance of education. A certain portion of the infantile sexual impulses would seem to evade these uses and succeed in expressing itself as sexual activity. We next found that sexual excitation in children springs from a multiplicity of forces. Satisfaction arises first and foremost from the appropriate sensory excitation of what we have described as erotogenic zones. It seems probable that any part of the skin and any sense-organ - probably, indeed, *any* organ - can function as an erotogenic zone, though there are some particularly marked erotogenic zones whose excitation would seem to be secured from the very first by certain organic contrivances. It further appears that sexual excitation arises as a by-product, as it were, of a large number of processes that occur in the organism, as soon as they reach a certain degree of intensity, and most especially of any relatively powerful emotion, even though it is of a distressing nature. The excitations from all these sources are not yet combined; but each follows its own separate aim, which is merely the attainment of a certain sort of pleasure. In childhood, therefore, the sexual instinct is not unified and is at first without an object, that is, auto-erotic.

¹ [Footnote added 1915:] This does not apply only to the 'negative' tendencies to perversion which appear in neuroses but equally to the 'positive,' properly so-called, perversions. Thus these latter are to be derived not merely from a fixation of infantile tendencies but also from a regression to those tendencies as a result of other channels of the sexual current being blocked. It is for this reason that the positive perversions also are accessible to psycho-analytic therapy.

The erotogenic zone of the genitals begins to make itself noticeable, it seems, even during the years of childhood. This may happen in two ways. Either, like any other erotogenic zone, it yields satisfaction in response to appropriate sensory stimulation; or, in a manner which is not quite understandable, when satisfaction is derived from other sources, a sexual excitation is simultaneously produced which has a special relation to the genital zone. We were reluctantly obliged to admit that we could not satisfactorily explain the relation between sexual satisfaction and sexual excitation, or that between the activity of the genital zone and the activity of the other sources of sexuality.

We found from the study of neurotic disorders that beginnings of an organization of the sexual instinctual components can be detected in the sexual life of children from its very beginning. During a first, very early phase, oral erotism occupies most of the picture. A second of these pregenital organizations is characterized by the predominance of sadism and anal erotism. It is not until a third phase has been reached that the genital zones proper contribute their share in determining sexual life, and in children this last phase is developed only so far as to a primacy of the phallus.

We were then obliged to recognize, as one of our most surprising findings, that this early efflorescence of infantile sexual life (between the ages of two and five) already gives rise to the choice of an object, with all the wealth of mental activities which such a process involves. Thus, in spite of the lack of synthesis between the different instinctual components and the uncertainty of the sexual aim, the phase of development corresponding to that period must be regarded as an important precursor of the subsequent final sexual organization.

The fact that the onset of sexual development in human beings occurs in two phases, i.e. that the development is interrupted by the period of latency, seemed to call for particular notice. This appears to be one of the necessary conditions of the aptitude of men for developing a higher civilization, but also of their tendency to neurosis. So far as we know, nothing analogous is to be found in man's animal relatives. It would seem that the origin of this peculiarity of man must be looked for in the prehistory of the human species.

It was not possible to say what amount of sexual activity can occur in childhood without being described as abnormal or detrimental to further development. The nature of these sexual manifestations was found to be predominantly masturbatory. Experience further showed that the external influences of seduction are capable of provoking interruptions of the latency period or even its cessation, and that in this connection the sexual instinct of children proves in fact to be polymorphously perverse; it seems, moreover, that any such premature sexual activity diminishes a child's educability.

In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which, enormously pleasurable, brings the sexual excitation to an end. In this connection we had to take into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object-choice, we found that it is given its direction by the childhood hints (revived at puberty) of the child's sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally it must be added that during the transition period of puberty the processes of somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

FACTORS INTERFERING WITH DEVELOPMENT Every step on this long path of development can become a point of fixation, every juncture in this involved combination can be an occasion for a dissociation of the sexual instinct, as we have already shown from numerous instances. It remains for us to enumerate the various factors, internal and external, that interfere with development, and to indicate the place in the mechanism on which the disturbance arising from each of them impinges. The factors that we shall enumerate can evidently not be of equal importance, and we must be prepared for difficulties in assigning an appropriate value to each.

CONSTITUTION AND HEREDITY First and foremost we must name the innate variety of sexual constitutions, upon which it is probable that the principal weight falls, but which can clearly only be inferred from their later manifestations and even then not always with great certainty. We picture this variety as a preponderance of one or another of the many sources of sexual excitation, and it is our view that a difference in disposition of this kind is always bound to find expression in the final result, even though that result may not overstep the limits of what is normal. No doubt it is conceivable that there may also be variations in the original disposition of a kind which must necessarily, and without the concurrence of any other factors, lead to the development of an abnormal sexual life. These might be described as 'degenerative' and be regarded as an expression of inherited degeneracy. In this connection I have a remarkable fact to record. In more than half of the severe cases of hysteria, obsessional neurosis, etc., which I have treated psychotherapeutically, I have been able to prove with certainty that the patient's father suffered from syphilis before marriage, whether there was evidence of tabes or general paralysis, or whether the anamnesis indicated in some other way the presence of syphilitic disease. I should like to make it perfectly plain that the children who later became neurotic bore no physical signs of hereditary syphilis, so that it was their abnormal sexual constitution that was to be regarded as the last echo of their syphilitic heritage. Though I am far from wishing to assert that descent from syphilitic parents is an invariable or indispensable aetiological condition of a neuropathic constitution, I am nevertheless of opinion that the coincidence which I have observed is neither accidental nor unimportant.

The hereditary conditions in the case of positive pervers are less well known, for they know how to avoid investigation. Yet there are good reasons to suppose that what is true of the neuroses applies also to the perversions. For it is no rare thing to find perversions and psychoneuroses occurring in the same family, and distributed between the two sexes in such a way that the male members of the family, or one of them, are positive pervers, while the females, true to the tendency of their sex to repression, are negative pervers, that is, hysterics. This is good evidence of the essential connections which we have shown to exist between the two disorders.

FURTHER MODIFICATION On the other hand, it is not possible to adopt the view that the form to be taken by sexual life is unambiguously decided, once and for all, with the inception of the different components of the sexual constitution. On the contrary, the determining process continues, and further possibilities arise according to the vicissitudes of the tributary streams of sexuality springing from their separate sources. This further modification is clearly what brings the decisive outcome, and constitutions which might be described as the same can lead to three different final results:-

If the relation between all the different dispositions - a relation which we will assume to be abnormal - persists and grows stronger at maturity, the result can only be a perverse sexual life. The analysis of abnormal constitutional dispositions of this kind has not yet been properly taken in hand. But we already know cases which can easily be explained on such a basis as this. Writers on the subject, for instance, have asserted that the necessary precondition of a whole number of perverse fixations lies in an innate weakness of the sexual instinct. In this form the view seems to me untenable. It makes sense, however, if what is meant is a constitutional weakness of one particular factor in the sexual instinct, namely the genital zone - a zone which takes over the function of combining the separate sexual activities for the purposes of reproduction. For if the genital zone is weak, this combination, which is required to take place at puberty, is bound to fail, and the strongest of the other components of sexuality will continue its activity as a perversion.¹

¹ [*Footnote added 1915:*] In such circumstances one often finds that at puberty a normal sexual current begins to operate at first, but that, as a result of its internal weakness, it breaks down in face of the first external obstacles and is then replaced by regression to the perverse fixation.

REPRESSION A different result is brought about if in the course of development some of the components which are of excessive strength in the disposition are submitted to the process of repression (which, it must be insisted, is not equivalent to their being abolished). If this happens, the excitations concerned continue to be generated as before; but they are prevented by psychical obstruction from attaining their aim and are diverted into numerous other channels till they find their way to expression as symptoms. The outcome may be an approximately normal sexual life - though usually a restricted one - but there is in addition psychoneurotic illness. These particular cases have become familiar to us from the psycho-analytic investigation of neurotics. Their sexual life begins like that of perverts, and a considerable part of their childhood is occupied with perverse sexual activity which occasionally extends far into maturity. A reversal due to repression then occurs, owing to internal causes (usually before puberty, but now and then even long afterwards), and from that time onwards neurosis takes the place of perversion, without the old impulses being extinguished. We are reminded of the proverb 'Junge Hure, alte Betschwester',¹ only that here youth has lasted all too short a time. The fact that perversion can be replaced by neurosis in the life of the same person, like the fact which we have already mentioned that perversion and neurosis can be distributed among different members of the same family, tallies with the view that neurosis is the negative of perversion.

¹ ['A young whore makes an old nun.']

SUBLIMATION The third alternative result of an abnormal constitutional disposition is made possible by the process of sublimation. This enables excessively strong excitations arising from particular sources of sexuality to find an outlet and use in other fields, so that a not inconsiderable increase in psychical efficiency results from a disposition which is itself is perilous. Here we have one of the origins of artistic activity; and, according to the completeness or incompleteness of the sublimation, a characterological analysis of a highly gifted individual, and in particular of one with an artistic disposition, may reveal a mixture, in every proportion, of efficiency, perversion and neurosis. A sub-species of sublimation is to be found in suppression by reaction-formation, which, as we have seen, begins during a child's period of latency and continues in favourable cases throughout his whole life. What we describe as a person's 'character' is built up to a considerable extent from the material of sexual excitations and is composed of instincts that have been fixed since childhood, of constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse impulses which have been recognized as being unutilizable.¹ The multifariously perverse sexual disposition of childhood can accordingly be regarded as the source of a number of our virtues, in so far as through reaction-formation it stimulates their development.²

¹ [Footnote added 1920:] In the case of some character-traits it has even been possible to trace a connection with particular erotogenic components. Thus, obstinacy, thrift and orderliness arise from an exploitation of anal erotism, while ambition is determined by a strong urethral-erotic disposition.

² Emile Zola, a keen observer of human nature, describes in *La joie de vivre* how a girl, cheerfully and selflessly and without thought of reward, sacrificed to those she loved everything that she possessed or could lay claim to - her money and her hopes. This girl's childhood was dominated by an insatiable thirst for affection, which was transformed into cruelty on an occasion when she found herself slighted in favour of another girl.

ACCIDENTAL EXPERIENCES No other influences on the course of sexual development can compare in importance with releases of sexuality, waves of repression and sublimations - the two latter being processes of which the inner causes are quite unknown to us. It might be possible to include repressions and sublimations as a part of the constitutional disposition, by regarding them as manifestations of it in life; and anyone who does so is justified in asserting that the final shape taken by sexual life is principally the outcome of the innate constitution. No one with perception will, however, dispute that an interplay of factors such as this also leaves room for the modifying effects of accidental events experienced in childhood and later. It is not easy to estimate the relative efficacy of the constitutional and accidental factors. In theory one is always inclined to overestimate the former; therapeutic practice emphasizes the importance of the latter. It should, however, of no account be forgotten that the relation between the two is a co-operative and not a mutually exclusive one. The constitutional factor must await experiences before it can make itself felt; the accidental factor must have a constitutional basis in order to come into operation. To cover the majority of cases we can picture what has been described as a 'complemental series', in which the diminishing intensity of one factor is balanced by the increasing intensity of the other; there is, however, no reason to deny the existence of extreme cases at the two ends of the series.

We shall be in even closer harmony with psycho-analytic research if we give a place of preference among the accidental factors to the experiences of early childhood. The single aetiological series then falls into two, which may be called the dispositional and the definitive. In the first the constitution and the accidental experiences of childhood interact in the same manner as do the disposition and later traumatic experiences in the second. All the factors that impair sexual development show their effects by bringing about a regression, a return to an earlier phase of development.

Let us now resume our task of enumerating the factors which we have found to exercise an influence on sexual development, whether they are themselves operative forces or merely manifestations of such forces.

PRECOCITY One such factor is spontaneous sexual precocity, whose presence at least can be demonstrated with certainty in the aetiology of the neuroses though, like other factors, it is not in itself a sufficient cause. It is manifested in the interruption, abbreviation or bringing to an end of the infantile period of latency; and it is a cause of disturbances by occasioning sexual manifestations which, owing on the one hand to the sexual inhibitions being incomplete and on the other hand to the genital system being undeveloped, are bound to be in the nature of perversions. These tendencies to perversion may thereafter either persist as such or, after repressions have set in, become the motive forces of neurotic symptoms. In any case sexual precocity makes more difficult the later control of the sexual instinct by the higher mental agencies which is so desirable, and it increases the impulsive quality which, quite apart from this, characterizes the psychical representations of the instinct. Sexual precocity often runs parallel with premature intellectual development and, linked in this way, is to be found in the childhood history of persons of the greatest eminence and capacity; under such conditions its effects do not seem to be so pathogenic as when it appears in isolation.

TEMPORAL FACTORS Other factors which, along with precocity, may be classed as temporal also deserve attention. The order in which the various instinctual impulses come into activity seems to be phylogenetically determined; so, too, does the length of time during which they are able to manifest themselves before they succumb to the effects of some freshly emerging instinctual impulse or to some typical repression. Variations, however, seem to occur both in temporal sequence and in duration, and these variations must exercise a determining influence upon the final result. It cannot be a matter of indifference whether a given current makes its appearance earlier or later than a current flowing in the opposite direction, for the effect of a repression cannot be undone. Divergences in the temporal sequence in which the components come together invariably produce a difference in the outcome. On the other hand, instinctual impulses which emerge with special intensity often run a surprisingly short course - as, for instance, the heterosexual attachment of persons who later become manifest homosexuals. There is no justification for the fear that trends which set in with the greatest violence in childhood will permanently dominate the adult character; it is just as likely that they will disappear and make way for an opposite tendency. ('Gestrengte Herren regieren nicht Lange.')

We are not in a position to give so much as hint as to the causes of these temporal disturbances of the process of development. A prospect opens before us at this point upon a whole phalanx of biological and perhaps, too, of historical problems of which we have not even come within striking distance.

¹ ['Harsh rulers have short reigns.']

PERTINACITY OF EARLY IMPRESSIONS The importance of all early sexual manifestations is increased by a psychical factor of unknown origin, which at the moment, it must be admitted, can only be brought forward as a provisional psychological concept. I have in mind the fact that, in order to account for the situation, it is necessary to assume that these early impressions of sexual life are characterized by an increased pertinacity or susceptibility to fixation in persons who are later to become neurotics or perverts. For the same premature sexual manifestations, when they occur in other persons, fail to make so deep an impression; they do not tend in a compulsive manner towards repetition nor do they lay down the path to be taken by the sexual instinct for a whole lifetime. Part of the explanation of this pertinacity of early impressions may perhaps lie in another psychical factor which we must not overlook in the causation of the neuroses, namely the preponderance attaching in mental life to memory-traces in comparison with recent impressions. This factor is clearly dependent on intellectual education and increases in proportion to the degree of individual culture. The savage has been described in contrast as 'das unglückselige Kind des Augenblickes' ['The hapless child of the moment.'].¹ In consequence of the inverse relation holding between civilization and the free development of sexuality, of which the consequences can be followed far into the structure of our existences, the course taken by the sexual life of a child is just as unimportant for later life where the cultural or social level is relatively low as it is important where that level is relatively high.

FIXATION The ground prepared by the psychical factors which have just been enumerated affords a favourable basis for such stimulations of infantile sexuality as are experienced accidentally. The latter (first and foremost, seduction by other children or by adults) provide the material which, with the help of the former, can become fixated as a permanent disorder. A good proportion of the deviations from normal sexual life which are later observed both in neurotics and in perverts are thus established from the very first by the impressions of childhood - a period which is regarded as being devoid of sexuality. The causation is shared between a compliant constitution, precocity, the characteristic of increased pertinacity of early impressions and the chance stimulation of the sexual instinct by extraneous influences.

The unsatisfactory conclusion, however, that emerges from these investigations of the disturbances of sexual life is that we know far too little of the biological processes constituting the essence of sexuality to be able to construct from our fragmentary information a theory adequate to the understanding alike of normal and of pathological conditions.

¹ Increase in pertinacity may also possibly be the effect of an especially intense somatic manifestation of sexuality in early years.

FREUD'S PSYCHO-ANALYTIC PROCEDURE (1904)

Intentionally left blank

FREUD'S PSYCHO-ANALYTIC PROCEDURE

The particular psychotherapeutic procedure which Freud practises and describes as 'psycho-analysis' is an outgrowth of what was known as the 'cathartic' method and was discussed by him in collaboration with Josef Breuer in their *Studies on Hysteria* (1895). This cathartic therapy was a discovery of Breuer's, and was first used by him some ten years earlier in the successful treatment of a hysterical woman patient, in the course of which he obtained an insight into the pathogenesis of her symptoms. As the result of a personal suggestion from Breuer, Freud revived this procedure and tested it on a considerable number of patients.

The cathartic method of treatment presupposed that the patient could be hypnotized, and was based on the widening of consciousness that occurs under hypnosis. Its aim was the removal of the pathological symptoms, and it achieved this by inducing the patient to return to the psychical state in which the symptom had appeared for the first time. When this was done, there emerged in the hypnotized patient's mind memories, thoughts and impulses which had previously dropped out of his consciousness; and, as soon as he had related these to the physician, to the accompaniment of intense expressions of emotion, the symptom was overcome and its return prevented. This experience, which could be regularly repeated, was taken by the authors in their joint paper to signify that the symptom takes the place of suppressed processes which have not reached consciousness, that is, that it represents a transformation ('conversion') of these processes. They explained the therapeutic effectiveness of their treatment as due to the discharge of what had previously been, as it were, 'strangled' affect attaching to the suppressed mental acts ('abreaction'). But in practice the simple schematic outline of the therapeutic operation was almost always complicated by the circumstance that it was not a *single* ('traumatic') impression, but in most cases a *series* of impressions - not easily scanned - which had participated in the creation of the symptom.

The main characteristic of the cathartic method, in contrast to all other methods used in psychotherapy, consists in the fact that its therapeutic efficacy does not lie in The expectation is rather that the symptoms will disappear automatically as soon as the operation, based on certain hypotheses concerning the psychical mechanism, succeeds in diverting the course of mental processes from their previous channel, which found an outlet in the formation of the symptom.

The changes which Freud introduced in Breuer's cathartic method of treatment were at first changes in technique; these, however, led to new findings and have finally necessitated a different though not contradictory conception of the therapeutic process.

The cathartic method had already renounced suggestion; Freud went a step further and gave up hypnosis as well. At the present time he treats his patients as follows. Without exerting my other kind of influence, he invites them to lie down in a comfortable attitude on a sofa, while he himself sits on a chair behind them outside their field of vision. He does not even ask them to close their eyes, and avoids touching them in any way, as well as any other procedure which might be reminiscent of hypnosis. The session thus proceeds like a conversation between two people equally awake, but one of whom is spared every muscular exertion and every distracting sensory impression which might divert his attention from his own mental activity.

Since, as we all know, it depends upon the choice of the patient whether he can be hypnotized or not, no matter what the skill of the physician may be, and since a large number of neurotic patients cannot be hypnotized by any means whatever, it followed that with the abandonment of hypnosis the applicability of the treatment was assured to an unlimited number of patients. On the other hand, the widening of consciousness, which had supplied the physician with precisely the psychical material of memories and images by the help of which the transformation of the symptoms and the liberation of the affects was accomplished, was now missing. Unless a substitute could be produced for this missing element, any therapeutic effect was out of the question.

Freud found such a substitute - and a completely satisfactory one - in the 'associations' of his patients; that is, in the involuntary thoughts (most frequently regarded as disturbing elements and therefore ordinarily pushed aside) which so often break across the continuity of a consecutive narrative.

In order to secure these ideas and associations he asks the patient to 'let himself go' in what he says, 'as you would do in a conversation in which you were rambling on quite disconnectedly and at random'. Before he asks them for a detailed account of their case history he insists that they must include in it whatever comes into their heads, even if they think it unimportant or irrelevant or nonsensical; he lays special stress on their not omitting any thought or idea from their story because to relate it would be embarrassing or distressing to them. In the course of collecting this material of otherwise neglected ideas Freud made the observations which became the determining factor of his entire theory. Gaps appear in the patient's memory even while he narrates his case: actual occurrences are forgotten, the chronological order is confused, or causal connections are broken, with unintelligible results. No neurotic case history is without amnesia of some kind or other. If the patient is urged to fill these gaps in his memory by an increased application of attention, it is noticed that all the ideas which occur to him are pushed back by every possible critical expedient, until at last he feels positive discomfort when the memory really returns. From this experience Freud concludes that the amnesias are the result of a process which he calls '*repression*' and the motive for which he finds in feelings of unpleasure. The psychical forces which have brought about this repression can also be detected, according to him, in the '*resistance*' which operates against the recovery of the lost memories.

The factor of resistance has become one of the corner-stones of his theory. The ideas which are normally pushed aside on every sort of excuse - such as those mentioned above - are regarded by him as derivatives of the repressed psychical phenomena (thoughts and impulses), distorted owing to the resistance against their reproduction. Ideas which are normally pushed aside on every sort of excuse - such as those mentioned above - are regarded by him as derivatives of the repressed psychical phenomena (thoughts and impulses), distorted owing to the resistance against their reproduction.

The greater the resistance, the greater is the distortion. The value of these unintentional thoughts for the purposes of therapeutic technique lies in this relation of theirs to the repressed psychical material. If one possesses a procedure which makes it possible to arrive at the repressed material from the associations, at the distorted material from the distortions, then what was formerly unconscious in mental life can be made accessible to consciousness even without hypnosis.

Freud has developed on this basis an art of interpretation which takes on the task of, as it were, extracting the pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue, bungled actions, and so on). The details of this technique of interpretation or translation have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called *The Interpretation of Dreams*, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.

From these remarks on the technique of the psycho-analytic method the conclusion might be drawn that its inventor has given himself needless trouble and has made a mistake in abandoning the less complicated hypnotic mode of procedure. However, in the first place, the technique of psycho-analysis is much easier in practice, when once one has learnt it, than any description of it would indicate; and, secondly, there is no other way which leads to the desired goal, so that the hard road is still the shortest one to travel. The objection to hypnosis is that it conceals the resistance and for that reason has obstructed the physician's insight into the play of psychical forces. Hypnosis does not do away with the resistance but only evades it and therefore yields only incomplete information and transitory therapeutic success.

The task which the psycho-analytic method seeks to perform may be formulated in different ways, which are, however, in their essence equivalent. It may, for instance, be stated thus: the task of the treatment is to remove the amnesias. When all gaps in memory have been filled in, all the enigmatic products of mental life elucidated, the continuance and even a renewal of the morbid condition are made impossible. Or the formula may be expressed in this fashion: all repressions must be undone. The mental condition is then the same as one in which all amnesias have been removed. Another formulation reaches further: the task consists in making the unconscious accessible to consciousness, which is done by overcoming the resistances. But it must be remembered that an ideal condition such as this is not present even in the normal, and further that it is only rarely possible to carry the treatment to a point approaching it. Just as health and sickness are not different from each other in essence but are only separated by a quantitative line of demarcation which can be determined in practice, so the aim of the treatment will never be anything else but the *practical* recovery of the patient, the restoration of his ability to lead an active life and of his capacity for enjoyment. In a treatment which is incomplete or in which success is not perfect, one may at any rate achieve a considerable improvement in the general mental condition, while the symptoms (though now of smaller importance to the patient) may continue to exist without stamping him as a sick man.

The therapeutic procedure remains the same, apart from insignificant modifications, for all the various clinical pictures that may be presented in hysteria, and all forms of obsessional neurosis. This does not imply, however, that it can have an unlimited application. The nature of the psycho-analytic method involves indications and contra-indications with respect to the person to be treated as well as with respect to the clinical picture. Chronic cases of psychoneuroses without any very violent or dangerous symptoms are the most favourable ones for psycho-analysis: thus in the first place every species of obsessional neurosis, obsessive thinking and acting, and cases of hysteria in which phobias and aboulias play the most important part; further, all somatic expressions of hysteria whenever they do not, as in anorexia, require the physician to attend promptly to the speedy removal of symptoms. In acute cases of hysteria it will be necessary to wait for a calmer stage; in all cases where nervous exhaustion dominates the clinical picture a treatment which in itself demands effort, brings only slow improvement and for a time cannot take the persistence of the symptoms into account, will have to be avoided.

Various qualifications are required of anyone who is to be beneficially affected by psycho-analysis. To begin with, he must be capable of a psychically normal condition; during periods of confusion or melancholic depression nothing can be accomplished even in cases of hysteria. Furthermore, a certain measure of natural intelligence and ethical development are to be required of him; if the physician has to deal with a worthless character, he soon loses the interest which makes it possible for him to enter profoundly into the patient's mental life. Deep-rooted malformations of character, traits of an actually degenerate constitution, show themselves during treatment as sources of a resistance that can scarcely be overcome. In this respect the constitution of the patient sets a general limit to the curative effect of psychotherapy. If the patient's age is in the neighbourhood of the fifties the conditions for psycho-analysis become unfavourable. The mass of psychical material is then no longer manageable; the time required for recovery is too long; and the ability to undo psychical processes begins to grow weaker.

In spite of all these limitations, the number of persons suitable for psycho-analytic treatment is extraordinarily large and the extension which has come to our therapeutic powers from this method is, according to Freud, very considerable. Freud requires long periods, six months to three years, for an effective treatment; yet he informs us that up to the present, owing to various circumstances which can easily be guessed, he has for the most part been in a position to try his treatment only on very severe cases: patients have come to him after many years of illness, completely incapacitated for life, and, after being disappointed by all kinds of treatments, have had recourse as a last resort to a method which is novel and has been greeted with many doubts. In cases of less severe illness the duration of the treatment might well be much shorter, and very great advantage in the direction of future prevention might be achieved.

ON PSYCHOTHERAPY
(1905)

Intentionally left blank

ON PSYCHOTHERAPY

Gentlemen, - Some eight years have passed since I had the opportunity, on the invitation of your much respected chairman, Professor von Reder, of speaking here on the subject of hysteria. Shortly before that occasion I had published, in 1895, in collaboration with Dr. Josef Breuer, the *Studies on Hysteria* in which, on the basis of the new knowledge which we owe to his researches, an attempt was made to introduce a new method of treating the neuroses. I am glad to be able to say that the efforts we made in our *Studies* have met with success; the ideas expressed in them concerning the effects produced by psychical traumas owing to retention of affect, as well as the conception of hysterical symptoms as the results of an excitation transposed from the sphere of the mental to the physical - ideas for which we coined the terms 'abreaction' and 'conversion' - are to-day generally known and understood. There is, at least in German speaking countries, no presentation of hysteria to-day that does not take them to some extent into account, and we have no colleagues who do not, for a short distance at least, follow the road pointed out by us. And yet, while they were still new, these theorems and this terminology must have sounded not a little strange.

I cannot say the same of the therapeutic procedure which was introduced to our colleagues at the same time as our theory; it is still struggling for recognition. There may be special reasons for this. At that time the technique of the method was as yet undeveloped; it was impossible for me to give medical readers of the book the directions necessary to enable them to carry through the treatment completely. But causes of a general nature have certainly also played a part. To many physicians, even to-day, psychotherapy seems to be a product of modern mysticism and, compared with our physico-chemical remedies which are applied on the basis of physiological knowledge, appears positively unscientific and unworthy of the attention of a serious investigator. Allow me, therefore, to defend the cause of psychotherapy before you, and to point out to you what may be described as unjust or mistaken in this condemnation of it.

In the first place, let me remind you that psychotherapy is in no way a modern method of treatment. On the contrary, it is the most ancient form of therapy in medicine. In Löwenfeld's instructive *Lehrbuch der gesamten Psychotherapie* many of the methods of primitive and ancient medical science are described. The majority of them must be classed under the head of psychotherapy; in order to effect a cure a condition of 'expectation coloured by faith' was induced in sick persons - a condition which answers a similar purpose for us to-day. Even since physicians have come upon other remedies, psychotherapeutic endeavours of one kind or another have never completely disappeared from medicine.

Secondly, let me draw your attention to the fact that we physicians cannot discard psychotherapy, if only because another person intimately concerned in the process of recovery - the patient - has no intention of discarding it. You will know of the increase in knowledge on this subject that we owe to the Nancy school, to Liébeault and Bernheim. A factor dependent on the psychical disposition of the patient contributes, without any intention on our part, to the effect of every therapeutic process initiated by a physician; most frequently it is favourable to recovery, but often it acts as an inhibition. We have learned to use the word 'suggestion' for this phenomenon, and Möbius has taught us that the unreliability which we deplore in so many of our therapeutic measures may be traced back to the disturbing influence of this very powerful factor. All physicians, therefore, yourselves included, are continually practising psychotherapy, even when you have no intention of doing so and are not aware of it; it is a disadvantage, however, to leave the mental factor in your treatment so completely in the patient's hands. Thus it is impossible to keep a check on it, to administer it in doses or to intensify it. Is it not then a justifiable endeavour on the part of a physician to seek to obtain command of this factor, to use it with a purpose, and to direct and strengthen it? This and nothing else is what scientific psychotherapy proposes.

And, in the third place, Gentlemen, I would remind you of the well-established fact that certain diseases, in particular the psychoneuroses, are far more readily accessible to mental influences than to any other form of medication. It is not a modern dictum but an old saying of physicians that these diseases are not cured by the drug but by the physician, that is, by the personality of the physician, inasmuch as through it he exerts a mental influence. I am well aware that you favour the view which Vischer, the professor of aesthetics, expressed so well in his parody of Faust:

Ich weiß, das Physikalische
Wirkt öfters aufs Moralische¹

But would it not be more to the point to say - and is it not more often the case - moral (that is, mental) means can influence a man's moral side?

There are many ways and means of practising psychotherapy. All that lead to recovery are good. Our usual word of comfort, which we dispense so liberally to our patients - 'You'll soon be all right again' -, corresponds to one of these psychotherapeutic methods; but now that we have deeper insight into the neuroses, we are no longer obliged to confine ourselves to the word of comfort. We have developed the technique of hypnotic suggestion, and psychotherapy by mental distraction, by exercise, and by eliciting suitable affects. I despise none of these methods and would use them all in appropriate circumstances. If I have actually come to confine myself to one form of treatment, to the method which Breuer called *cathartic*, but which I myself prefer to call 'analytic', it is because I have allowed myself to be influenced by purely subjective motives. Because of the part I have played in founding this therapy, I feel a personal obligation to devote myself to closer investigation of it and to the development of its technique. And I may say that the analytic method of psychotherapy is the one that penetrates most deeply and carries farthest, the one by means of which the most extensive transformations can be effected in patients. Putting aside for a moment the therapeutic point of view, I may also say of it that it is the most interesting method, the only one which informs us at all about the origin and inter-relation of morbid phenomena. Owing to the insight which we gain into mental illness by this method, it alone should be capable of leading us beyond its own limits and of pointing out the way to other forms of therapeutic influence.

¹ [I know that the physical
Often influences the moral.]

Permit me now to correct a few mistakes that have been made in regard to this cathartic or analytic method of psychotherapy, and to give a few explanations on the subject.

(a) I have observed that this method is very often confused with hypnotic treatment by suggestion; I have noticed this because it happens comparatively often that colleagues who do not ordinarily confide their cases to me send me patients refractory patients, of course - with a request that I should hypnotize them. Now I have not used hypnosis for therapeutic purposes for some eight years (except for a few special experiments) so that I habitually send back these cases with the recommendation that anyone who relies upon hypnosis may employ it himself. There is, actually, the greatest possible antithesis between suggestive and analytic technique - the same antithesis which, in regard to the fine arts, the great Leonardo da Vinci summed up in the formulas: *per via di porre* and *per via di levare*. Painting, says Leonardo, works *per via di porre*, for it applies a substance - particles of colour - where there was no thing before, on the colourless canvas; sculpture, however, proceeds *per via di levare*, since it takes away from the block of stone all that hides the surface of the statue contained in it. In a similar way, the technique of suggestion aims at proceeding *per via di porre*; it is not concerned with the origin, strength and meaning of the morbid symptoms, but instead, it superimposes something - a suggestion - in the expectation that it will be strong enough to restrain the pathogenic idea from coming to expression. Analytic therapy, on the other hand, does not seek to add or to introduce anything new, but to take away something, to bring out something; and to this end concerns itself with the genesis of the morbid symptoms and the psychical context of the pathogenic idea which it seeks to remove. It is by the use of this mode of investigation that analytic therapy has increased our knowledge so notably. I gave up the suggestive technique, and with it hypnosis, so early in my practice because I despaired of making suggestion powerful and enduring enough to effect permanent cures. In every severe case I saw the suggestions which had been applied crumble away again; after which the disease or some substitute for it was back once more. Besides all this I have another reproach to make against this method, namely, that it conceals from us all insight into the play of mental forces; it does not permit us, for example, to recognize the *resistance* with which the patient clings to his disease and thus even fights against his own recovery; yet it is this phenomenon of resistance which alone makes it possible to understand his behaviour in daily life.

(b) It seems to me that there is a widespread and erroneous impression among my colleagues that this technique of searching for the origins of an illness and removing its manifestations by that means is an easy one which can be practised off-hand, as it were. I conclude this from the fact that not one of all the people who have shown an interest in my therapy and passed definite judgements upon it has ever asked me how I actually go about it. There can be only one reason for this: that they think there is nothing to enquire about, that the thing is perfectly self-evident. Again, I am now and then astonished to hear that in this or that department of a hospital a young assistant has received an order from his chief to undertake a 'psycho-analysis' of a hysterical patient. I am sure he would not be allowed to examine an extirpated tumour unless he had convinced his chiefs that he was conversant with histological technique. Similarly, reports reach my ears that this or that colleague has arranged appointments with a patient in order to undertake a mental treatment of the case, though I am certain he knows nothing of the technique of any such therapy. His expectation must be therefore that the patient will make him a present of his secrets, or perhaps that he is looking for salvation in some sort of confession or confidence. I should not be surprised if a patient were injured rather than benefited by being treated in such a fashion. For it is not so easy to play upon the instrument of the mind. I am reminded on such occasions of the words of a world-famous neurotic - though it is true that he was never treated by a physician but existed only in a poet's imagination - Hamlet, Prince of Denmark. The King has ordered two courtiers, Rosenkranz and Guildenstern, to follow him, to question him and drag the secret of his depression out of him. He wards them off. Then some recorders are brought on the stage and Hamlet, taking one of them, begs one of his tormentors to play upon it, telling him that it is as easy as lying. The courtier excuses himself, for he knows no touch of the instrument, and when he cannot be persuaded to try it, Hamlet finally breaks out with these words: 'Why, look you now, how unworthy a thing you make of me! You would play upon me; . . . you would pluck out the heart of my mystery; you would sound me from my lowest note to the top of my compass; and there is much music, excellent voice, in this little organ; yet you cannot make it speak. *'Sblood, do you think I am easier to be played on than a pipe? Call me what instrument you will, though you can fret me, you cannot play upon me.'* (Act III, Scene 2.)

(c) From certain of my remarks you will have gathered that there are many characteristics in the analytic method which prevent it from being an ideal form of therapy. *Tuto, cito, jucunde*: investigation and probing do not indicate speedy results, and the resistance I have mentioned would prepare you to expect unpleasantness of various kinds. Psycho-analytic treatment certainly makes great demands upon the patient as well as upon the physician. From the patient it requires perfect sincerity - a sacrifice in itself; it absorbs time and is therefore also costly; for the physician it is no less time-absorbing, and the technique which he must study and practise is fairly laborious. I consider it quite justifiable to resort to more convenient methods of treatment as long as there is any prospect of achieving anything by their means. That, after all, is the only point at issue. If the more difficult and lengthy method accomplishes considerably more than the short and easy one, then, in spite of everything, the use of the former is justified. Only consider, Gentlemen, how much more inconvenient and costly is the Finsen therapy of lupus than the method of cauterizing and scraping previously employed; and yet the use of the former signifies a great advance, for it performs a radical cure. Although I do not wish to carry this comparison to extremes, the psycho-analytic method may claim a similar privilege. Actually, I have been able to elaborate and to test my therapeutic method only on severe, indeed on the severest cases; at first my material consisted entirely of patients who had tried everything else without success, and had spent long years in sanatoria. I have scarcely been able to bring together sufficient material to enable me to say how my method works with those slighter, episodic cases which we see recovering under all kinds of influences and even spontaneously. Psycho-analytic therapy was created through and for the treatment of patients permanently unfit for existence, and its triumph has been that it has made a satisfactorily large number of these permanently *fit* for existence. In the face of such an achievement all the effort expended seems trivial. We cannot conceal from ourselves what, as physicians, we are in the habit of denying to our patients, namely, that a severe neurosis is no less serious for the sufferer than any cachexia or any of the dreaded major diseases.

(d) The conditions under which this method is indicated, or contra-indicated, can scarcely be definitely laid down as yet, because of the many practical limitations to which my activities have been subjected. Nevertheless, I will attempt to discuss a few of them here:

(1) One should look beyond the patient's illness and form an estimate of his whole personality; those patients who do not possess a reasonable degree of education and a fairly reliable character should be refused. It must not be forgotten that there are healthy people as well as unhealthy ones who are good for nothing in life, and that there is a temptation to ascribe to their illness everything that incapacitates them, if they show any sign of neurosis. In my opinion a neurosis is by no means a stamp of degeneracy, though it may often enough be found in one person along with the signs of degeneracy. Now analytic psychotherapy is not a process suited to the treatment of neuropathic degeneracy; on the contrary, degeneracy is a barrier to its effectiveness. Nor is the method applicable to people who are not driven to seek treatment by their own sufferings, but who submit to it only because they are forced to by the authority of relatives. The qualification which is the determining factor of fitness for psycho-analytic treatment - that is, whether the patient is educable - must be discussed further from another standpoint.

(2) To be quite safe, one should limit one's choice of patients to those who possess a normal mental condition, since in the psycho-analytic method this is used as a foothold from which to obtain control of the morbid manifestations. Psychoses, states of confusion and deeply-rooted (I might say toxic) depression are therefore not suitable for psycho-analysis; at least not for the method as it has been practised up to the present. I do not regard it as by any means impossible that by suitable changes in the method we may succeed in overcoming this contraindication - and so be able to initiate a psychotherapy of the psychoses.

(3) The age of patients has this much importance in determining their fitness for psycho-analytic treatment, that, on the one hand, near or above the age of fifty the elasticity of the mental processes, on which the treatment depends, is as a rule lacking - old people are no longer educable - and, on the other hand, the mass of material to be dealt with would prolong the duration of the treatment indefinitely. In the other direction the age limit can be determined only individually; youthful persons under the age of adolescence are often exceedingly amenable to influence.

(4) Psycho-analysis should not be attempted when the speedy removal of dangerous symptoms is required, as, for example, in a case of hysterical anorexia.

By this time you will have formed an impression that the field of analytic psychotherapy is a very narrow one, since you have in fact heard nothing from me except indications that point against it. There remain, however, cases and types of disease enough on which this therapy may be tested - as, for instance, all chronic forms of hysteria with residual manifestations, the broad field of obsessive conditions, abouliias, and the like.

It is gratifying that precisely the most valuable and most highly developed persons are best suited for this procedure; and one may also safely claim that in cases where analytic psychotherapy has been able to achieve but little, any other therapy would certainly not have been able to effect anything at all.

(e) You will no doubt wish to enquire about the possibility of doing harm by undertaking a psycho-analysis. In reply to this I may say that if you are willing to judge impartially, if you will consider this procedure in the same spirit of critical fairness that you show to our other therapeutic methods, you will have to agree with me that no injury to the patient is to be feared when the treatment is conducted with comprehension. Anyone who is accustomed, like the lay public, to blame the treatment for whatever happens during an illness will doubtless judge differently. It is not so very long since the same prejudice was directed against our hydropathic establishments. Many patients who were advised to go into an establishment of that kind hesitated because they had known someone who had entered the place as a nervous invalid and had become insane there. As you may guess, these were cases of early general paralysis that could still in their first stage be sent to a hydropathic establishment; once there, they had run their inevitable course until manifest mental disorder supervened: but the public blamed the water for this disastrous change. When it is a matter of new kinds of therapeutic treatment even physicians are not always free from such errors of judgement. I recall once making an attempt at psychotherapy with a woman who had passed the greater part of her life in a state alternating between mania and melancholia. I took on the case at the close of a period of melancholia and for two weeks things seemed to go smoothly; in the third week we were already at the beginning of the next attack of mania. This was undoubtedly a spontaneous transformation of the clinical picture, since in two weeks analytic psychotherapy cannot accomplish anything. And yet the eminent physician (now deceased) who saw the case with me could not refrain from the remark that psychotherapy was probably to blame for this 'relapse'. I am quite convinced that in other circumstances he would have shown a more critical judgement.

(f) Finally, Gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psycho-analytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this: This therapy, then, is based on the recognition that unconscious ideas - or better, the unconsciousness of certain mental processes - are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious *idée fixe*. Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of 'unconscious mental processes'. If, however, you will look at the matter from our point of view, you will understand that the transformation of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious will-power governs only conscious mental processes, and every mental compulsion is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses.

There is, however, another angle from which you may seek to understand the psycho-analytic method. The uncovering and translating of the unconscious occurs in the face of a continuous *resistance* on the part of the patient. The process of bringing this unconscious material to light is associated with unpleasure, and because of this the patient rejects it again and again. It is for you then to interpose in this conflict in the patient's mental life. If you succeed in persuading him to accept, by virtue of a better understanding, something that up to now, in consequence of this automatic regulation by unpleasure, he has rejected (repressed), you will have accomplished something towards his education. For it is education even to induce someone who dislikes getting up early to do so all the same. Psycho-analytic treatment may in general be conceived of as such a *re-education in overcoming internal resistances*. Re-education of this kind is, however, in no respect more necessary to nervous patients than in regard to the mental element in their sexual life. For nowhere else have civilization and education done so much harm as in this field, and this is the point, as experience will show you, at which to look for those aetiologies of the neuroses that are amenable to influence; for the other aetiological factor, the constitutional component, consists of something fixed and unalterable. And from this it follows that one important qualification is required of the physician in this work: not only must his own character be irreproachable - 'As to morals, that goes without saying', as the hero of Vischer's novel *Auch Einer* was in the habit of declaring - but he must also have overcome in his own mind that mixture of prurience and prudery with which, unfortunately, so many people habitually consider sexual problems.

At this juncture another remark is perhaps not out of place. I know that the emphasis which I lay upon the part played by sexuality in creating the psychoneuroses has become generally known. But I know, too, that qualifications and exact particularization are of little use with the general public; there is very little room in the memory of the multitude; it only retains the bare gist of any thesis and fabricates an extreme version which is easy to remember. It may be, too, that some physicians vaguely apprehend the content of my doctrine to be that I regard sexual privation as the ultimate cause of the neuroses. In the conditions of life in modern society there is certainly no lack of sexual privation. On this basis, would it not be simpler to aim directly at recovery by recommending sexual activity as a therapeutic measure, instead of pursuing the circuitous and laborious path of mental treatment?(I know of nothing which could impel me to suppress such an inference if it were justified. The real state of things, however, is otherwise. Sexual need and privation are merely one factor at work in the mechanism of neurosis; if there were no others the result would be dissipation, not disease. The other, no less essential, factor, which is all too readily forgotten, is the neurotic's aversion from sexuality, his incapacity for loving, that feature of the mind which I have called 'repression'. Not until there is a conflict between the two tendencies does nervous illness break out, and therefore to advise sexual activity in the psychoneuroses can only very rarely be described as good advice.

Let me end upon this defensive note. And let us hope that your interest in psychotherapy, when freed from every hostile prejudice, may lend us support in our endeavour to achieve success in treating even severe cases of psychoneurosis.

MY VIEWS ON THE PART PLAYED BY SEXUALITY
IN THE AETIOLOGY OF THE NEUROSES
(1906)

Intentionally left blank

MY VIEWS ON THE PART PLAYED BY SEXUALITY IN THE AETIOLOGY OF THE NEUROSES

My theory of the aetiological importance of the sexual factor in the neuroses can best be appreciated, in my opinion, by following the history of its development. For I have no desire whatever to deny that it has gone through a process of evolution and been modified in the course of it. My professional colleagues may find a guarantee in this admission that the theory is nothing other than the product of continuous and ever deeper-going experience. What is born of speculation, on the contrary, may easily spring into existence complete and there after remain unchangeable.

Originally my theory related only to the clinical pictures comprised under the term 'neurasthenia', among which I was particularly struck by two, which occasionally appear as pure types and which I described as 'neurasthenia proper' and 'anxiety neurosis'. It had, to be sure, always been a matter of common knowledge that sexual factors *may* play a part in the causation of these forms of illness; but those factors were not regarded as invariably operative, nor was there any idea of giving them precedence over other aetiological influences. I was surprised to begin with at the frequency of gross disturbances in the *vita sexualis* of nervous patients; the more I set about looking for such disturbances - bearing in mind the fact that everyone hides the truth in matters of sex - and the more skilful I became at pursuing my enquiries in the face of a preliminary denial, the more regularly was I able to discover pathogenic factors in sexual life, till little seemed to stand in the way of my assuming their universal occurrence. It was necessary, however, to presuppose from the start that sexual irregularities occurred with similar frequency in our ordinary society under the pressure of social conditions; and a doubt might remain as to the degree of deviation from normal sexual functioning which should be regarded as pathogenic. I was therefore obliged to attach less importance to the invariable evidence of sexual noxae than to a second discovery which seemed to me less ambiguous. It emerged that the form taken by the illness - neurasthenia or anxiety neurosis - bore a constant relation to the nature of the sexual noxa involved. In typical cases of neurasthenia a history of regular masturbation or persistent emissions was found; in anxiety neurosis factors appeared such as *coitus interruptus*, 'unconsummated excitation', and other conditions - in all of which there seemed to be the common element of an insufficient discharge of the libido that had been produced. It was only after this discovery, which was easy to make and could be confirmed as often as one liked, that I had the courage to claim a preferential position for sexual influences in the aetiology of the neuroses. Furthermore, in the mixed forms of neurasthenia and anxiety neurosis which are so common it was possible to trace a combination of the aetiologies which I had assumed for the two pure forms. Moreover, this twofold form assumed by the neurosis seemed to tally with the polar (i.e. the masculine and feminine) character of sexuality.

At the time at which I was attributing to sexuality this important part in the production of the *simple* neuroses,¹ I was still faithful to a purely psychological theory in regard to the *psychoneuroses* - a theory in which the sexual factor was regarded as no more significant than any other emotional source of feeling. On the basis of some observations made by Josef Breuer on a hysterical patient more than ten years earlier, I collaborated with him in a study of the mechanism of the generation of hysterical symptoms, using the method of awakening the patient's memories in a state of hypnosis; and we reached conclusions which enabled us to bridge the gap between Charcot's traumatic hysteria and common non-traumatic hysteria (Breuer and Freud, 1895). We were led to the assumption that hysterical symptoms are the permanent results of psychical traumas, the sum of affect attaching to which has, for particular reasons, been prevented from being worked over consciously and has therefore found an abnormal path into somatic innervation. The terms 'strangled affect', 'conversion' and 'abreaction' cover the distinctive features of this hypothesis.

But in view of the close connections between the psychoneuroses and the simple neuroses, which go so far, indeed, that a differential diagnosis is not always easy for inexperienced observers, it could not be long before the knowledge arrived at in the one field was extended to the other. Moreover, apart from this consideration, a deeper investigation of the psychical mechanism of hysterical symptoms led to the same result. For if the psychical traumas from which the hysterical symptoms were derived were pursued further and further by means of the 'cathartic' procedure initiated by Breuer and me, experiences were eventually reached which belonged to the patient's childhood and related to his sexual life. And this was so, even in cases in which the onset of the illness had been brought about by some commonplace emotion of a non-sexual kind. Unless these sexual traumas of childhood were taken into account it was impossible either to elucidate the symptoms (to understand the way in which they were determined) or to prevent their recurrence. In this way the unique significance of sexual experiences in the aetiology of the psychoneuroses seemed to be established beyond a doubt; and this fact remains to this day one of the corner-stones of my theory.

¹ In my paper on anxiety neurosis (1895*b*).

This theory might be expressed by saying that the cause of life-long hysterical neuroses lies in what are in themselves for the most part the trivial sexual experiences of early childhood; and, put in this way, it might no doubt sound strange. But if we take the historical development of the theory into account, and see as its essence the proposition that hysteria is the expression of a particular behaviour of the individual's sexual function and that this behaviour is decisively determined by the first influences and experiences brought to bear in childhood, we shall be a paradox the poorer but the richer by a motive for turning our attention to something of the highest importance (though it has hitherto been grossly neglected) - the after-effects of the impressions of childhood.

I will postpone until later in this paper a more thorough going discussion of the question whether we are to regard the sexual experiences of childhood as the causes of hysteria (and obsessional neurosis), and I will now return to the form taken by the theory in some of my shorter preliminary publications during the years 1895 and 1896 (Freud, 1896*b* and 1896*c*). By laying stress on the supposed aetiological factors it was possible at that time to draw a contrast between the common neuroses as disorders with a *contemporary* aetiology and psychoneuroses whose aetiology was chiefly to be looked for in the sexual experiences of the remote past. The theory culminated in this thesis: if the *vita sexualis* is normal, there can be no neurosis.

Though even to-day I do not consider these assertions incorrect, it is not to be wondered at that, in the course of ten years of continuous effort at reaching an understanding of these phenomena, I have made a considerable step forward from the views I then held, and now believe that I am in a position, on the basis of deeper experience, to correct the insufficiencies, the displacements and the misunderstandings under which my theory then laboured. At that time my material was still scanty, and it happened by chance to include a disproportionately large number of cases in which sexual seduction by an adult or by older children played the chief part in the history of the patient's childhood. I thus over-estimated the frequency of such events (though in other respects they were not open to doubt). Moreover, I was at that period unable to distinguish with certainty between falsifications made by hysterics in their memories of childhood and traces of real events. Since then I have learned to explain a number of phantasies of seduction as attempts at fending off memories of the subject's *own* sexual activity (infantile masturbation). When this point had been clarified, the 'traumatic' element in the sexual experiences of childhood lost its importance and what was left was the realization that infantile sexual activity (whether spontaneous or provoked) prescribes the direction that will be taken by later sexual life after maturity. The same clarification (which corrected the most important of my early mistakes) also made it necessary to modify my view of the mechanism of hysterical symptoms. They were now no longer to be regarded as direct derivatives of the repressed memories of childhood experiences; but between the symptoms and the childish impressions there were inserted the patient's *phantasies* (or imaginary memories), mostly produced during the years of puberty, which on the one side were built up out of and over the childhood memories and on the other side were transformed directly into the symptoms. It was only after the introduction of this element of hysterical phantasies that the texture of the neurosis and its relation to the patient's life became intelligible; a surprising analogy came to light, too, between these unconscious phantasies of hysterics and the imaginary creations of paranoics which become conscious as delusions.

After I had made this correction, 'infantile sexual traumas' were in a sense replaced by the 'infantilism of sexuality'. A second modification of the original theory lay not far off. Along with the supposed frequency of seduction in childhood, I ceased also to lay exaggerated stress on the *accidental* influencing of sexuality on to which I had sought to thrust the main responsibility for the causation of the illness, though I had not on that account denied the constitutional and hereditary factors. I had even hoped to solve the problem of choice of neurosis (the decision to which form of psychoneurosis the patient is to fall a victim) by reference to the details of the sexual experiences of childhood. I believed at that time - though with reservations - that a passive attitude in these scenes produced a predisposition to hysteria and, on the other hand, an active one a predisposition to obsessional neurosis. Later on I was obliged to abandon this view entirely, even though some facts demand that in some way or other the supposed correlation between passivity and hysteria and between activity and obsessional neurosis shall be maintained. Accidental influences derived from experience having thus receded into the background, the factors of constitution and heredity necessarily gained the upper hand once more; but there was this difference between my views and those prevailing in other quarters, that on my theory the 'sexual constitution' took the place of a 'general neuropathic disposition'. In my recently published *Three Essays on the Theory of Sexuality* (1905d) I have tried to give a picture of the variegated nature of this sexual constitution as well as of the composite character of the sexual instinct in general and its derivation from contributory sources from different parts of the organism.

As a further corollary to my modified view of 'sexual traumas in childhood', my theory now developed further in a direction which had already been indicated in my publications between 1894 and 1896. At that time, and even before sexuality had been given its rightful place as an aetiological factor, I had maintained that no experience could have a pathogenic effect unless it appeared intolerable to the subject's ego and gave rise to efforts at defence (Freud, 1894a). It was to this defence that I traced back the split in the psyche (or, as we said in those days, in consciousness) which occurs in hysteria. If the defence was successful, the intolerable experience with its affective consequences was expelled from consciousness and from the ego's memory. In certain circumstances, however, what had been expelled pursued its activities in what was now an unconscious state, and found its way back into consciousness by means of symptoms and the affects attaching to them, so that the illness corresponded to a failure in defence. This view had the merit of entering into the interplay of the psychical forces and of thus bringing the mental processes in hysteria nearer to normal ones, instead of characterizing the neurosis as nothing more than a mysterious disorder insusceptible to further analysis.

Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of *their* childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence'). Thus it was no longer a question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences - of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced by the demands of real life, and the psycho-analyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

I could not further elucidate this part of my theory without a detailed discussion of my views on repression. It will be enough here to refer to my *Three Essays* (1905d), in which I have attempted to throw some light - if only a feeble one - on the somatic processes in which the essential nature of sexuality is to be looked for. I have there shown that the constitutional sexual disposition of children is incomparably more variegated than might have been expected, that it deserves to be described as 'polymorphously perverse' and that what is spoken of as the normal behaviour of the sexual function emerges from this disposition after certain of its components have been repressed. By pointing out the infantile elements in sexuality I was able to establish a simple correlation between health, perversion and neurosis. I showed that *normality* is a result of the repression of certain component instincts and constituents of the infantile disposition and of the subordination of the remaining constituents under the primacy of the genital zones in the service of the reproductive function. I showed that *perversions* correspond to disturbances of this coalescence owing to the overpowering and compulsive development of certain of the component instincts, while *neuroses* can be traced back to an excessive repression of the libidinal trends. Since almost all the perverse instincts of the infantile disposition can be recognized as the forces concerned in the formation of symptoms in neuroses, though in a state of repression, I was able to describe neurosis as being the 'negative' of perversion.

I think it is worth emphasizing the fact that, whatever modifications my views on the aetiology of the psychoneuroses have passed through, there are two positions which I have never repudiated or abandoned - the importance of sexuality and of infantilism. Apart from this, accidental influences have been replaced by constitutional factors and 'defence' in the purely psychological sense has been replaced by organic 'sexual repression'. The question may, however, be raised of where convincing evidence is to be found in favour of the alleged aetiological importance of sexual factors in the psychoneuroses, in view of the fact that the onset of these illnesses may be observed in response to the most commonplace emotions or even to somatic precipitating causes, and since I have had to abandon a specific aetiology depending on the particular form of the childhood experiences concerned. To such a question I would reply that the psycho-analytic examination of neurotics is the source from which this disputed conviction of mine is derived. If we make use of that irreplaceable method of research, we discover that *the patient's symptoms constitute his sexual activity* (whether wholly or in part), which arises from the sources of the normal or perverse component instincts of sexuality. Not only is a large part of the symptomatology of hysteria derived directly from expressions of sexual excitement, not only do a number of erotogenic zones attain the significance of genitals during neuroses owing to an intensification of infantile characteristics, but the most complicated symptoms are themselves revealed as representing, by means of 'conversion', phantasies which have a sexual situation as their subject-matter. Anyone who knows how to interpret the language of hysteria will recognize that the neurosis is concerned only with the patient's repressed sexuality. The sexual function must, however, be understood in its true extent, as it is laid down by disposition in infancy. Wherever some commonplace emotion must be included among the determinants of the onset of the illness, analysis invariably shows that it is the sexual component of the traumatic experience - a component that is never lacking which has produced the pathogenic result.

We have been led on imperceptibly from the question of the causation of the psychoneuroses to the problem of their essential nature. If we are prepared to take into account what has been learnt from psycho-analysis, we can only say that the essence of these illnesses lies in disturbances of the sexual processes, the processes which determine in the organism the formation and utilization of sexual libido. It is scarcely possible to avoid picturing these processes as being in the last resort of a chemical nature; so that in what are termed the 'actual' neuroses we may recognize the *somatic* effects of disturbances of the sexual metabolism, and in the psychoneuroses the *psychical* effects of those disturbances as well. The similarity of the neuroses to the phenomena of intoxication and abstinence after the use of certain alkaloids, as well as to Graves' disease and Addison's disease, is forced upon our notice clinically. And just as these last two illnesses should no longer be described as 'nervous diseases', so also the 'neuroses' proper, in spite of their name, may soon have to be excluded from that category as well.

Accordingly, the aetiology of the neuroses comprises everything which can act in a detrimental manner upon the processes serving the sexual function. In the forefront, then, are to be ranked the noxae which affect the sexual function itself - in so far as these are regarded as injurious by the sexual constitution, varying as it does with different degrees of culture and education. In the next place comes every other kind of noxa and trauma which, by causing general damage to the organism, may lead secondarily to injury to its sexual processes. It should not, however, be forgotten that the aetiological problem in the case of the neuroses is at least as complicated as the causative factors of any other illness. A single pathogenic influence is scarcely ever sufficient; in the large majority of cases a *number* of aetiological factors are required, which support one another and must therefore not be regarded as being in mutual opposition. For this reason a state of neurotic illness cannot be sharply differentiated from health. The onset of the illness is the product of a summation and the necessary total of aetiological determinants can be completed from any direction. To look for the aetiology of the neuroses exclusively in heredity or in the constitution would be just as one-sided as to attribute that aetiology solely to the accidental influences brought to bear upon sexuality in the course of the subject's life - whereas better insight shows that the essence of these illnesses lies solely in a disturbance of the organism's sexual processes.

VIENNA, *June* 1905.

PSYCHICAL (OR MENTAL) TREATMENT
(1890)

Intentionally left blank

PSYCHICAL (OR MENTAL) TREATMENT

'Psyche' is a Greek word which may be translated 'mind'. Thus 'psychical treatment' means 'mental treatment'. The term might accordingly be supposed to signify 'treatment of the pathological phenomena of mental life'. This, however, is *not* its meaning. 'Psychical treatment' denotes, rather, treatment taking its start in the mind, treatment (whether of mental or physical disorders) by measures which operate in the first instance and immediately upon the human mind.

Foremost among such measures is the use of words; and words are the essential tool of mental treatment. A layman will no doubt find it hard to understand how pathological disorders of the body and mind can be eliminated by 'mere' words. He will feel that he is being asked to believe in magic. And he will not be so very wrong, for the words which we use in our everyday speech are nothing other than watered-down magic. But we shall have to follow a roundabout path in order to explain how science sets about restoring to words a part at least of their former magical power.

It is only comparatively recently, too, that physicians with a scientific training have learnt to appreciate the value of mental treatment. And we can easily see why this was so when we reflect on the evolution of medicine during the last half-century. After a somewhat unfruitful period during which it was dependent on what was known as 'Natural Philosophy', it came under the happy influence of the natural sciences and has achieved the greatest advances alike as a science and as an art: it has shown that the organism is built up from microscopically small elements (the cells), it has learnt to understand the physics and chemistry of the various vital processes (functions), it has distinguished the visible and observable modifications which are brought about in the bodily organs by different morbid processes, and has discovered, on the other hand, the signs that reveal the operation of deep-lying morbid processes in the living body; moreover it has identified a great number of the micro-organisms which cause illness and, with the help of its newly acquired knowledge, it has reduced to a quite extraordinary degree the dangers arising from severe surgical operations. All of these advances and discoveries were related to the *physical* side of man, and it followed, as a result of an incorrect though easily understandable trend of thought, that physicians came to restrict their interest to the physical side of things and were glad to leave the mental field to be dealt with by the philosophers whom they despised.

Modern medicine, it is true, had reason enough for studying the indisputable connection between the body and the mind; but it never ceased to represent mental events as determined by physical ones and dependent on them. Thus stress was laid on the fact that intellectual functioning was conditional upon the presence of a normally developed and sufficiently nourished brain, that any disease of that organ led to disturbances of intellectual functioning, that the introduction of toxic substances into the circulation could produce certain states of mental illness, or - to descend to more trivial matters - that dreams could be modified by stimuli brought to bear upon a sleeper for experimental purposes.

The relation between body and mind (in animals no less than in human beings) is a reciprocal one; but in earlier times the other side of this relation, the effect of the mind upon the body, found little favour in the eyes of physicians. They seemed to be afraid of granting mental life any independence, for fear of that implying an abandonment of the scientific ground on which they stood.

This one-sided attitude of medicine towards the body has undergone a gradual change in the course of the last decade and a half, a change brought about directly by clinical experience. There are a large number of patients, suffering from affections of greater or less severity, whose disorders and complaints make great demands on the skill of their physicians, but in whom no visible or observable signs of a pathological process can be discovered either during their life or after their death, in spite of all the advances in the methods of investigation made by scientific medicine. One group of these patients are distinguished by the copiousness and variety of their symptoms: they are incapable of intellectual work because of headaches or inability to concentrate their attention, their eyes ache when they read, their legs become fatigued when they walk, develop dull pains or go to sleep, their digestion is disturbed by distressing sensations, by eructations or gastric spasms, they cannot defaecate without aperients, they are subject to sleeplessness, and so on. They may suffer from all these disorders simultaneously or in succession, or from only a selection of them; but in every case the illness is evidently the same. Moreover, its signs are often variable and replace one another. A patient who has hitherto been incapacitated by headaches but has had a fairly good digestion may next day enjoy a clear head but may thenceforward be unable to manage most kinds of food. Again, his sufferings may suddenly cease if there is a marked change in the circumstances of his existence. If he is travelling he may feel perfectly well and be able to enjoy the most varied diet without any ill effects, but when he gets home he may once more have to restrict himself to sour milk. In a few cases the disorder - whether it is a pain or a weakness resembling a paralysis - may suddenly pass from one side of the body to the other: it may jump from his right side to the corresponding part of the body on his left side. But in every instance it is to be observed that the symptoms are very clearly influenced by excitement, emotion, worry, etc., and also that they can disappear and give place to perfect health without leaving any traces, even if they have persisted over a long period.

Medical research has at last shown that people of this kind are not to be looked upon as suffering from a disease of the stomach or of the eyes or whatever it may be, but that it must be a question in their case of an illness of the nervous system as a whole. Examination of the brain and nerves of these patients has so far, however, revealed no perceptible changes; and, indeed, some of the features of their symptomatology prohibit any expectation that even more accurate methods of investigation could ever discover changes of a sort that would throw light upon the illness. This condition has been described as 'nervousness' (neurasthenia or hysteria) and has been characterized as a merely 'functional' disorder of the nervous system.¹ Incidentally, an exhaustive examination of the brain (after the patient's death) has been equally without results in the case of many more permanent nervous disorders, as well as in illnesses with exclusively mental symptoms, such as what are known as obsessions and delusional insanity.

¹ See Volume II, Part X, Chapter 4 [of the work, *Die Gesundheit*, in which this paper of Freud's first appeared.]

Physicians were thus faced by the problem of investigating the nature and origin of the symptoms shown by these nervous or neurotic patients. In the course of this investigation it was found that in some at least of these patients the signs of their illness originate from nothing other than *a change in the action of their minds upon their bodies* and that the immediate cause of their disorder is to be looked for in their minds. What may be the remoter causes of the disturbance which affects their minds is another question, with which we need not now concern ourselves. But medical science was here provided with an opportunity for directing its full attention to what had previously been the neglected side of the mutual relation between body and mind.

It is not until we have studied pathological phenomena that we can get an insight into normal ones. Many things which had long been known of the influence of the mind on the body were only now brought into their true perspective. The commonest, everyday example of the mind's action on the body, and one that is to be observed in everyone, is offered by what is known as the 'expression of the emotions'. A man's states of mind are manifested, almost without exception, in the tensions and relaxations of his facial muscles, in the adaptations of his eyes, in the amount of blood in the vessels of his skin, in the modifications in his vocal apparatus and in the movements of his limbs and in particular of his hands. These concomitant physical changes are for the most part of no advantage to the person concerned; on the contrary, they often stand in his way if he wishes to conceal his mental processes from other people. But they serve these other people as trustworthy indications from which his mental processes can be inferred and in which more confidence can be placed than in any simultaneous verbal expressions that may be made deliberately. If we are able to submit anyone to a more accurate examination during certain of his mental activities, we come upon further physical consequences, in the shape of changes in his heart-action, alterations in the distribution of blood in his body, and so on.

In certain mental states described as 'affects', the part played by the body is so obvious and on so large a scale that some psychologists have even adopted the view that the essence of these affects consists only in their physical manifestations. It is a matter of common knowledge that extraordinary changes occur in the facial expression, in the circulation, in the excretions and in the state of tension of the voluntary muscles under the influence of fear, of rage, of mental pain and of sexual delight. What is less well known, though equally well established, is the occurrence of other physical results of the affects which cannot be counted as their expression. Persistent affective states of a distressing or 'depressive' nature (as they are called), such as sorrow, worry or grief, reduce the state of nourishment of the whole body, cause the hair to turn white, the fat to disappear and the walls of the blood-vessels to undergo morbid changes. On the other hand, under the influence of feelings of joy, of 'happiness', we find that the whole body blossoms out and shows signs of a renewal of youth. The major affects evidently have a large bearing on the capacity to resist infectious illness; a good example of this is to be seen in the medical observation that there is a far greater liability to contract such diseases as typhus and dysentery in defeated armies than in victorious ones. The affects, moreover, - this applies almost exclusively to depressive affects - are often sufficient in themselves to bring about both diseases of the nervous system accompanied by manifest anatomical changes and also diseases of other organs. In such cases it must be assumed that the patient already had a predisposition, though hitherto an inoperative one, to the disease in question.

States of illness that are already present can be very considerably influenced by violent affects. Such changes are usually for the worse; but there is no lack of instances in which a severe shock or a sudden bereavement brings about a peculiar alteration in the tone of the organism which may have a favourable influence on some well-established pathological condition or may even bring it to an end. Finally, there can be no doubt that the duration of life can be appreciably shortened by depressive affects and that a violent shock, or a deep humiliation or disgrace, may put a sudden end to life. Strange to say, this same result may be found to follow too from the unexpected impact of a great joy.

The affects in the narrower sense are, it is true, characterized by a quite special connection with somatic processes; but, strictly speaking, all mental states, including those that we usually regard as 'processes of thought', are to some degree 'affective', and not one of them is without its physical manifestations or is incapable of modifying somatic processes. Even when a person is engaged in quietly thinking in a string of 'ideas', there are a constant series of excitations, corresponding to the content of these ideas, which are discharged into the smooth or striated muscles. These excitations can be made apparent if they are appropriately reinforced, and certain striking and, indeed, ostensibly 'supernatural' phenomena can be explained by this means. Thus, what is known as 'thought-reading' [*Gedanken erraten*] may be explained by small, involuntary muscular movements carried out by the 'medium' in the course of an experiment - when, for instance, he has to make someone discover a hidden object. The whole phenomenon might more suitably be described as 'thought-betraying' [*Gedanken verraten*].

The processes of volition and attention are also capable of exercising a profound effect on somatic processes and of playing a large part in promoting or hindering physical illnesses. A famous English physician has reported that he can succeed in producing a great variety of sensations and pains in any part of his body to which he may choose to direct his attention, and the majority of people appear to behave similarly. It is in general true that in forming a judgement of pains (which are usually regarded as physical phenomena) we must bear in mind their unmistakable dependence upon mental determinants. Laymen, who like to sum up mental influences of this kind under the name of 'imagination', are inclined to have little respect for pains that are due to imagination as contrasted with those caused by injury, illness or inflammation. But this is clearly unjust. However pains may be caused - even by imagination - they themselves are no less real and no less violent on that account.

Just as pains are produced or increased by having attention paid to them, so, too, they disappear if attention is diverted from them. This experience can always be employed as a means of soothing children; adult soldiers do not feel the pain of a wound in the feverish heat of battle; martyrs are probably quite impervious to the pain of their tortures in the over-excitement of their religious feeling and in the concentration of all their thoughts upon the heavenly reward that awaits them. It is not so easy to produce evidence of the influence of *volition* on pathological somatic processes; but it is quite possible that a determination to recover or a will to die may have an effect on the outcome even of severe and precarious illnesses.

Our interest is most particularly engaged by the mental state of *expectation*, which puts in motion a number of mental forces that have the greatest influence on the onset and cure of physical diseases. *Fearful* expectation is certainly not without its effect on the result. It would be of importance to know with certainty whether it has as great a bearing as is supposed on falling ill; for instance, whether it is true that during an epidemic those who are afraid of contracting the illness are in the greatest danger. The contrary state of mind, in which expectation is coloured by hope and faith, is an effective force with which we have to reckon, strictly speaking, in *all* our attempts at treatment and cure. We could not otherwise account for the peculiar results which we find produced by medicaments and therapeutic procedures.

The most noticeable effects of this kind of expectation coloured by faith are to be found in the 'miraculous' cures which are brought about even to-day under our own eyes without the help of any medical skill. Miraculous cures properly so-called take place in the case of believers under the influence of adjuncts calculated to intensify religious feelings - that is to say, in places where a miracle-working image is worshipped, or where a holy or divine personage has revealed himself to men and has promised them relief from their sufferings in return for their worship, or where the relics of a saint are preserved as a treasure. Religious faith alone does not seem to find it easy to suppress illness by means of expectation; for as a rule other contrivances as well are brought into play in the case of miraculous cures. The times and seasons at which divine mercy is sought must be specially indicated; the patient must submit to physical toil, to the trials and sacrifices of a pilgrimage, before he can become worthy of this divine mercy.

It would be convenient, but quite wrong, simply to refuse all credence to these miraculous cures and to seek to explain the accounts of them as a combination of pious fraud and inaccurate observation. Though an explanation of this kind may often be justified, it is not enough to enable us to dismiss entirely the fact of miraculous cures. They do really occur and have occurred at every period of history. And they concern not merely illnesses of mental origin - those, that is, which are based on 'imagination' and are therefore likely to be especially affected by the circumstances of a pilgrimage - but also illnesses with an 'organic' basis which had previously resisted all the efforts of physicians.

There is no need, however, to bring forward anything other than mental forces in order to explain miraculous cures. Even under conditions such as these, nothing happens that can be considered as beyond our understanding. Everything proceeds naturally. Indeed, the power of religious faith is reinforced in these cases by a number of eminently human motive forces. The individual's pious belief is intensified by the enthusiasm of the crowd of people in whose midst he makes his way as a rule to the sacred locality. All the mental impulses of an individual can be enormously magnified by group influence such as this. In cases in which someone proceeds to the holy place by himself, the reputation of the place and the respect in which it is held act as substitutes for the influence of the group, so that in fact the power of a group is once more in operation. And there is yet another way in which this influence makes itself felt. Since it is well known that divine mercy is always shown only to a few of the many who seek it, each of these is eager to be among the chosen few; the ambition that lies hidden in everyone comes to the help of pious faith. Where so many powerful forces converge, we need feel no surprise if the goal is sometimes really reached.

Even those who are without religious faith need not forgo miraculous cures. In their case reputation and group-influence act as a complete substitute for faith. There are always fashionable treatments and fashionable physicians, and these play an especially dominant part in high society, where the most powerful psychological motive forces are the endeavour to excel and to do what the 'best' people do. Fashionable treatments of this kind produce therapeutic results which are outside the scope of their actual power, and the same procedures effect far more in the hands of a fashionable doctor (who, for instance, may have become well-known as an attendant upon some prominent personality) than in those of another physician. Thus there are human as well as divine miracle-workers. Such men, however, who have reached eminence owing to the favour of fashion and of imitation, soon lose their power, as is to be expected from the nature of the forces which give it to them.

An intelligible dissatisfaction with the frequent inadequacy of the help afforded by medical skill, and perhaps, too, an internal rebellion against the duress of scientific thought, which reflects the remorselessness of nature, have in all periods (and in our own once more) imposed a strange condition on the therapeutic powers alike of persons and of procedures. The necessary faith only emerges if the practitioner is not a doctor, if he can boast of having no knowledge of the scientific basis of therapeutics, if the procedure has not been subjected to accurate testing but is recommended by some popular prejudice. Hence it is that we find a swarm of 'nature cures' and 'nature healers', who compete with physicians in the exercise of their profession and of whom we can at least say with some degree of certainty that they do far more harm than good. If this gives us grounds for blaming the patients' faith, we must yet not be so ungrateful as to forget that the same force is constantly at work in support of our own medical efforts. The results of every procedure laid down by the physician and of every treatment that he undertakes are probably composed of two portions. And one of these, which is sometimes greater and sometimes less, but can never be completely disregarded, is determined by the patient's mental attitude. The faith with which he meets the immediate effect of a medical procedure depends on the one hand on the amount of his own desire to be cured, and on the other hand on his confidence that he has taken the right steps in that direction - of his general respect, that is, for medical skill - and, further, on the power which he attributes to his doctor's personality, and even on the purely human liking aroused in him by the doctor. There are some physicians who have a greater capacity than others for winning their patients' confidence; a patient will often feel better the very moment the doctor enters his room.

Physicians have practised mental treatment from the beginning of time, and in early days to a far greater extent even than to-day. If by mental treatment we mean an endeavour to produce such mental states and conditions in the patient as will be the most propitious for his recovery, this kind of medical treatment is historically the oldest. Psychical treatment was almost the only sort at the disposal of the peoples of antiquity, and they invariably reinforced the effects of therapeutic potions and other therapeutic measures by intensive mental treatment. Such familiar procedures as the use of magical formulas and purificatory baths, or the elicitation of oracular dreams by sleeping in the temple precincts, can only have had a curative effect by psychical means. The physician's personality acquired a reputation derived directly from divine power, since in its beginnings the art of healing lay in the hands of priests. So that then as now the physician's personality was one of the chief instruments for bringing the patient into a state of mind favourable for his recovery.

Now, too, we begin to understand the 'magic' of words. Words are the most important media by which one man seeks to bring his influence to bear on another; words are a good method of producing mental changes in the person to whom they are addressed. So that there is no longer anything puzzling in the assertion that the magic of words can remove the symptoms of illness, and especially such as are themselves founded on mental states.

All the mental influences which have proved effective in curing illnesses have something incalculable about them. Affects, concentration of the will, distracting the attention, expectation coloured by faith - all of these forces, which occasionally remove an illness, sometimes fail to do so without there being anything in the character of the illness to account for the different result. What stands in the way of regularity in the therapeutic results achieved is evidently the autocratic nature of the personalities of the subjects, with their variety of mental differences. Since physicians came to realize clearly the important part played in recovery by the patient's state of mind, the idea naturally occurred to them of no longer leaving it to the patient to decide how much mental compliance he should show but of deliberately imposing a propitious state of mind by suitable methods. It is from this attempt that modern mental treatment has taken its start.

Quite a number of different methods of treatment have thus arisen, some of them simple to arrive at and others which could only be reached on the basis of complex hypotheses. It is easy to see, for instance, that the physician, who can no longer command respect as a priest or as the possessor of secret knowledge, should use his personality in such a way as to gain his patient's confidence and, to some degree, his affection. He himself may succeed in doing this with only a limited number of patients, whereas other patients, according to their inclinations and degree of education, will be attracted to other physicians. Such a distribution will serve a useful purpose; but *if the right of a patient to make a free choice of his doctor were suspended, an important precondition for influencing him mentally would be abolished.*

There are many very effective mental procedures which the physician is obliged to renounce. He either has not the power or has not the right to invoke them. This applies in particular to the provocation of strong affects - the most powerful of all the means by which the mind affects the body. The vicissitudes of life often cure illnesses through the experience of great joy, through the satisfaction of needs or the fulfilment of wishes. The physician, who is often impotent outside his profession, cannot compete along these lines. It might be more within his power to employ fear and fright for therapeutic ends; but, except in the case of children, he must have the gravest doubts about the use of such double-edged tools. On the other hand, the physician must rule out any relations with his patient that are bound up with tender feelings, owing to their implications in practical life. Thus from the first his power to bring about mental changes in his patients seems so restricted that mental treatment conducted on a deliberate plan would seem to offer no advantages over the earlier haphazard method.

The physician can seek to direct his patient's volition and attention, and he has good grounds for doing so in the case of various pathological conditions. He may, for instance, persistently oblige a person who believes he is paralysed to carry out the movements of which he professes himself incapable; or he may refuse to fall in with the wishes of an anxious patient who insists on being examined for an illness from which he is quite certainly not suffering. In these instances the physician will be taking the right course, but such isolated cases would scarcely justify us in setting up mental treatment as a special therapeutic procedure. There exists, nevertheless, a queer and unforeseeable method which offers the physician a possibility of exercising a profound, even though transitory, influence on the mental life of his patients and of employing that influence for therapeutic purposes.

It has long been known, though it has only been established beyond all doubt during the last few decades, that it is possible, by certain gentle means, to put people into a quite peculiar mental state very similar to sleep and on that account described as 'hypnosis'. The various means by which hypnosis can be brought about have at first sight little in common. It is possible to hypnotize someone by getting him to stare fixedly at a bright object for some minutes, or by holding a watch to his ear for a similar length of time, or by repeatedly passing the open hands, at a short distance away, over his face and limbs. But the same result can be brought about by describing the onset of the state of hypnosis and its characteristics quietly and firmly to the subject - that is, by 'talking him into' hypnosis. The two procedures may also be combined. We may make the subject sit down, hold a finger in front of his eyes, tell him to gaze at it fixedly and then say to him: 'You're feeling tired. Your eyes are closing; you can't hold them open. Your limbs are heavy; you can't move them any more. You're falling asleep---' and so on. It will be observed that all the procedures have in common a fixing of the attention; in those first mentioned the attention is fatigued by slight and monotonous sensory stimuli. It is not yet satisfactorily explained, however, how it comes about that mere talking produces exactly the same state as the other procedures. Experienced hypnotists assert that by these means a definite hypnotic change can be brought about in some eighty per cent of subjects. There is no way of telling beforehand, however, which subjects are hypnotizable and which are not. Illness is far from being one of the necessary preconditions of hypnosis: normal people are said to be particularly easy to hypnotize, while some neurotics can only be hypnotized with great difficulty and the insane are completely resistant. The hypnotic state exhibits a great variety of gradations. In its lightest degree the hypnotic subject is aware only of something like a slight insensibility, while the most extreme degree, which is marked by special peculiarities, is known as 'somnambulism', on account of its resemblance to the natural phenomenon of sleep-walking. But hypnosis is in no sense a sleep like our nocturnal sleep or like the sleep produced by drugs. Changes occur in it and mental functions are retained during it which are absent in normal sleep.

Some of the phenomena of hypnosis (for instance, alterations in muscular activity) possess a merely scientific interest. But the most significant indication of hypnosis, and the most important one from our point of view, lies in the hypnotic subject's attitude to his hypnotist. While the subject behaves to the rest of the external world as though he were asleep, that is, as though all his senses were diverted from it, he is *awake* in his relation to the person who hypnotized him; he hears and sees him alone, and him he understands and answers. This phenomenon, which is described as *rapport* in the case of hypnosis, finds a parallel in the way in which some people sleep - for instance, a mother who is nursing her baby. It is so striking that it may well lead us to an understanding of the relation between the hypnotic subject and the hypnotist.

But the fact that the subject's universe is, so to say, confined to the hypnotist is not the whole story. There is the further fact of the former's *docility* in relation to the latter: he becomes obedient and credulous - in the case of deep hypnosis, to an almost unlimited extent. And the manner in which this obedience and credulity are carried out reveals a characteristic of the hypnotic state, namely that in the hypnotized subject the influence of the mind over the body is extraordinarily increased. If the hypnotist says 'You can't move your arm', the arm drops motionless; the subject obviously tries with all his strength but is unable to move it. If the hypnotist says: 'Your arm's moving of its own accord, you can't stop it', the arm moves and the subject is seen making vain efforts to keep it still. The idea which the hypnotist has given to the subject by his words has produced in him precisely the mental-physical behaviour corresponding to the idea's content. This implies on the one hand obedience but on the other an increase in the physical influence of an idea. Words have once more regained their magic.

The same thing happens in the domain of sense perceptions. The hypnotist says: 'You see a snake; you're smelling a rose; you're listening to the loveliest music', and the hypnotic subject sees, smells and hears what is required of him by the idea that he has been given. How do we know that the subject really has these perceptions? It might be thought that he is only pretending to have them. But after all we have no reason for doubts on the point; for he behaves exactly as though he had them, he expresses all the appropriate emotions, and in some circumstances he can even describe his imaginary perceptions and experiences after the hypnosis is at an end. We then perceive that he has been seeing and hearing just as we see and hear in dreams - he has been 'hallucinating'. He was evidently so credulous in relation to the hypnotist that he was *convinced* that there must be a snake to be seen when the hypnotist told him so; and this conviction had such a strong effect on his body that he really saw the snake - a thing which, incidentally, can sometimes happen even to people who have not been hypnotized.

It may be remarked, by the way, that, outside hypnosis and in real life, credulity such as the subject has in relation to his hypnotist is shown only by a child towards his beloved parents, and that an attitude of similar subjection on the part of one person towards another has only one parallel, though a complete one - namely in certain love-relationships where there is extreme devotion. A combination of exclusive attachment and credulous obedience is in general among the characteristics of love.

Some further points may be mentioned in connection with the state of hypnosis. The words spoken by the hypnotist which have the magical results that I have described are known as a 'suggestion' and it has become customary to apply the term as well where there is merely an intention to produce a similar effect. Not only do the hypnotic subject's movements and feelings obey suggestions, but all his other mental activities; and he does not as a rule take any action on his own initiative. Hypnotic obedience can be employed in making a number of highly remarkable experiments, which afford a deep insight into the workings of the mind and produce in the observer an ineradicable conviction of the unsuspected power of the mind over the body. Just as a hypnotized subject can be obliged to see what is not there, so he can be forbidden to see what *is* there and is seeking to impress itself on his senses - some particular person, for instance. (This is known as a 'negative hallucination'.) The person in question then finds it impossible to attract the subject's attention by any kind of stimulation; he is treated as though he were 'thin air'. Again, a suggestion may be made to the subject to carry out some action a certain length of time after waking from hypnosis ('post-hypnotic suggestion'); the subject keeps to the allotted time and performs the suggested action in the middle of his waking state without being able to give any reason for it. If he is asked why he has done what he has, he will either refer to an obscure impulse which he was unable to resist, or he will invent some half-satisfactory excuse without remembering the real explanation - namely the suggestion he has been given.

The state of hypnosis is brought to an end without any difficulty by the hypnotist's authority asserted in the words: 'Wake up!' After the deepest hypnosis there is no recollection of anything that has been experienced during it under the hypnotist's influence. That portion of the subject's mental life remains cut off, as it were, from the rest. Other subjects retain a dream-like memory, and yet others remember everything but report that they have been under an irresistible mental compulsion.

The scientific gain brought to physicians and psychologists by a knowledge of the facts of hypnotism can scarcely be exaggerated. But in order to gauge the practical importance of the new discoveries we must put a physician in place of the hypnotist and a patient in place of the hypnotic subject. Hypnosis would then seem pre-ordained to fulfil all the physician's requirements, in so far as he seeks to act towards the patient as a 'mind-doctor'. Hypnosis endows the physician with an authority such as was probably never possessed by the priest or the miracle man, since it concentrates the subject's whole interest upon the figure of the physician; it does away with the autocratic power of the patient's mind which, as we have seen, interferes so capriciously with the influence of the mind over the body; it automatically produces an increase of the mind's control over the body, such as is normally to be observed only as an effect of the most powerful emotions; and, owing to the possibility of arranging that the instructions given to the patient during hypnosis shall only become manifest subsequently, in his normal state - owing, that is, to post-hypnotic suggestion -, hypnosis enables the physician to use the great power he wields during hypnosis in order to bring about changes in the patient in his waking condition. A simple pattern of procedure would thus seem to emerge for the purposes of mental treatment: the physician puts the patient into a state of hypnosis, he suggests to him (according to the particular circumstances) that he is not ill and that after waking he will not be aware of his symptoms. The physician then wakes the patient up and may feel confident that the suggestion has done its duty against the illness. And if a single application of this procedure were not sufficient, it could be repeated as many times as necessary.

There is only one consideration that might discourage the physician and the patient from making use of such a promising therapeutic method: the possibility that the advantages of hypnotism might be balanced by some damage - if, for instance, it left behind it a permanent disorder or weakness in the subject's mind. But enough experience has already been gained to set aside such doubts: single hypnotic treatments are completely harmless and even if they are frequently repeated they are on the whole without bad effects. Only one point is to be noticed: if circumstances demand a persistent use of hypnotism, the patient falls into a habit of hypnosis and dependence on the physician which cannot be among the purposes of the therapeutic procedure.

Thus hypnotic treatment really implies a great extension of medical power and consequently an advance in therapy. Every sufferer may be advised to entrust himself to it, so long as it is carried out by an experienced and trustworthy physician. Hypnosis should, however, be used in a manner different from what is usual to-day. As a rule this method of treatment is only embarked upon after every other method has failed and when the patient is already despondent and dejected. He has then to leave his own doctor, who cannot or does not employ hypnotism, and turn to a strange doctor, who as a rule does not or cannot employ anything else. Both practices are disadvantageous to the patient. The family doctor should himself be familiar with hypnotic procedure and he should make use of it from the first, as soon as he judges the illness and the patient appropriate for it. Wherever hypnotism can be employed it should be on a par with other therapeutic procedures and should not be regarded as a last resort or even as a descent from science to quackery. But hypnotism can be employed not only in all nervous conditions and in disorders due to the 'imagination', as well as for breaking morbid habits (such as alcoholism, morphine addiction, or sexual aberrations), but also in many organic diseases, even of an inflammatory nature, in which, though the underlying disorder persists, there is a prospect of relieving the symptoms (such as pains or impediments to movement) which are troubling the patient. The selection of cases for hypnotic treatment must depend entirely on the judgement of the physician.

The time has now come, however, to dissipate the notion that with the expedient of hypnosis a period of easy miracle-working has dawned for the physician. A number of circumstances must be taken into account which are calculated to lower our expectations from hypnotic therapy considerably, and to reduce to their proper proportions the hopes that may have been raised in patients. First and foremost, one of the basic assumptions turns out to be untenable: namely, that hypnosis makes it possible to deprive patients of the interfering autocratic element in their mental behaviour. In fact they retain it, and manifest it even in their attitude to the attempt to hypnotize them. It was stated above that some eighty per cent of people can be hypnotized; but that high figure is only reached by including among the positive cases any that show the slightest sign of being influenced. Really deep hypnoses, with complete tractability, such as are chosen as examples in describing the state, are actually rare or at all events not as frequent as one would wish from the therapeutic point of view. The impression made by this fact can, however, in turn be modified when it is borne in mind that depth of hypnosis and tractability to suggestions do not go *pari passu*; so that one often sees good suggestive results where there is no more than a slight hypnotic insensibility. But even if we consider hypnotic tractability independently, as being the more essential feature of the condition, it has to be admitted that different people show their idiosyncrasies by only letting themselves be influenced up to a certain degree of tractability, at which point they come to a halt. Thus different people show a very varying degree of suitability for hypnotic treatment. If it were possible to find a means by which all these various grades of the hypnotic state could be intensified to the point of complete hypnosis, the idiosyncrasies of patients would once more have been eliminated and the ideal of mental treatment would have been attained. But this advance has not yet been made; it still depends far more on the patient than on the physician with what degree of tractability a suggestion will be received - it depends once more, that is, upon the patient's choice.

And there is another, still more important consideration. In describing the very remarkable results of suggestion, people are only too ready to forget that here, as in all mental operations, relative size and strength must be taken into account. If we put a healthy person into deep hypnosis and then tell him to take a bite out of a potato under the impression that it is a pear, or if we tell him that he is meeting one of his acquaintances and must greet him as such, he is likely to prove completely tractable, because the hypnotized subject has no serious reason for resisting the suggestion. But in the case of other instructions - if, for instance, we ask a naturally modest girl to uncover herself or if we ask an honest man to steal some valuable object - we may already find the subject putting up a resistance, which may even go to the length of his refusing to obey the suggestion. This teaches us that even in the best hypnosis suggestion does not exercise unlimited power but only power of a definite strength. The hypnotic subject will make small sacrifices, but, just as though he were awake, he hesitates before making great ones. If, then, we are dealing with a patient, and urge him by suggestion to give up his illness, we perceive that this means a great sacrifice to him and not a small one. Here the power of suggestion is contending against the force which created the symptom, and maintains them, and experience shows that that force is of quite a different order of strength from hypnotic influences. The same patient who is perfectly tractable in putting himself into any dream-situation one may suggest to him (if it is not actually objectionable) may remain completely recalcitrant towards a suggestion which denies the reality of, let us say, an imaginary paralysis. There is the further fact, moreover, that precisely neurotic patients are for the most part bad hypnotic subjects, so that the struggle against the powerful forces by which the illness is rooted in the patient's mind has to be waged not by a complete hypnotic influence but only by a fragment of it.

Thus suggestion is not certain as a matter of course of defeating the illness as soon as hypnosis (even deep hypnosis) has been achieved. A further battle has to be fought, and its outcome is very often uncertain. A single hypnotic treatment will accordingly effect nothing against severe disturbances of mental origin. If, however, hypnosis is repeated, it loses some of the miraculous effect which the patient may perhaps have anticipated. A succession of hypnoses may eventually bring about by degrees the influence over the illness which was lacking at first, till in the end a satisfactory result is achieved. But a hypnotic treatment such as this may be just as tedious and wearisome as a treatment of any other kind.

There is yet another way in which the relative weakness of suggestion is betrayed as compared with the illnesses it has to combat. It is true that suggestion can bring about a cessation of the symptoms of an illness - but only for a short time. At the end of this time they return and have to be repelled once again by renewed hypnosis and suggestion. If this course of events is repeated often enough, it usually exhausts the patience both of the patient and the physician and ends in the abandonment of hypnotic treatment. These, too, are the cases in which the patient becomes dependent on the physician and a kind of addiction to hypnosis is established.

It is a good thing for patients to be aware of these weaknesses in hypnotic therapy and of the possibilities of disappointment in its use. The curative power of hypnotic suggestion is something real and it needs no exaggerated recommendation. On the other hand, it is not surprising that physicians, to whom hypnotic mental treatment promised so much more than it could give, are indefatigable in their search for other procedures, which would make possible a deeper, or at least a less unpredictable, influence on a patient's mind. It may safely be anticipated that systematic modern mental treatment, which is a quite recent revival of ancient therapeutic methods, will provide physicians with far more powerful weapons for the fight against illness. A deeper insight into the processes of mental life, the beginnings of which are based precisely on hypnotic experience, will point out the ways and means to this end.

PSYCHOPATHIC CHARACTERS ON THE STAGE
(1942 [1905 or 1906])

Intentionally left blank

PSYCHOPATHIC CHARACTERS ON THE STAGE

If, as has been assumed since the time of Aristotle, the purpose of drama is to arouse 'terror and pity' and so 'to purge the emotions', we can describe that purpose in rather more detail by saying that it is a question of opening up sources of pleasure or enjoyment in our emotional life, just as, in the case of intellectual activity, joking or fun open up similar sources, many of which that activity had made inaccessible. In this connection the prime factor is unquestionably the process of getting rid of one's own emotions by 'blowing off steam'; and the consequent enjoyment corresponds on the one hand to the relief produced by a thorough discharge and on the other hand, no doubt, to an accompanying sexual excitation; for the latter, as we may suppose, appears as a by-product whenever an affect is aroused, and gives people the sense, which they so much desire, of a raising of the potential of their psychical state. Being present as an interested spectator at a spectacle or play does for adults what play does for children, whose hesitant hopes of being able to do what grown-up people do are in that way gratified. The spectator is a person who experiences too little, who feels that he is a 'poor wretch to whom nothing of importance can happen', who has long been obliged to damp down, or rather displace, his ambition to stand in his own person at the hub of world affairs; he longs to feel and to act and to arrange things according to his desires - in short, to be a hero. And the playwright and actor enable him to do this by allowing him *to identify himself* with a hero. They spare him something, too. For the spectator knows quite well that actual heroic conduct such as this would be impossible for him without pains and sufferings and acute fears, which would almost cancel out the enjoyment. He knows, moreover, that he has only *one* life and that he might perhaps perish even in a *single* such struggle against adversity. Accordingly, his enjoyment is based on an illusion; that is to say, his suffering is mitigated by the certainty that, firstly, it is someone other than himself who is acting and suffering on the stage, and, secondly, that after all it is only a game, which can threaten no damage to his personal security. In these circumstances he can allow himself to enjoy being a 'great man', to give way without a qualm to such suppressed impulses as a craving for freedom in religious, political, social and sexual matters, and to 'blow off steam' in every direction in the various grand scenes that form part of the life represented on the stage.

Several other forms of creative writing, however, are equally subject to these same preconditions for enjoyment. Lyric poetry serves the purpose, more than anything, of giving vent to intense feelings of many sorts - just as was at one time the case with dancing. Epic poetry aims chiefly at making it possible to feel the enjoyment of a great heroic character in his hour of triumph. But drama seeks to explore emotional possibilities more deeply and to give an enjoyable shape even to forebodings of misfortune; for this reason it depicts the hero in his struggles, or rather (with masochistic satisfaction) in defeat. This relation to suffering and misfortune might be taken as characteristic of drama, whether, as happens in serious plays, it is only *concern* that is aroused, and afterwards allayed, or whether, as happens in tragedies, the suffering is actually realized. The fact that drama originated out of sacrificial rites (cf. the goat and the scapegoat) in the cult of the gods cannot be unrelated to this meaning of drama. It appeases, as it were, a rising rebellion against the divine regulation of the universe, which is responsible for the existence of suffering. Heroes are first and foremost rebels against God or against something divine; and pleasure is derived, as it seems, from the affliction of a weaker being in the face of divine might - a pleasure due to masochistic satisfaction as well as to direct enjoyment of a character whose greatness is insisted upon in spite of everything. Here we have a mood like that of Prometheus, but alloyed with a paltry readiness to let oneself be soothed for the moment by a temporary satisfaction.

Suffering of every kind is thus the subject-matter of drama, and from this suffering it promises to give the audience pleasure. Thus we arrive at a first precondition of this form of art: that it should not cause suffering to the audience, that it should know how to compensate, by means of the possible satisfactions involved, for the sympathetic suffering which is aroused. (Modern writers have particularly often failed to obey this rule.) But the suffering represented is soon restricted to *mental* suffering; for no one wants *physical* suffering who knows how quickly all mental enjoyment is brought to an end by the changes in somatic feeling that physical suffering brings about. If we are sick we have one wish only: to be well again and to be quit of our present state. We call for the doctor and medicine, and for the removal of the inhibition on the play of phantasy which has pampered us into deriving enjoyment even from our own sufferings. If a spectator puts himself in the place of someone who is physically ill he finds himself without any capacity for enjoyment or psychical activity. Consequently a person who is physically ill can only figure on the stage as a piece of stage property and not as a hero, unless, indeed, some peculiar physical aspects of his illness make psychical activity possible - such, for instance, as the sick man's forlorn state in the *Philoctetes* or the hopelessness of the sufferers in the class of plays that centre round consumptives.

People are acquainted with mental suffering principally in connection with the circumstances in which it is acquired; accordingly, dramas dealing with it require some event out of which the illness shall arise and they open with an exposition of this event. It is only an apparent exception that some plays, such as the *Ajax* and the *Philoctetes*, introduce the mental illness as already fully established; for in Greek tragedies, owing to the familiarity of the material, the curtain rises, as one might say, in the middle of the play. It is easy to give an exhaustive account of the preconditions governing an event of the kind that is here in question. It must be an event involving conflict and it must include an effort of will together with resistance. This precondition found its first and grandest fulfilment in a struggle against divinity. I have already said that a tragedy of this kind is one of rebellion, in which the dramatist and the audience take the side of the rebel. The less belief there comes to be in divinity, the more important becomes the *human* regulation of affairs; and it is this which, with increasing insight, comes to be held responsible for suffering. Thus the hero's next struggle is against human society, and here we have the class of *social* tragedies. Yet another fulfilment of the necessary precondition is to be found in a struggle between individual men. Such are tragedies of *character*, which exhibit all the excitement of an '*agon*', and which are best played out between outstanding characters who have freed themselves from the bond of human institutions - which, in fact, must have *two* heroes. Fusions between these two last classes, with a hero struggling against institutions embodied in powerful characters, are of course admissible without question. Pure tragedies of character lack the rebellious source of enjoyment, but this emerges once again no less forcibly in social dramas (in Ibsen for instance) than it did in the historical plays of the Greek classical tragedians.

Thus *religious* drama, *social* drama and drama of *character* differ essentially in the terrain on which the action that leads to the suffering is fought out. And we can now follow the course of drama on to yet another terrain, where it becomes *psychological* drama. Here the struggle that causes the suffering is fought out in the hero's mind itself - a struggle between different impulses, and one which must have its end in the extinction, not of the hero, but of one of his impulses; it must end, that is to say, in a renunciation. Combinations of any kind between this precondition and the earlier types are, of course, possible; thus institutions, for instance, can themselves be the cause of internal conflicts. And this is where we have tragedies of love; for the suppression of love by social culture, by human conventions, or the struggle between 'love and duty', which is so familiar to us in opera, are the starting-point of almost endless varieties of situations of conflict: just as endless, in fact, as the erotic day-dreams of men.

But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion from the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is *not* neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an *enjoyment* of the liberation but a *resistance* to it as well.

The first of these modern dramas is *Hamlet*. It has as its subject the way in which a man who has so far been normal becomes neurotic owing to the peculiar nature of the task by which he is faced, a man, that is, in whom an impulse that has hitherto been successfully suppressed endeavours to make its way into action. *Hamlet* is distinguished by three characteristics which seem important in connection with our present discussion. (1) The hero is not psychopathic, but only *becomes* psychopathic in the course of the action of the play. (2) The repressed impulse is one of those which are similarly repressed in all of us, and the repression of which is part and parcel of the foundations of our personal evolution. It is this repression which is shaken up by the situation in the play. As a result of these two characteristics it is easy for us to recognize ourselves in the hero: we are susceptible to the same conflict as he is, since 'a person who does not lose his reason under certain conditions can have no reason to lose'. (3) It appears as a necessary precondition of this form of art that the impulse that is struggling into consciousness, however clearly it is recognizable, is never given a definite name; so that in the spectator too the process is carried through with his attention averted, and he is in the grip of his emotions instead of taking stock of what is happening. A certain amount of resistance is no doubt saved in this way, just as, in an analytic treatment, we find derivatives of the repressed material reaching consciousness, owing to a lower resistance, while the repressed material itself is unable to do so. After all, the conflict in *Hamlet* is so effectively concealed that it was left to me to unearth it.

It may be in consequence of disregarding these three preconditions that so many other psychopathic characters are as unserviceable on the stage as they are in real life. For the victim of a neurosis is someone into whose conflict we can gain no insight if we first meet it in a fully established state. But, *per contra*, if we recognize the conflict, we forget that he is a sick man, just as, if he himself recognizes it, he ceases to be ill. It would seem to be the dramatist's business to induce the same illness in *us*; and this can best be achieved if we are made to follow the development of the illness along with the sufferer. This will be especially necessary where the repression does not already exist in us but has first to be set up; and this represents a step further than *Hamlet* in the use of neurosis on the stage. If we are faced by an unfamiliar and fully established neurosis, we shall be inclined to send for the doctor (just as we do in real life) and pronounce the character inadmissible to the stage.

This last mistake seems to occur in Bahr's *Die Andere*, apart from a second one which is implicit in the problem presented in the play - namely, that it is impossible for us to put ourselves with conviction into the position of believing that one particular person has a prescriptive right to give the girl complete satisfaction. So that her case cannot become ours. Moreover, there remains a third mistake: namely that there is nothing left for us to discover and that our entire resistance is mobilized against this predetermined condition of love which is so unacceptable to us. Of the three formal preconditions that I have been discussing, the most important seems to be that of the diversion of attention.

In general, it may perhaps be said that the neurotic instability of the public and the dramatist's skill in avoiding resistances and offering fore-pleasures can alone determine the limits set upon the employment of abnormal characters on the stage.

JOKES AND THEIR RELATION TO THE UNCONSCIOUS

JOKES AND THEIR RELATION TO THE UNCONSCIOUS

A. ANALYTIC PART

I

INTRODUCTION

Anyone who has at any time had occasion to enquire from the literature of aesthetics and psychology what light can be thrown on the nature of jokes and on the position they occupy will probably have to admit that jokes have not received nearly as much philosophical consideration as they deserve in view of the part they play in our mental life. Only a small number of thinkers can be named who have entered at all deeply into the problems of jokes. Among those who have discussed jokes, however, are such famous names as those of the novelist Jean Paul (Richter) and of the philosophers Theodor Vischer, Kuno Fischer and Theodor Lipps. But even with these writers the subject of jokes lies in the background, while the main interest of their enquiry is turned to the more comprehensive and attractive problem of the comic.

The first impression one derives from the literature is that it is quite impracticable to deal with jokes otherwise than in connection with the comic.

According to Lipps (1898),¹ a joke is 'something comic which is entirely subjective' - that is, something comic 'which we produce, which is attached to action of ours as such, to which we invariably stand in the relation of subject and never of object, not even of voluntary object' (ibid., 80). This is explained further by a remark to the effect that in general we call a joke 'any conscious and successful evocation of what is comic, whether the comic of observation or of situation' (ibid., 78).

¹ It is this book that has given me the courage to undertake this attempt as well as the possibility of doing so.
